It must be evident, that the expence and labour of setting in the above manner by the hand, will render it impracticable upon a large scale so as to be productive of any utility. A correspondent of the Bath Society, therefore (Robert Bogle, Esq; of Daldowin, near Glasgow), with a view to extend the practice, has proposed the use of the harrow and roller until some better implements be invented. This method occurred to him from attending to the practice usual with farmers on certain occasions, of harrowing their fields after the grain is sprung up. Upon investigating the principles upon which these practices are founded, he found them confined merely to that of pulverising the earth, without any attention to Mr Miller's doctrine. They said, "that after very heavy rains, and then excessive dry weather, the surface of their lands were apt to be caked, the tender fibres of the young roots were thereby prevented from pushing, and of course the vegetation was greatly obstructed; in such instances, they found very great benefit from harrowing and rolling."

131
Method proposed by Mr Bogle.

These principles he acknowledges to be well founded, so far as relates to pulverising; but contends, that the benefit arising from harrowing and rolling is not derived from pulverizing entirely, but also from subdividing and enabling the plants to tiller (as it is termed). "The harrow (he observes) certainly breaks the incrustation on the surface, and the roller crumbles the clods; but it is also obvious, that the harrow removes a great many of the plants from their original stations; and that if the corn has begun to tiller at the time it is used, the roots will be, in many instances, subdivided, and then the application of my system of divisibility comes into play. The roller then serves to plant the roots which have been torn up by the harrow."

132
Objections.

But on this the Society observe, that the teeth of a harrow are too large to divide roots so small and tenacious as are those of grain; and whenever such roots (however tillered) stand in the line any tooth makes, they will, if small, be only turned on one side by the earth yielding to their lateral pressure, or, if large, the whole root will probably be drawn out of the ground. The principal uses, therefore, derived from harrowing and rolling these crops are, opening the soil between the plants, earthing them up, breaking the clods, and closing the earth about their roots.

In a subsequent letter, Mr Bogle, without contesting these points, further urges the scheme of propagating wheat by dividing and transplanting its roots. "I have conversed (says he) much with many practical farmers, who all admit that my plan has the appearance not only of being practical, but advantageous. I have also seen in the ninth number of Mr Young's Annals of Agriculture, the account of an experiment which strongly corroborates my theory. It was made by the Rev. Mr Pike of Edmonton. From this, and other experiments

Practice. experiments which have been made under my own eye, I foresee clearly, that the system is practicable, and will certainly be productive of great benefit, should it become general. Besides the saving of nine-tenths of seed in the land sown broad-cast, other very important advantages will attend the setting out of wheat from a seed-bed, such as an early crop; the certainty of good crops; rendering a summer fallow unnecessary; saving dung; and having your wheat perfectly free from weeds without either hand or horse-hoeing. Five hundred plants in April produced almost a bushel of grain. My gardener says, he can set one thousand plants in a day, which is confirmed by the opinion of two other gardeners. Mr Miller found no difference in the produce of what was planted on lands that had dung, and on what had none, except where the land was improper for wheat at all."

133
Practicability of the scheme ascertained.

134
Bath Society's observations.

135
Further observations of Mr Bogle.

On this letter we have the following note by the society: "Mr Bogle will see, by the society's premium-book this year, that by having offered several premiums for experiments of the kind he so earnestly recommends, we wish to have his theory brought to the test of practice. Our reason for this, as well as for printing Mr B's letter, was rather to excite decisive trials by ingenious persons, than from any expectation of the practice ever becoming a general one. General, indeed, it never can be. A sufficient number of hands could not be found to do it. Unkindly seasons at the time of transplanting and dividing the roots would frequently endanger and injure, if not destroy the crops. But admitting the mode generally practicable, we very much doubt whether all the advantages he has enumerated would be derived from this mode of culture. Why should dividing and transplanting the roots of wheat cause the crop to be early, or afford a *certainty* of its being a *good one*? We cannot think that *less manure* is necessary in this method, than either in drilling or broad-cast; nor can we by any means admit, that such crops would "be perfectly free from weeds without either hand or horse-hoeing." We readily agree with Mr Bogle, that by this mode of culture on a general scale, an immense quantity of seed-corn would be annually saved to the nation; and in this, we believe, the advantage, were it practicable, would principally consist."

Upon the same subject, and that of harrowing all kinds of corn, we are informed, Mr Bogle afterwards communicated to the Society his thoughts more at large, together with authentic accounts which were made at his instance, and which were attended with very great success. These, however, were received too late for publication in the last (3d) volume of their papers. But the Society, conceiving his system may be attended with considerable advantages if brought into general practice, have given, at the end of the volume, a few of his leading principles. Mr Bogle states, 1. That he has known many instances of very great crops having been obtained by harrowing fields of corn after they were sprouted; and therefore recommends the practice very warmly.

2. That he has also received an authentic account of one instance where the same good effects were produced by ploughing the field.

3. On the system of transplanting, he states, that a very great proportion of the seed will be saved, as a farmer may have a nursery, or small patch of plants,

from which his fields may be supplied; he calculates that one acre will yield plants sufficient for 100 acres.

4. That a very great increase of crops may be obtained by this method, probably a double crop, nay perhaps a triple quantity of what is reaped either by drilling, or by the broad-cast husbandry.

5. That a great part of the labour may be performed by infirm men and women, and also by children, who are at present supported by the parish charity; and that of course the poor's rates may be considerably reduced.

6. That the expence will not exceed from 20s. to 30s. per acre, if the work be performed by able-bodied men and women; but that it will be much lower, if that proportion of the work which may be done by employing young boys and girls should be allotted to them.

7. That in general he has found the distance of nine inches every way a very proper distance for setting out the plants at; but recommends them to be tried at other spaces, such as six, eight, or even 12 inches.

8. That he conceives an earlier crop may be obtained in this manner than can be obtained by any other mode of cultivation.

9. That a clean crop may also be procured in this way, because if the land be ploughed immediately before the plants are set out, the corn will spring much quicker from the plants than the weeds will do from their seeds, and the corn will thereby bear down the growth of the weeds.

10. That such lands as are overflowed in the winter and spring, and are of course unfit for sowing with wheat in the autumn, may be rendered fit for crops of wheat by planting them in the spring, or even in the summer.

11. That he has known instances of wheat being transplanted in September, October, November, February, March, April, and even as late as the middle of May, which have all answered very well.

12. That he has known an early kind of wheat sown as late as the middle of May, which has ripened in very good time; and from that circumstance he conceives, if the plants should be taken from that early kind, the season of transplanting might be prolonged at least till the 1st of July, perhaps even later.

13. That he has reason to think wheat, oats, and barley, are not annuals, but are perennials, provided they are eaten down by cattle and sheep, or are kept low by the scythe or sickle; and are prevented from spindling or coming to the ear.

14. That one very prevalent motive with him in prosecuting this plan, is, that he is of opinion it may enable Government to devise means of supporting the vagrant poor, both old and young, who are now to be met with every where, both in towns and in the country, and who are at present a burden on the community: but if such employment could be struck out for them, a comfortable subsistence might be provided for them by means of their own labour and industry; and not only save the public and private charitable contributions, but may also render that class of people useful and profitable subjects; instead of their remaining in a useless, wretched, and perhaps a profligate and vicious course of life.

Practice.

Lastly, Mr Bogle has hinted at a secondary object which

Practice. which he has in view, from this mode of cultivation, which he apprehends may in time, with a small degree of attention, prove extremely advantageous to agriculture.—It is, that in the first place, the real and intrinsic value of different kinds of grain may be more accurately ascertained by making a comparison of it with a few plants of each kind set out at the same time, than can be done when sown in drills or broad-cast; and when the most valuable kinds of wheat, oats, or barley, are discovered, he states, that in a very short time (not exceeding four or five years) a sufficient quantity of that valuable kind may be procured to supply the kingdom with seed from a single grain of each kind; for he calculates, that 47,000 grains of wheat may be produced by divisibility in two years and three months.

136
Observation of the Bath Society.

Upon these propositions the Society observes, "That although Mr. Bogle appears to be too sanguine in his expectations of seeing his plan realized in *general practice*, it certainly merits the attention of Gentlemen Farmers. We wish them to make fair experiments, and report their success. Every grand improvement has been, and ever will be, progressive. They must necessarily originate with gentlemen; and thence the circle is extended by almost imperceptible degrees over provinces and countries. At all events, Mr. Bogle is justly intitled to the thanks of the Society, and of the public, for the great attention he has paid to the subject."

2. O A T S.

137
Effect of frost upon tilled land.

As winter-ploughing enters into the culture of oats, we must remind the reader of the effect of frost upon tilled land. Providence has neglected no region intended for the habitation of man. If in warm climates the soil be meliorated by the sun, it is no less meliorated by frost in cold climates. Frost acts upon water, by expanding it into a larger space. Frost has no effect upon dry earth; witness sand, upon which it makes no impression. But upon wet earth it acts most vigorously: it expands the moisture, which requiring more space puts every particle of the earth out of its place, and separates them from each other. In that view, frost may be considered as a plough superior to any that is made, or can be made, by the hand of man: its action reaches the minutest particles; and, by dividing and separating them, it renders the soil loose and friable. This operation is the most remarkable in tilled land, which gives free access to frost. With respect to clay-soil in particular, there is no rule in husbandry more essential than to open it before winter in hopes of frost. It is even advisable in a clay-soil to leave the stubble rank; which, when ploughed in before winter, keeps the clay loose, and admits the frost into every cranny.

To apply this doctrine, it is dangerous to plough clay-soil when wet; because water is a cement for clay, and binds it so as to render it unfit for vegetation. It is, however, less dangerous to plough wet clay before winter than after. A succeeding frost corrects the bad effects of such ploughing; a succeeding drought increases them.

138
Culture of oats.

The common method is, to sow oats on new-ploughed land in the month of March, as soon as the ground is tolerably dry. If it continue wet all the month of March, it is too late to venture them after. It is much

better to summer-fallow, and to sow wheat in the autumn. But the preferable method, especially in clay-soil, is to turn over the field after harvest, and to lay it open to the influences of frost and air, which lessen the tenacity of clay, and reduce it to a free mould. The surface-soil by this means is finely mellowed for reception of the seed; and it would be a pity to bury it by a second ploughing before sowing. In general, the bulk of clay-soils are rich; and skilful ploughing without dung, will probably give a better crop, than unskilful ploughing with dung.

Practice.

Hitherto of natural clays. We must add a word of carse-clays which are artificial, whether left by the sea, or swept down from higher grounds by rain. The method commonly used of dressing carse-clay for oats, is, not to stir it till the ground be dry in the spring, which seldom happens before the first of March, and the seed is sown as soon after as the ground is sufficiently dry for its reception. Frost has a stronger effect on such clays than on natural clay. And if the field be laid open before winter, it is rendered so loose by frost as to be soon drenched in water. The particles at the same time are so small, as that the first drought in spring makes the surface cake or crust. The difficulty of reducing this crust into mould for covering the oat-seed, has led farmers to delay ploughing till the month of March. But we are taught by experience, that this soil ploughed before winter, is sooner dry than when the ploughing is delayed till spring; and as early sowing is a great advantage, the objection of the superficial crusting is easily removed by the first harrow above described, which will produce abundance of mould for covering the seed. The ploughing before winter not only procures early sowing, but has another advantage: the surface-soil that had been mellowed during winter by the sun, frost, and wind, is kept above.

The dressing a loamy soil for oats differs little from dressing a clay soil, except in the following particular, that being less hurt by rain, it requires not high ridges, and therefore ought to be ploughed crown and furrow alternately.

Where there is both clay and loam in a farm, it is obvious from what is said above, that the ploughing of the clay after harvest ought first to be dispatched. If both cannot be overtaken that season, the loam may be delayed till the spring with less hurt.

Next of a gravelly soil; which is the reverse of clay, as it never suffers but from want of moisture. Such a soil ought to have no ridges; but be ploughed circularly from the centre to the circumference, or from the circumference to the centre. It ought to be tilled after harvest: and the first dry weather in spring ought to be laid hold of to sow, harrow, and roll; which will preserve it in sap.

The culture of oats is the simplest of all. That grain is probably a native of Britain: it will grow on the worst soil with very little preparation. For that reason, before turnip was introduced, it was always the first crop upon land broken up from the state of nature.

Upon such land, may it not be a good method, to build upon the crown of every ridge, in the form of a wall, all the surface-earth, one sod above another, as in a fold for sheep? After standing in this form all the summer and winter, let the walls be thrown down, and the ground prepared for oats. This will secure

^{Practice.} secure one or two good crops; after which the land may be dunged for a crop of barley and grafs-seeds. This method may answer in a farm where manure is scanty.

3. BARLEY.

^{I39}
Culture of
barley.
^{I40}
Ribbing.
^{I41}
A better
method.

THIS is a culmiferous plant that requires a mellow foil. Upon that account, extraordinary care is requisite where it is to be sown in clay. The land ought to be stirred immediately after the foregoing crop is removed, which lays it open to be mellowed with the frost and air. In that view, a peculiar sort of ploughing has been introduced, termed *ribbing*; by which the greatest quantity of surface possible is exposed to the air and frost. The obvious objection to this method is, that half of the ridge is left unmoved. And to obviate that objection, the following method is offered, which moves the whole foil, and at the same time exposes the same quantity of surface to the frost and air. As soon as the former crop is off the field, let the ridges be gathered with as deep a furrow as the foil will admit, beginning at the crown and ending at the furrows. This ploughing loosens the whole foil, giving free access to the air and frost. Soon after, begin a second ploughing in the following manner. Let the field be divided by parallel lines cross the ridges, with intervals of 30 feet or so. Plough once round an interval, beginning at the edges, and turning the earth toward the middle of the interval; which covers a foot or so of the ground formerly ploughed. Within that foot plough another round similar to the former; and after that, other rounds, till the whole interval be finished, ending at the middle. Instead of beginning at the edges, and ploughing toward the middle, it will have the same effect to begin at the middle and to plough toward the edges. Plough the other intervals in the same manner. As by this operation the furrows of the ridges will be pretty much filled up, let them be cleared and water-furrowed without delay. By this method, the field will be left waving like a plot in a kitchen-garden, ridged up for winter. In this form, the field is kept perfectly dry; for beside the capital furrows that separate the ridges, every ridge has a number of cross furrows that carry the rain instantly to the capital furrows. In hanging grounds retentive of moisture, the parallel lines above mentioned ought not to be perpendicular to the furrows of the ridges, but to be directed a little downward, in order to carry rain-water the more hastily to these furrows. If the ground be clean, it may lie in that state winter and spring, till the time of seed-furrowing. If weeds happen to rise, they must be destroyed by ploughing, or brakeing, or both; for there cannot be worse husbandry, than to put seed into dirty ground.

^{I42}
Advantages
of this
method.

This method resembles common ribbing in appearance, but is very different in reality. As the common ribbing is not preceded by a gathering furrow, the half of the field is left untilled, compact as when the former crop was removed, impervious in a great measure to air or frost. The common ribbing at the same time lodges the rain-water on every ridge, preventing it from descending to the furrows; which is hurtful in all soils, and poisonous in a clay foil. The *stitching* here described, or *ribbing*; if you please to call it so,

^{Practice.} prevents these noxious effects. By the two ploughings the whole foil is opened, admitting freely air and frost; and the multitude of furrows lays the surface perfectly dry, giving an early opportunity for the barley-feed.— But further, as to the advantage of this method: When it is proper to sow the seed, all is laid flat with the brake, which is an easy operation upon foil that is dry and pulverized; and the seed-furrow which succeeds, is so shallow as to bury little or none of the surface-earth: whereas the stirring for barley is commonly done with the deepest furrow; and consequently buries all the surface-foil that was mellowed by the frost and air. Nor is this method more expensive; because the common ribbing must always be followed with a stirring furrow, which is saved in the method recommended. Nay, it is less expensive; for after common ribbing, which keeps in the rain water, the ground is commonly so fouled, as to make the stirring a laborious work.

It is well known that barley is less valuable when it does not ripen equally; and that barley which comes up speedily in a dusky foil, must gain a great advantage over seed-weeds. Therefore, first take out about one-third of the contents of the sacks of feed barley or bear, to allow for the swelling of the grain. Lay the sacks with the grain to steep in clean water; let it lie covered with it for at least 24 hours. When the ground is so dry as at present, and no likelihood of rain for 10 days, it is better to lie 36 hours. Sow the grain wet from steeping, without any addition of powdered quick-lime, which, though often recommended in print, can only poison the seed, suck up part of its useful moisture, and burn the hands of the sower. The seed will scatter well, as clean water has no tenacity; only the sower must put in a fourth or a third more seed in bulk than usual of dry grain, as the grain is swelled in that proportion: harrow it in as quickly as possible after it is sown; and though not necessary, give it the benefit of fresh furrow, if convenient. You may expect it up in a fortnight at farthest.

The following experiment by a correspondent of the Bath Society being considered as a very interesting one, is here subjoined.

^{I44}
Important
experiments
on
feed-barley.

“The last spring (1783) being remarkably dry, I soaked my feed-barley in the black water taken from a reservoir which constantly receives the draining of my dung-heap and stables. As the light corn floated on the top, I skimmed it off, and let the rest stand 24 hours. On taking it from the water, I mixed the seed grain with a sufficient quantity of sifted wood-ashes, to make it spread regularly, and sowed three fields with it. I began sowing the 16th, and finished the 23d of April. The produce was 60 bushels per acre, of good clean barley, without any *small* or *green* corn, or weeds at harvest. No person in this country had better grain.

I sowed also several other fields with the same seed dry, and without any preparation; but the crop, like those of my neighbours, was very poor; not more than twenty bushels per acre, and much mixed with *green* corn and weeds when harvested. I also sowed some of the feed dry on one ridge in each of my former fields, but the produce was very poor in comparison of the other parts of the field.”

Where the land is in good order, and free of weeds, April

Practice.

145
Time of
fowing.

April is the month for fowing barley. Every day is proper, from the first to the last.

The dressing loamy soil and light soil for barley, is the same with that described; only that to plough dry is not altogether so essential as in dressing clay-soil. Loam or sand may be stirred a little moist: better, however, delay a week or two, than to stir a loam when moist. Clay must never be ploughed moist, even tho' the season should escape altogether. But this will seldom be necessary; for not in one year of 20 will it happen, but that clay is dry enough for ploughing some time in May. Frost may correct clay ploughed wet after harvest; but ploughed wet in the spring, it unites into a hard mass, not to be dissolved but by very hard labour.

746
Miscellaneous
observations
concerning the
cultivation
of barley.

On the cultivation of this grain we have the following observations by a Norfolk farmer.

The best soil, he observes, is that which is dry and healthy, rather light than stiff, but yet of sufficient tenacity and strength to retain the moisture. On this kind of land the grain is always the best bodied and coloured, the nimblest in the hand, and has the thinnest rind. These are qualities which recommend it most to the maltster. If the land is poor, it should be dry and warm; and when so, it will often bear better corn than richer land in a cold and wet situation.

In the choice of your seed, it is needful to observe, that the best is of a pale lively colour, and brightish cast, without any deep redness or black tinge at the tail. If the rind be a little shrivelled, it is the better; for that slight shrivelling proves it to have a thin skin, and to have sweated in the mow. The necessity of a change of seed by not sowing two years together what grew on the same soil, is not in any part of husbandry more evident than in the culture of this grain, which, if not frequently changed, will grow coarser and coarser every succeeding year.

It has generally been thought that seed-barley would be benefited by steeping; but liming it has, in many instances, been found prejudicial. Sprinkling a little foot with the water in which it is steeped has been of great service, as it will secure the seed from insects. In a very dry seed-time, barley that has been wetted for malting, and begins to sprout, will come up sooner, and produce as good a crop as any other.

If you sow after a fallow, plough three times at least. At the first ploughing, lay your land up in small ridges, and let it remain so during the winter, for the frost to mellow it; the second ploughing should be the beginning of February. In March split the ridges, and lay the land as flat as possible, at the same time harrowing it fine. But in strong wet lands (if you have no other for barley) lay it round, and make deep furrows to receive the water.

"I have often (continues he), taken the following method with success: On lands tolerably manured, I sowed clover with my barley, which I reaped at harvest; and fed the clover all the following winter, and from spring to July, when I fallowed it till the following spring, and then sowed it with barley and clover as before. Repeating this method every year I had very large crops, but would not recommend this practice on poor light land.

"We sow on our lightest lands in April, on our moist lands in May; finding that those lands which are

the most subject to weeds produce the best crops when sown late. Practice.

"The common method is to sow the barley-feed broad-cast at two sowings; the first harrowed in once, the second twice; the usual allowance from three to four bushels per acre. But if farmers could be prevailed on to alter this practice, they would soon find their account in it. Were only half the quantity sown equally, the produce would be greater, and the corn less liable to lodge: For when corn stands very close, the stalks are drawn up weak; and on that account are less capable of resisting the force of winds, or supporting themselves under heavy rains.

"From our great success in setting and drilling wheat, some of our farmers tried these methods with barley; but did not find it answer their expectations, except on very rich land.

"I have myself had 80 stalks on one root of barley, which all produced good and long ears, and the grain was better than any other; but the method is too expensive for general practice. In poor land, sow thin, or your crop will be worth little. Farmers who do not reason on the matter, will be of a different opinion; but the fact is indisputable."

When the barley is sowed and harrowed in, he advises that the land be rolled after the first shower of rain, to break the clods. This will close the earth about the roots, which will be a great advantage to it in dry weather.

When the barley has been up three weeks or a month, it is a very good way to roll it again with a heavy roller, which will prevent the sun and air from penetrating the ground to the injury of the roots. This rolling, before it branches out, will also cause it to tiller into a greater number of stalks; so that if the plants be thin, the ground will be thereby filled, and the stalks strengthened.

If the blade grows too rank, as it sometimes will in a warm wet spring, mowing is a much better method than feeding it down with sheep; because the scythe takes off only the rank tops, but the sheep being fond of the sweet end of the stalk next the root, will often bite so close as to injure its future growth.

4. BUCK-WHEAT.

THE uses of this plant have been mentioned in the preceding part, n^o 46. It delights in a mellow sandy soil; but succeeds well in any dry loose healthy land, and moderately so in a free loamy stone-brash. A stiff clay is its aversion, and it is entirely labour lost to sow it in wet poachy ground. The proper season for sowing is from the last week of May or the beginning of June. It has been sown, however, so early as the beginning of April, and so late as the 22d of July, by way of experiment; but the latter was rather extreme to be chosen, and the former was in danger from frost. In an experiment upon a small piece of ground, the grain of two different crops was brought to maturity in the summer 1787.—After spring feedings, a crop of turnip-rooted cabbage, or vetches, there will be sufficient time to sow the land with buck-wheat. Probably, in hot dry summers, a crop of vetches might even be mown for hay early enough to introduce a crop of this grain after it.

In the year 1780, about seven acres of a sandy soil

Practice. on Brington Common (A), having been first tolerably well cleaned from brambles, furze, &c. received one ploughing. To reduce the irregularities of the surface, it was rolled; and on the 9th of June in that year, two bushels and a half of buck-wheat per acre sown, the ground rolled again without harrowing.

Advantages of this cropping. The vegetation appeared in five or six days, as is constantly the case be the weather wet or dry. The growth was so rapid, that the fern, with which this land greatly abounded, was completely kept under. About the middle of September the crop was mown, but by reason of a great deal of rain about that time, it was not secured until the beginning of October; hence a loss of great part of the grain by shedding, as well as some eaten by birds. However, there were saved about 24 Winchester bushels per acre; and, notwithstanding its long exposure to the weather, received no sort of damage, only perhaps that the finest and most perfect grain was the first to fall from the plant. The ground after this had almost the appearance of a fallow, and was immediately ploughed.

When it had lain a moderate time to meliorate, and to receive the influences of the atmosphere, it was harrowed, sown with Lammas wheat, and ploughed in under furrow, in a contrary direction to the first ploughing. Thus a piece of land, which in the month of April was altogether in a state of nature, in the following November was seen under a promising crop of what is well styled the king of grain, and this without the aid of manure, or of any very great degree of tillage. Nor was the harvest by any means deficient; for several persons conversant in such things estimated the produce from 26 to 30 bushels per acre. As soon as the wheat crop was taken off, the ground had one ploughing, and on the first of September following was sown with turnip-seed. The turnips were not large, but of an herbage so abundant as in the following spring to support 120 ewes with their lambs, which were fed on it by folding four weeks. After this it was manured with a composition of rotten dung and natural earth, about 20 putt loads per acre, and planted with potatoes. The crop sold for L. 138, besides a considerable number used in the family, and a quantity reserved with which ten acres were planted the following season. The ensuing autumn it was again sown with wheat, and produced an excellent crop. In the spring of 1784, it was manured and planted with potatoes, as in the preceding instance; the crop (tho' tolerably good) by no means equal to the former, producing about 100 sacks per acre only. In spring 1785, the land was now for a third time under a crop of wheat, it being intended to try how far this mode of alternate cropping, one year with potatoes and another with wheat, may be carried.

From the success of the preceding and other experiments, by Nehemiah Bartley, Esq; of Bristol, as detailed in the Bath Society Papers, it would seem, that the culture of this plant ought in many cases to be adopted instead of a summer-fallowing: for the crop produced appears not only to be so much clear gain in respect to such practice, but also affords a considerable quantity of straw for fodder and manure; beside that

a summer-fallowing is far from being so advantageous **Practice.** a preparation for a succeeding crop.

5. BEANS.

Culture of beans. The properest soil for beans is a deep and moist clay. There was lately introduced into Scotland a method of sowing beans with a drill-plough, and horse-hoeing the intervals; which, beside affording a good crop, is a dressing to the ground. But as that method is far from being general, we keep in the common track.

As this grain is early sown, the ground intended for it should be ploughed before winter, to give access to the frost and air; beneficial in all soils, and necessary in a clay soil. Take the first opportunity after January when the ground is dry, to loosen the soil with the harrow first described, till a mould be brought upon it. Sow the seed, and cover it with the second harrow. The third will smooth the surface, and cover the seed equally. These harrows make the very best figure in sowing beans; which ought to be laid deep in the ground, not less than six inches. In clay soil, the common harrows are altogether insufficient. The soil, which has rested long after ploughing, is rendered compact and solid: the common harrows skim the surface: the seed is not covered; and the first hearty shower of rain lays it above ground. Where the farmer overtakes not the ploughing after harvest, and is reduced to plough immediately before sowing, the plough answers the purpose of the first harrow; and the other two will complete the work. But the labour of the first harrow is ill saved; as the ploughing before winter is a fine preparation, not only for beans, but for grain of every kind. If the ground ploughed before winter happen by superfluity of moisture to cake, the first harrow going along the ridges, and crossing them, will loosen the surface, and give access to the air for drying. As soon as the ground is dry, sow without delaying a moment. If rain happen in the interim, there is no remedy but patience till a dry day or two come.

Carse-clay, ploughed before winter, seldom fails to cake. Upon that account, a second ploughing is necessary before sowing; which ought to be performed with an ebb furrow, in order to keep the frost-mould as near the surface as possible. To cover the seed with the plow is expressed by the phrase *to sow under furrow*. The clods raised in this ploughing are a sort of shelter to the young plants in the chilly spring-months.

The foregoing method will answer for loam. And as for a sandy or gravelly soil, it is altogether improper for beans.

Though we cannot approve the horse-hoeing of beans, with the intervals that are commonly allotted for turnip, yet we would strongly recommend the drilling them at the distance of 10 or 12 inches, and keeping the intervals clean of weeds. This may be done by hand-hoeing, taking opportunity at the same time to lay fresh soil to the roots of the plants. But as this is an expensive operation, and hands are not always to be got, a narrow plough, drawn by a single horse, might be used, with a mould-board on each side to scatter the earth.

(A) A very rough piece of land, at that time just inclosed.

Practice. earth upon the roots of the plants. This is a cheap and expeditious method: it keeps the ground clean; and nourishes the plants with fresh soil.

As beans delight in a moist soil, and have no end of growing in a moist season, they cover the ground totally when sown broadcast, keep in the dew, and exclude the sun and air: the plants grow to a great height; but carry little seed, and that little not well ripened. This displays the advantage of drilling; which gives free access to the sun and air, dries the ground, and affords plenty of ripe seed.

6. PEASE.

150
Culture of
pease.

PEASE are of two kinds; the white, and the gray. The cultivation of the latter only belongs to this place.

There are two species of the gray kind, distinguished by their time of ripening. One ripens soon, and for that reason is termed *hot seed*: the other, which is slower in ripening, is termed *cold seed*.

Pease, a leguminous crop, is proper to intervene between two culmiferous crops; less for the profit of a pease-crop, than for meliorating the ground. Pease, however, in a dry season, will produce six or seven bolls each acre; but, in an ordinary season, they seldom reach above two, or two and a half. Hence, in a moist climate, which all the west of Britain is, red clover seems a more beneficial crop than pease; as it makes as good winter-food as pease, and can be cut green thrice during summer.

A field intended for cold seed ought to be ploughed in October or November; and in February, as soon as the ground is dry, the seed ought to be sown on the winter-furrow. A field intended for hot seed ought to be ploughed in March or April, immediately before sowing. But if infested with weeds, it ought to be also ploughed in October or November.

Pease laid a foot below the surface will vegetate; but the most approved depth is six inches in light soil, and four inches in clay soil; for which reason, they ought to be sown under furrow when the ploughing is delayed till spring. Of all grain, beans excepted, they are the least in danger of being buried.

Pease differ from beans, in loving a dry soil and a dry season. Horse-hoeing would be a great benefit, could it be performed to any advantage; but pease grow expeditiously, and soon fall over and cover the ground, which bars ploughing. Horse-hoeing has little effect when the plants are new sprung; and when they are advanced to be benefited by that culture, their length prevents it. Fast growing at the same time is the cause of their carrying so little seed: the seed is buried among the leaves; and the sun cannot penetrate to make it grow and ripen. The only practicable remedy to obtain grain, is thin sowing; but thick sowing produces more straw, and mellows the ground more. Half a boll for an English acre may be reckoned thin sowing; three firlots, thick sowing.

Notwithstanding what is said above, Mr Hunter, a noted farmer in Berwickshire, began some time ago to sow all his pease in drills; and never failed to have great crops of corn as well as of straw. He sowed double rows at a foot interval, and two feet and an half between the double rows, which admit horse-hoeing. By that method, he had also good crops of beans on light land.

N^o 8.

Pease and beans mixed are often sown together, in order to catch different seasons. In a moist season, the beans make a good crop; in a dry season, the pease. **Practice.**

The growth of plants is commonly checked by drought in the month of July; but promoted by rain in August. In July, grass is parched; in August, it recovers verdure. Where pease are so far advanced in the dry season as that the seed begins to form, their growth is indeed checked, but the seed continues to fill. If only in the blossom at that season, their growth is checked a little; but they become vigorous again in August, and continue growing without filling till stopped by frost. Hence it is, that cold seed, which is early sown, has the best chance to produce corn: hot seed, which is late sown, has the best chance to produce straw.

The following method is practised in Norfolk, for sowing pease upon a dry light soil, immediately opened from pasture. The ground is pared with a plough extremely thin, and every sod is laid exactly on its back. In every sod a double row of holes is made. A peadroit in every hole lodges in the stay'd ground immediately below the sod, thrusts its roots horizontally, and has sufficient moisture. This method enabled Norfolk farmers, in the barren year 1740, to furnish white pease at 12s. per boll.

II. Plants cultivated for Roots. [See also Art. III.]

I. TURNIP.

TURNIP delights in a gravelly soil; and there it can be raised to the greatest perfection, and with the least hazard of miscarrying. At the same time, there is no soil but will bear turnip when well prepared. **151**
Culture of
turnip.

No person ever deserved better of a country, than he who first cultivated turnip in the field. No plant is better fitted for the climate of Britain, no plant prospers better in the coldest part of it, and no plant contributes more to fertility. In a word, there has not for two centuries been introduced into Britain a more valuable improvement.

Of all roots, turnip requires the finest mould; and to that end, of all harrows frost is the best. In order to give access to frost, the land ought to be prepared by ribbing after harvest, as above directed in preparing land for barley. If the field be not subject to annuals, it may lie in that state till the end of May; otherwise the weeds must be destroyed by a bracking about the middle of April; and again in May, if weeds rise. The first week of June, plough the field with a shallow furrow. Lime it if requisite, and harrow the lime into the soil. Draw single furrows with intervals of three feet, and lay dung in the furrows. Cover the dung sufficiently, by going round it with the plough, and forming the three-foot spaces into ridges. The dung comes thus to lie below the crown of every ridge.

The season of sowing must be regulated by the time intended for feeding. Where intended for feeding in November, December, January, and February, the seed ought to be sown from the 1st to the 20th of June. Where the feeding is intended to be carried on to March, April, and May, the seed must not be sown till the end of July. Turnip sown earlier than above directed, flowers that very summer, and runs fast to seed; which renders it in a good measure unfit for food. **152**
Season and
method of
sowing.

Practice. food. If sown much later, it does not apple, and there is no food but from the leaves.

Though by a drill-plough the seed may be sown of any thickness, the safest way is to sow thick. Thin sowing is liable to many accidents, which are far from being counterbalanced by the expence that is saved in thinning. Thick-sowing can bear the ravage of the black fly, and leave a sufficient crop behind. It is a protection against drought, gives the plants a rapid progress, and establishes them in the ground before it is necessary to thin them.

The sowing turnip broadcast is universal in England, and common in Scotland, though a barbarous practice. The eminent advantage of turnip is, that beside a profitable crop, it makes a most complete fallow; and the latter cannot be obtained but by horse-hoeing. Upon that account, the sowing turnip in rows at three feet distance is recommended. Wider rows answer no profitable end, straiter rows afford not room for a horse to walk in. When the turnip is about four inches high, annual weeds will appear. Go round every interval with the slightest furrow possible, at the distance of two inches from each row, moving the earth from the rows toward the middle of the interval. A thin plate of iron must be fixed on the left side of the plough, to prevent the earth from falling back and burying the turnip. Next, let women be employed to weed the rows with their fingers; which is better, and cheaper done, than with the hand-hoe. The hand-hoe, beside, is apt to disturb the roots of the turnip that are to stand, and to leave them open to drought by removing the earth from them. The standing turnip are to be at the distance of twelve inches from each other: a greater distance makes them swell too much; a less distance affords them not sufficient room. A woman soon comes to be expert in finger-weeding. The following hint may be necessary to a learner. To secure the turnip that is to stand, let her cover it with the left hand; and with the right pull up the turnip on both sides. After thus freeing the standing turnip, she may safely use both hands. Let the field remain in this state till the appearance of new annuals make a second ploughing necessary; which must be in the same furrow with the former, but a little deeper. As in this ploughing the iron plate is to be removed, part of the loose earth will fall back on the roots of the plants: the rest will fill the middle of the interval, and bury every weed. When weeds begin again to appear, then is the time for a third ploughing in an opposite direction, which lays the earth to the roots of the plants. This ploughing may be about the middle of August; after which, weeds rise very faintly. If they do rise, another ploughing will clear the ground of them. Weeds that at this time rise in the row, may be cleared with a hand-hoe, which can do little mischief among plants distant twelve inches from each other. It is certain, however, that it may be done cheaper with the hand (A). And after the leaves of turnips in a row meet

VOL. I. Part I.

together, the hand is the only instrument that can be applied for weeding. **Practice.**

In swampy ground, the surface of which is best reduced by paring and burning, the seed may be sown in rows with intervals of a foot. To save time, a drill-plough may be used that sows three or four rows at once. Hand-hoeing is proper for such ground; because the foil under the burnt *stratum* is commonly full of roots, which digest and rot better under ground than when brought to the surface by the plough. In the mean time, while these are digesting, the ashes will secure a good crop.

In cultivating turnips to advantage, great care should be taken to procure good, bright, nimble, and well-dried seed, and of the best kinds. **153 Properties of different sorts of turnip.**

The Norfolk farmers generally raise the oval white, the large green-topp'd, and the red or purple-topp'd kinds, which from long experience they have found to be the most profitable.

The roots of the green-topp'd will grow to a large size, and continue good much longer than others. The red or purple-topp'd will also grow large, and continue good to the beginning of February; but the roots become hard and stringy sooner than the former.

The green-topp'd growing more above ground, is in more danger of sustaining injury from severe frosts than the red or purple, which are more than half covered by the foil; but it is the softest and sweetest, when grown large, of any kind. We have seen them brought to table a foot in diameter, and equally good as garden turnips.

Turnips delight in a light foil, consisting of sand and loam mixed; for when the foil is rich and heavy, although the crop may be as great in weight, they will be rank, and run to flower earlier in spring.

Turnip-feed, like that of grain, will not do well without frequent changing. The Norfolk feed is sent to most parts of the kingdom, and even to Ireland, but after two years it degenerates; so that those who wish to have turnips in perfection should procure it fresh every year from Norwich, and they will find their account in so doing. For from its known reputation, many of the London seedsmen sell, under that character, feed raised in the vicinity of the metropolis, which is much inferior in quality. **154 Observations with regard to feed.**

When the plants have got five leaves, they should be hoed, and set out at least six inches apart. A month afterward, or earlier if it be a wet season, a second hoeing should take place, and the plants be left at least 14 inches distant from each other, especially if intended for feeding cattle; for where the plants are left thicker, they will be proportionably smaller, unless the land is very rich indeed.

Some of the best Norfolk farmers sow turnips in drills three feet asunder, and at a second hoeing leave them a foot a part in the rows. By this means the trouble and expence of hoeing is much lessened, and the crop of equal weight as when sown in the common **155 Methods of culture in Norfolk.**

P p

mon

(A) Children under thirteen may be employed to weed turnip with the fingers. We have seen them go on in that work with alacrity; and a small premium will have a good effect. For boys and girls above thirteen, a hand-hoe adapted to their size is an excellent instrument: it strengthens the arms amazingly. In driving the plough, the legs only are exercised; but as the arms are chiefly employed in husbandry, they ought to be prepared beforehand by gentle exercise.

Practice. mon method. The intervals may easily be cleared of weeds by the horse-hoe.

Great quantities of turnips are raised in Norfolk every year for feeding black cattle, which turn to great advantage.

156
Value as
food for
cattle.

It is well known, that an acre of land contains 4840 square yards, or 43,560 square feet; suppose then that every square foot contains one turnip, and that they weigh only two pounds each on an average, here will be a mass of food excellent in kind, of 46 tons per acre, often worth from four to five guineas, and sometimes more.

Extraordinary crops of barley frequently succeed turnips, especially when fed off the land. In feeding them off, the cattle should not be suffered to run over too much of the ground at once, for in that case they will tread down and spoil twice as many as they eat. In Norfolk, they are confined by hurdles to as much as is sufficient for them for one day. By this mode the crop is eaten clean, the soil is equally trodden, which if light, is of much service, and equally manured by the cattle.

A notion prevails in many places, that mutton fattened with turnips is thereby rendered rank and ill-tasted; but this is a vulgar error. The best mutton in Norfolk (and few counties have better) is all fed with turnips. It is rank pastures, and marshy lands, that produce rank mutton.

If the land be wet and springy, the best method is to draw and carry off your turnips to some dry pasture; for the treading of the cattle will not only injure the crop, but render the land so stiff, that you must be at an additional expence in ploughing.

157
Method of
preserving
turnips.

To preserve turnips for late spring feed, the best method, and which has been tried with success by some of the best English farmers, is, To stack them up in dry straw; a load of which is sufficient to preserve 40 tons of turnips. The method is easy, and as follows:—

After drawing your turnips in February, cut off the tops and tap roots, (which may be given to sheep), and let them lay a few days in the field, as no weather will then hurt them.

Then, on a layer of straw next the ground, place a layer of turnips two feet thick; and then another layer of straw, and so on alternately, till you have brought the heap to a point. Care must be taken to turn up the edges of the layers of straw, to prevent the turnips from rolling out; cover the top well with long straw, and it will serve as a thatch for the whole.

In this method, as the straw imbibes the moisture exhaled from the roots, all vegetation will be prevented, and the turnips will be nearly as good in May as when first drawn from the field. If straw be scarce, old haulm or stubble will answer the same purpose.

But to prevent this trouble and expence, perhaps farmers in all counties would find it most to their interest to adopt the method used by our neighbours the Norfolk farmers, which is, to continue sowing turnips to the latter end of August; by which means their late crops remain good in the field till the latter end of April, and often till the middle of May.

The advantages of having turnips good till the spring feed is generally ready, are so obvious and so great, that many of the most intelligent farmers (although at

first prejudiced against the practice) are now come into it, and find their account in so doing. **Practice.**

2. POTATOES.

The choice of soil is not of greater importance in any other plant than in a potato. This plant in clay soil, or in rank black loam lying low without ventilation, never makes palatable food. In a gravelly or sandy soil, exposed to the sun and to free air, it thrives to perfection, and has a good relish. But a rank black loam, though improper to raise potatoes for the table, produces them in great plenty; and the product is, as already observed, a palatable food for horned cattle, hogs, and poultry.

158
General
culture.

The spade is a proper instrument for raising a small quantity, or for preparing corners or other places inaccessible to the plough; but for raising potatoes in quantities, the plough is the only instrument.

As two great advantages of a drilled crop are, to destroy weeds, and to have a fallow at the same time with the crop, no judicious farmer will think of raising potatoes in any other way. In September or October, as soon as that year's crop is removed, let the field have a rousing furrow, a cross-brakeing next, and then be cleared of weeds by the cleaning harrow. Form it into three-feet ridges, in that state to lie till April, which is the proper time for planting potatoes. Cross-bake it, to raise the furrows a little. Then lay well-digested horse-dung along the furrows, upon which lay the roots at eight inches distance. Cover up these roots with the plough, going once round every row. This makes a warm bed for the potatoes; hot dung below, and a loose covering above, that admits every ray of the sun. As soon as the plants appear above ground, go round every row a second time with the plough, which will lay upon the plants an additional inch or two of mould, and at the same time bury all the annuals; and this will complete the ploughing of the ridges. When the potatoes are six inches high, the plough, with the deepest furrow, must go twice along the middle of each interval in opposite directions, laying earth first to one row, and next to the other. And to perform this work, a plough with a double mould-board will be more expeditious. But as the earth cannot be laid close to the roots by the plough, the spade must succeed, with which four inches of the plants must be covered, leaving little more but the tops above ground; and this operation will at the same time bury all the weeds that have sprung since the former ploughing. What weeds arise after must be pulled up with the hand. A hoe is never to be used here: it cannot go so deep as to destroy the weeds without cutting the fibres of the plants; and if it skim the surface, it only cuts off the heads of the weeds, and does not prevent their pushing again.

In the Bath Society-Papers, we have the following practical observations on the culture and use of potatoes, given as the result of various experiments made for five years successively on that valuable root, the growth of which cannot be too much encouraged. **Particular methods.**

When the potato crop has been the only object in view, the following method is the most eligible.

The land being well pulverized by two or three good harrowings and ploughings, is then manured with 15 or 20 cart-loads of dung per acre, before it receives its last

Practice. last earth. Then it is thrown on to what the Suffolk farmers call the *Trench balk*, which is narrow and deep ridge-work, about 15 inches from the centre of one ridge to the centre of the other. Women and children drop the sets in the bottom of every furrow 15 inches apart; men follow, and cover them with large hoes, a foot in width, pulling the mould down so as to bury the sets five inches deep; they must receive two or three hand-hoings, and be kept free from weeds; always observing to draw the earth as much as possible to the stems of the young plants. By repeated trials, the first or second week in April is found the most advantageous time for planting.

In the end of September or the beginning of October, when the haulm becomes withered, they should be ploughed up with a strong double-breasted plough. The workman must be cautioned to set his plough very deep, that he may strike below all the potatoes, to avoid damaging the crop. The women who pick them up, if not carefully attended to, will leave many in the ground, which will prove detrimental to any succeeding corn, whether wheat or barley. To avoid which inconvenience, let the land be harrowed, and turn the swine in to glean the few that may be left by their negligence.

By this method, the sets will be 15 square inches from each other; it will take 18 bushels to plant an acre; and the produce, if on a good mixed loamy soil, will amount to 300 bushels.

If the potatoes are grown as a preparation for wheat, it is preferable to have the rows two feet two inches from each other, hand-hoeing only the space from plant to plant in each row; then turning a small furrow from the inside of each row by a common light plough, and afterwards with a double-breasted plough with one horse, split the ridge formed by the first ploughing thoroughly to clean the intervals. This work should not be done too deep the first time, to avoid burying the tender plants; but the last earth should be ploughed as deep as possible; and the clover the mould is thrown to the stems of the plants, the more advantageous it will prove. Thus 15 bushels will plant an acre, and the produce will be about 300 bushels; but the land, by the summer ploughings, will be prepared to receive seed-wheat immediately, and almost ensure a plentiful crop.

¹⁶⁰
To prevent the grub. The potato-sets should be cut a week before planting, with one or two eyes to each, and the pieces not very small; two bushels of fresh slaked lime should be sown over the surface of the land as soon as planted, which will effectually prevent the attacks of the grub.

The expence attending an acre of potatoes well cultivated in the first method, supposing the rent 20 shillings, tithes and town charges rather high (as in Suffolk), taking up, and every thing included, will be about six pounds. In the last method, it would be somewhat reduced.

“When predilections for old customs are subdued (adds the author), I hope to see the potato admitted in the constant course of crops by every spirited husbandman. The most beneficial effects will, I am certain, accrue from such a system. The advantages in my neighbourhood are apparent; I cultivated and fed my own children upon them, and my poorer neighbours sensibly followed the example. A great proportion of

Practice. every cottager’s garden is now occupied by this root, and it forms a principal part of their diet. Potatoes are cheap and excellent substitutes for peas in soups and broths, allowing double the quantity.

“Although it is nearly a transcript of the directions given by a very ingenious author, yet I shall take the liberty of inserting a receipt for making a potato-soup, which I have weekly distributed amongst the poor to their great relief.

	s.	d.
An ox’s head	2	9
Two pecks of potatoes	0	6
Quarter of a peck of onions	0	3
Three quarters of a pound of salt	0	1
An ounce and a half of pepper	0	3
Total	3	10

Ninety pints of water to be boiled with the above ingredients on a slow fire until reduced to 60, which require one peck of coals, value threepence. I have added the expence of every article according to their prices with me, that gentlemen may nearly perceive at how easy a rate they can feed 60 of their poor neighbours. I find from experience, a pint of this soup, with a small piece of the meat, is sufficient to satisfy a hearty working man with a good meal. If vegetables are plentiful, some of every sort may be added, with a few sweet herbs.

“I hope my inserting the above, will not be esteemed improper; though somewhat deviating from the culture of potatoes, it may possibly be a means of rendering them more extensively useful.”

A premium having been offered by the abovementioned Society for the cultivation of potatoes by farmers, &c. whose rent does not exceed 40l. per annum, the following methods were communicated, by which those who have only a small spot of ground may obtain a plentiful crop.

¹⁶²
Methods of cultivating potatoes on small spots. First, then, the earth should be dug 12 inches deep, if the soil will allow of it; after this, a hole should be opened about six inches deep, horse-dung, or long litter should be put therein about three inches thick; this hole should not be more than 12 inches in diameter; upon this dung or litter, a potato should be planted whole, upon which a little more dung should be shook, and then earth must be put thereon. In like manner the whole plot of ground must be planted, taking care that each potato be at least 16 inches apart; and when the young shoots make their appearance, they should have fresh mould drawn round them with a hoe; and if the tender shoots are covered, it will prevent the frost from injuring them: they should again be earthed when the shoots make a second appearance, but not be covered, as in all probability the season will then be less severe. A plentiful supply of mould should be given them, and the person who performs this business should never tread upon the plant, or the hillock that is raised round it; as the lighter the earth is, the more room the potato will have to expand. From a single root thus planted, very near 40 pounds weight of large potatoes were obtained, and from almost every other root upon the same plot of ground from 15 to 20 pounds weight; and except the soil be stoney or gravelly, 10 pounds or half a peck of potatoes may almost always be obtained from each root, by pursuing the

Practice. the foregoing method. But note, cuttings or small sets will not do for this purpose.

¹⁶³
Methods
of culture
adapted to
small farms.

The second method will suit the indolent, or those who have not time to dig their ground, and that is, where weeds much abound and have not been cleared in the winter, a trench may be opened in a straight line the whole length of the ground, and about six inches deep; in this trench the potatoes should be planted about 10 inches apart; cuttings or small potatoes will do for this method. When they are laid in the trench, the weeds that are on the surface may be pared off on each side about 10 inches from it, and be turned upon the plants; another trench should then be dug, and the mould that comes out of it turned carefully on the weeds. It must not be forgot, that each trench should be regularly dug, that the potatoes may be throughout the plot 10 or 12 inches from each other. This slovenly method will in general raise more potatoes than can be produced by digging the ground twice, and dibbling in the plants; and the reason is, that the weeds lighten the soil, and give the roots room to expand. They should be twice hoed, and earthed up in rows. And here note, that if cut potatoes are to be planted, every cutting should have two eyes, for though fewer sets will be obtained, there will be a greater certainty of a crop, as one eye often fails or is destroyed by grubs in the earth.

Where a crop of potatoes fail in part (as will sometimes be the case in a dry season), amends may still be made by laying a little dung upon the knots of the straw or haulm of those potatoes that do appear, and covering them with mould; each knot or joint thus ordered will, if the weather prove wet afterwards, produce more potatoes than the original roots.

From the smallest potatoes planted whole, from four to six pounds at a root were obtained, and some of the single potatoes weighed near two pounds. These were dug in as before-mentioned, in trenches where the ground was covered with weeds, and the soil was a stiff loamy clay.

A good crop may be obtained by laying potatoes upon turf at about 12 or 14 inches apart, and upon beds of about six feet wide; on each side of which a trench should be opened about three feet wide, and the turf that comes from thence should be laid with the grassy side downwards upon the potatoes; a spit of mould should next be taken from the trenches, and be spread over the turf; and in like manner the whole plot of ground that is designed to be planted must be treated. And remark, that when the young shoots appear, another spit of mould from the trenches should be strewed over the beds so as to cover the shoots; this will prevent the frost from injuring them, encourage them to expand, and totally destroy the young weeds; and when the potatoes are taken up in the autumn, a careful person may turn the earth again into the trenches, so as to make the surface level; and it will be right to remark, that from the same ground a much better crop of potatoes may be obtained the following year.

For field planting, a good (if not the best) method is to dung the land, which should be once ploughed previous thereto; and when it is ploughed a second time, a careful person should drop the potato plants before the plough in every third furrow at about eight or

ten inches apart. Plants that are cut with two eyes are best for this purpose. The reason for planting them at so great a distance as every third furrow, is, that when the shoots appear, a horse-hoe may go upon the two vacant furrows to keep them clean; and after they are thus hoed, they should be moulded up in ridges; and if this crop be taken up about October or November, the land will be in excellent condition to receive a crop of wheat. Lands that are full of twitch or couch-grass may be made clean by this method, as the horse-hoeing is as good as a summer-fallow; and if, when the potatoes are taken up, women and children were to pick out such filth, not any traces of it would remain; and by laying it on heaps and burning it, a quantity of ashes would be produced for manure.

After ploughing, none should ever dibble in potatoes, as the persons who dibble, plant, or hoe them, will all tread the ground; by which means it will become so bound, that the young fibres cannot expand, as has been already observed. Good crops have indeed been obtained by ploughing the land twice, and dropping the plants in every other furrow, and by hand-hoeing and earthing them up afterwards as the gardeners do pease; but this method is not equal to the other.

Vacant places in hedge-rows might be grubbed and planted with potatoes, and a good crop might be expected, as the leaves of trees, thorns, &c. are a good manure, and will surprisngly encourage their growth, and gratify the wishes of the planter; who by cultivating such places, will then make the most of his ground, and it will be in fine order to receive a crop of corn the following year.

Account of the culture, expences, and produce of six acres of potatoes, being a fair part of near 70 acres, raised by John Billington, Esq; and for which the premium was granted him in the year 1784.

The field on which the above experiment was made, was an oat-stubble in the autumn of 1783. In October it was ploughed, and left in a rough state during the winter. In April it was cross-ploughed and harrowed. On the 8th of May the field was marked out into beds or ridges eight feet wide, leaving a space of two feet wide for an alley between every two ridges. The manure (a compost of stable dung, virgin earth, and scrapings of a turnpike road) was then brought on the land, and deposited in small heaps on the centre of each ridge, in the proportion of about 30 cart-loads to each acre. A trench was then opened with a spade, breadth-way of the ridge, about four inches deep; in this trench the potato-sets were placed, at the distance of nine inches from each other; the dung was then spread in a trench on the sets, and a space or slit of 14 inches in breadth, dug in upon them. When the plants were about six inches high, they were carefully hoed, and soon after the two feet intervals between the ridges were dug, and the contents thrown around the young plants. This refreshment, added to the ample manuring previously bestowed, produced such a luxuriance and rapidity of growth, that no weed could show its head.

165
Best method of raising them up.

The shortest and most certain method of taking up potatoes, is to plough once round every row at the distance of four inches, removing the earth from the plants, and gathering up with the hand all the potatoes that appear. The distance is made four inches, to prevent cutting the roots, which are seldom found above that distance from the row on each side. When the ground is thus cleared by the plough, raise the potatoes with a fork having three broad toes or claws; which is better than a spade, as it does not cut the potatoes. The potatoes thus laid above ground must be gathered with the hand. By this method scarce a potato will be left.

166
Of preferring them.

As potatoes are a comfortable food for the low people, it is of importance to have them all the year round. For a long time, potatoes in Scotland were confined to the kitchen-garden; and after they were planted in the field, it was not imagined at first that they could be used after the month of December. Of late years, they have been found to answer even till April; which has proved a great support to many a poor family, as they are easily cooked, and require neither kiln nor mill. But there is no cause for stopping there. It is easy to preserve them till the next crop: When taken out of the ground, lay in the corner of a barn a quantity that may serve till April, covered from frost with dry straw pressed down: bury the remainder in a hole dug in dry ground, mixed with the husks of dried oats, sand, or the dry leaves of trees, over which build a stack of hay or corn. When the pit is opened for taking out the potatoes, the eyes of what have a tendency to push must be cut out; and this cargo will serve all the month of June. To be still more certain of making the old crop meet the new, the setting of a small quantity may be delayed till June, to be taken

up at the ordinary time before frost. This cargo, having not arrived to full growth, will not be so ready to push as what are set in April.

Practice.

If the old crop happen to be exhausted before the new crop is ready, the interval may be supplied by the potatoes of the new crop that lie next the surface, to be picked up with the hand; which, far from hurting the crop, will rather improve it.

3. CARROT and PARSNIP.

OF all roots, a carrot requires the deepest soil. It ought at least to be a foot deep, all equally good from top to bottom. If such a soil be not in the farm, it may be made artificially by trench-ploughing, which brings to the surface what never had any communication with the sun or air. When this new soil is sufficiently improved by a crop or two with dung, it is fit for bearing carrots. Beware of dunging the year when the carrots are sown; for with fresh dung they seldom escape rotten scabs.

167

The only soils proper for that root, are a loam and a sandy soil.

The ground must be prepared by the deepest furrow that can be taken, the sooner after harvest the better; immediately upon the back of which, a ribbing ought to succeed, as directed for barley. At the end of March, or beginning of April, which is the time of sowing the seed, the ground must be smoothed with a brake. Sow the seed in drills, with intervals of a foot for hand-hoeing: which is no expensive operation where the crop is confined to an acre or two: but if the quantity of ground be greater, the intervals ought to be three feet, in order for horse-hoeing.

In flat ground without ridges, it may be proper to make parallel furrows with the plough, ten feet from each other, in order to carry off any redundant moisture.

At Parlington in Yorkshire, from the end of September to the first of May, 20 work-horses, four bullocks, and six milk-cows, were fed on the carrots that grew on three acres; and these animals never tasted any other food but a little hay. The milk was excellent: and, over and above, 30 hogs were fattened upon what was left by the other beasts. We have this fact from undoubted authority.

168

The culture of parsnips is the same with that of carrots.

III. Plants cultivated for Leaves, or for both Leaves and Root.

THERE are many garden-plants of these kinds. The plants proper for the field are cabbage red and white, colewort plain and curled, turnip-rooted cabbage, and the root of scarcity.

1. Cabbage is an interesting article in husbandry. It is easily raised, is subject to few diseases, resists frost more than turnip, is palatable to cattle, and sooner fills than turnip, carrot, or potatoes.

169

The season for setting cabbage depends on the use it is intended for. If intended for feeding in November, December, and January, plants procured from seed sown the end of July the preceding year must be set in March or April. If intended for feeding in March, April, and May, the plants must be set the first week.

Culture of cabbage.

Practice. week of the preceding July, from seed sown in the end of February or beginning of March the same year. The late setting of the plants retards their growth; by which means they have a vigorous growth the following spring. And this crop makes an important link in the chain that connects winter and summer green food. Where cabbage for spring-food happens to be neglected, a few acres of rye, sown at Michaelmas, will supply the want. After the rye is consumed, there is time sufficient to prepare the ground for turnip.

And now to prepare a field for cabbage. Where the plants are to be set in March, the field must be made up after harvest, in ridges three feet wide. In that form let it lie all winter, to be mellowed with air and frost. In March, take the first opportunity, between wet and dry, to lay dung in the furrows. Cover the dung with a plough, which will convert the furrow into a crown, and consequently the crown into a furrow. Set the plants upon the dung, distant from each other three feet. Plant them so as to make a straight line cross the ridges, as well as along the furrows, to which a gardener's line stretched perpendicularly cross the furrows will be requisite. This will set each plant at the distance precisely of three feet from the plants that surround it. The purpose of this accuracy is to give opportunity for ploughing, not only along the ridges, but cross them. This mode is attended with three signal advantages: it saves hand-hoeing, it is a more complete dressing to the soil, and it lays earth neatly round every plant.

If the soil be deep and composed of good earth, a trench-ploughing after the preceding crop will not be amiss; in which case, the time for dividing the field into three-foot ridges, as above, ought to be immediately before the dunging for the plants.

If weeds happen to rise so close to the plants as not to be reached by the plough, it will require very little labour to destroy them with a hand-hoe.

Unless the soil be much infested with annuals, twice ploughing after the plants are set will be a sufficient dressing. The first removes the earth from the plants; the next, at the distance of a month or so, lays it back.

Where the plants are to be set in July, the field must be ribbed as directed for barley. It ought to have a slight ploughing in June before the planting, in order to loosen the soil, but not so as to bury the surface-earth; after which the three feet ridges must be formed, and the other particulars carried on as directed above with respect to plants that are to be set in March.

170
Cultivation
of the turnip-rooted
cabbages.

2. As to the *turnip-rooted cabbages*, their importance and value seem only to have been lately ascertained. In the Bath Society Papers we have the following account of Sir Thomas Beevor's method of cultivating them; which from experience he found to be cheaper and better than any other.

"In the first or second week of June, I sow the same quantity of seed, hoe the plants at the same size, leave them at the same distance from each other, and treat them in all respects like the common turnip. In this method I have always obtained a plentiful crop of them; to ascertain the value of which I need only inform you, that on the 23d day of April last, having then two acres left of my crop, sound, and in great

perfection, I divided them by fold hurdles into three parts of nearly equal dimensions. Into the first part I put 24 small bullocks of about 30 stone weight each (14 lb. to the stone), and 30 middle-sized fat wethers, which, at the end of the first week, after they had eaten down the greater part of the leaves, and some part of the roots, I shifted into the second division, and then put 70 lean sheep into what was left of the first; these fed off the remainder of the turnips left by the fat stock; and so they were shifted through the three divisions, the lean stock following the fat as they wanted food, until the whole was consumed.

"The 24 bullocks and 30 fat wethers continued in the turnips until the 21st of May, being exactly four weeks; and the 70 lean sheep until the 29th, which is one day over four weeks: so that the two acres kept me 24 small bullocks and 110 sheep four weeks (not reckoning the overplus day of keeping the lean sheep); the value, at the rate of keeping at that season, cannot be estimated in any common year at less than 4 d. a-week for each sheep, and 1 s. 6d. per week for each bullock, which would amount together to the sum of L. 14 : 10 : 8 for the two acres.

"You will hardly, I conceive, think I have set the price of keeping the stock at too high a rate; it is beneath the price here in almost every spring, and in this last it would have cost double, could it have been procured; which was so far from being the case, that hundreds of sheep and lambs here were lost, and the rest greatly pinched for want of food.

"You will observe, gentlemen, that in the valuation of the crop above mentioned I have claimed no allowance for the great benefit the farmer receives by being enabled to suffer his grass to get into a forward growth, nor for the superior quality of these turnips in fattening his stock; both which circumstances must stamp a new and a great additional value upon them. But as their continuance on the land may seem to be injurious to the succeeding crop, and indeed will deprive the farmer totally of either oats or barley; so to supply that loss I have always sown buck-wheat on the first earth upon the land from which the turnips were thus fed off; allowing one bushel of seed per acre, for which I commonly receive from five to six quarters per acre in return. And that I may not throw that part of my land out of the same course of tillage with the rest, I sow my clover or other grass-seeds with the buck-wheat, in the same manner as with the oat or barley crops, and have always found as good a *layer* (ley) of it afterwards.

"Thus you see, that in providing a most incomparable vegetable food for cattle, in that season of the year in which the farmer is generally most distressed, and his cattle almost starved, a considerable profit may likewise be obtained, much beyond what is usually derived from his former practice, by the great produce and price of a crop raised at so easy an expence as that of buck-wheat, which, with us, sells commonly at the same price as barley, oftentimes more, and but very rarely for less.

"The land on which I have usually sown turnip-rooted cabbages is a drymixed soil, worth 15 s. per acre."

To the preceding account the Society have subjoined the following note: "Whether we regard the im-
portance

Practice.
171
Their utility
and value.

Practice. portance of the subject, or the clear and practical information which the foregoing letter conveys, it may be considered as truly interesting as any we have ever been favoured with : and therefore it is recommended in the strongest manner to farmers in general, that they adopt a mode of practice so decisively ascertained to be in a high degree judicious and profitable.”

172
Recommendation by the Bath Society.

To raise the turnip-rooted cabbage for transplanting, the best method yet discovered is, to break-plough and burn as much old pasture as may be judged necessary for the seed-bed ; two perch well stocked with plants will be sufficient to plant an acre. The land should be dug as shallow as possible, turning the ashes in ; and the seed should be sown the beginning of April.

173
To raise the turnip-rooted cabbage for transplanting.

The land intended for the plantation to be cultivated and dunged as for the common turnip. About Midsummer (or sooner if the weather will permit) will be a proper time for planting, which is best done in the following manner : the land to be thrown into *one-bout* ridges, upon the tops of which the plants are to be set, at about 18 inches distance from each other. As soon as the weeds rise, give a hand-hoeing, afterwards run the ploughs in the intervals, and fetch a furrow from each ridge, which, after laying a fortnight or three weeks, is again thrown back to the ridges ; if the weeds rise again, it is necessary to give them another hand-hoeing.

If the young plants in the feed-bed should be attacked by the fly, sow wood-ashes over them when the dew is on, which will effectually prevent the ravages they would otherwise make.

174
Culture of the root of scarcity.

3. The *racinode difette*, or root of scarcity, (*Betaciela*) delights in a rich loamy land well dunged. It is directed to be sown in rows, or broad-cast, and as soon as the plants are of the size of a goose-quill, to be transplanted in rows of 18 inches distance, and 18 inches a part, one plant from the other : care must be taken in the sowing, to sow very thin, and to cover the seed, which lays in the ground about a month, an inch only.—In transplanting, the root is not to be shortened, but the leaves cut at the top ; the plant is then to be planted with a setting-stick, so that the upper part of the root shall appear about half an inch out of the ground ; this last precaution is very necessary to be attended to. These plants will strike root in twenty-four hours, and a man a little accustomed to planting, will plant with ease 1800 or 2000 a-day. In the feed-bed, the plants, like all others, must be kept clear of weeds : when they are planted out, after once hoeing, they will take care of themselves, and suffocate every kind of weed near them.

The best time to sow the seed is from the beginning of March to the middle of April : it is, however, advised to continue sowing every month until the beginning of July, in order to have a succession of plants. Both leaves and roots have been extolled as excellent both for man and beast. This plant is said not to be liable, like the turnip, to be destroyed by insects, for no insect touches it, nor is it affected by excessive drought, or the changes of seasons. Horned cattle, horses, pigs, and poultry, are exceedingly fond of it when cut small. The leaves may be gathered every 12 or 15 days ; they are from 30 to 40 inches long, by 22 to 25 inches broad. This plant is excellent for milch cows, when given to them in proper proportions,

as it adds much to the quality as well as quantity of their milk ; but care must be taken to proportion the leaves with other green food, otherwise it would abate the milk, and fatten them too much, it being of so exceeding a fattening quality. To put all these properties beyond doubt, however, further experiments are wanting.

Practice.

SECT. IV. Culture of Grasses.

THE latter end of August, or the beginning of September, is the best season for sowing grass-seeds, as there is time for the roots of the young plants to fix themselves before the sharp frosts set in. It is scarce necessary to say, that moist weather is best for sowing ; the earth being then warm, the seeds will vegetate immediately ; but if this season prove unfavourable, they will do very well the middle of March following.

175
Of laying down fields to grass.

If you would have fine pasture, never sow on foul land. On the contrary, plough it well, and clear it from the roots of couch-grass, rest harrow, fern, broom, and all other noxious weeds. If these are suffered to remain, they will soon get above, and destroy your young grasses. Rake these up in heaps, and burn them on the land, and spread the ashes as a manure. These ploughings and harrowings should be repeated in dry weather. And if the soil be clayey and wet, make some under-drains to carry off the water, which, if suffered to remain, will not only chill the grass, but make it four. Before sowing, lay the land as level and fine as possible. If your grass-seeds are clean, (which should always be the case) three bushels will be sufficient per acre. When sown, harrow it in gently, and roll it in with a wooden roller. When it comes up, fill up all the bare spots by fresh seed, which, if rolled to fix it, will soon come up, and overtake the rest.

In Norfolk they sow clover with their grasses, particularly with rye-grass ; but this should not be done except when the land is designed for grass only three or four years, because neither of these kinds will last long in the land. Where you intend it for a continuance, it is better to mix only small white Dutch clover, or marle grass, with your other grasses seed, and not more than eight pounds to an acre. These are abiding plants, spread close on the surface, and make the sweetest feed of any for cattle. In the following spring, root up thistles, hemlock, or any large plants that appear. The doing this while the ground is soft enough to permit your drawing them by the roots, and before they feed, will save you infinite trouble afterwards.

The common method of proceeding in laying down fields to grass is extremely injudicious. Some sow barley with their grasses, which they suppose to be useful in shading them, without considering how much the corn draws away the nourishment from the land.

Others take their seeds from a foul hay-rick ; by which means, besides filling the land with rubbish and weeds, what they intend for dry soils may have come from moist, where it grew naturally, and *vice versa*. The consequence is, that the ground, instead of being covered with a good thick sward, is filled with plants unnatural to it. The kinds of grasses most eligible for pasture-lands are, the annual-meadow, creeping, and fine bent, the fox-tails, and crested dog's-tail, the poas, the fescues, the vernal, oat-grass,

176
Different kinds of grasses.

Practice.

grafs, and the ray, or rye-grafs. We do not, however, approve of fowing all thefe kinds together; for not to mention their ripening at different times, by which means you can never cut them all in perfection and full vigour, no kind of cattle are fond of all alike.

Horfes will fcarcely eat hay which oxen and cows will thrive upon; fheep are particularly fond of fome kinds, and refufe others. The Darnel-grafs, if not cut before feveral of the other kinds are ripe, becomes fo hard and wiry in the ftalks, that few cattle care to eat it.

Such gentlemen as with a particular account of the above-mentioned graffes, will be amply gratified in confulting Mr Stillingfleet on this fubject. He has treated it with great judgment and accuracy, and thofe who follow his directions in the choice of their graffes will be under no fmall obligation to him for the valuable information he has given them. The fubftance of his obfervations are given in the article GRASSES in this Dictionary.

The graffes commonly fown for pafture, for hay, or to cut green for cattle, are red clover, white clover, yellow clover, rye-grafs, narrow-leaved plaintain commonly called *ribwort*, faintfoin, and lucerne.

Red clover is of all the moft proper to be cut green for fummer-food. It is a biennial plant when fuffered to perfect its feed; but when cut green, it will laft three years, and in a dry foil longer. At the fame time the fafeft courfe is to let it ftand but a fingle year: if the fecond year's crop happen to be fcanty, it proves, like a bad crop of peafe, a great encourager of weeds by the fhelter it affords them.

Here, as in all other crops, the goodnefs of feed is of importance. Chooſe plump feed of a purple colour, becaufe it takes on that colour when ripe. It is red when hurt in the drying, and of a faint colour when unripe.

177
Of red clo
ver.

Red clover is luxuriant upon a rich foil, whether clay, loam, or gravel: it will grow even upon a moor, when properly cultivated. A wet foil is its only bane; for there it does not thrive.

To have red clover in perfection, weeds muft be extirpated, and ftones taken off. The mould ought to be made as fine as harrowing can make it; and the furface be fmoothed with a light roller, if not fufficiently fmooth without it. This gives opportunity for diftributing the feed evenly: which muft be covered by a fmall harrow with teeth no larger than that of a garden-rake, three inches long, and fix inches afunder*. In harrowing, the man ſhould walk behind with a rope in his hand fixed to the back part of the harrow, ready to difentangle it from ftones, clods, turnip or cabbage-roots, which would trail the feed, and difplace it.

* Plate V.
fig. 7.

Nature has not determined any precise depth for the feed of red clover more than of other feed. It will grow vigorously from two inches deep, and it will grow when barely covered. Half an inch may be reckoned the moft advantageous pofition in clay foil, a whole inch in what is light or loofe. It is a vulgar error, that fmall feed ought to be fparingly covered. Mifled by that error, farmers commonly cover their clover-feed with a bufhy branch of thorn; which not only covers it unequally, but leaves part on the furface to wither in the air.

The proper feafon for fowing red-clover, is from the N^o 8.

Practice. middle of April to the middle of May. It will fpring from the firft of March to the end of Auguft; but fuch liberty ought not to be taken except from neceffity.

Practice.

There cannot be a greater blunder in husbandry, than to be fparing of feed. Ideal writers talk of fowing an acre with four pounds. That quantity of feed, fay they, will fill an acre with plants as thick as they ought to ftand. This rule may be admitted where grain is the object; but it will not answer with refpect to grafs. Grafs-feed cannot be fown too thick: the plants fhelter one another: they retain all the dew: and they muft push upward, having no room laterally. Obferve the place where a fack of peafe, or of other grain, has been fet down for fowing: the feed dropt there accidentally grows more quickly than in the reft of the field fown thin out of hand. A young plant of clover, or of faintfoin, according to Tull, may be raifed to a great fize where it has room; but the field will not produce half the quantity. When red clover is fown for cutting green, there ought not to be lefs than 24 pounds to an acre. A field of clover is feldom too thick: the fmall a ftem be, the more acceptable it is to cattle. It is often too thin; and when fo, the ftems tend to wood.

Red clover is commonly fown with grain; and the moft proper grain has been found by experience to be flax. The foil muft be highly cultivated for flax as well as for red clover. The proper feafon of fowing is the fame for both; the leaves of flax being very fmall, admit of free circulation of air; and flax being an early crop, is removed fo early as to give the clover time for growing. In a rich foil it has grown fo faft, as to afford a good cutting that very year. Next to flax, barley is the beft companion to clover. The foil muft be loofe and free for barley; and fo it ought to be for clover: the feafon of fowing is the fame; and the clover is well eftablifhed in the ground, before it is over-topped by the barley. At the fame time, barley commonly is fooner cut than either oats or wheat. In a word, barley is rather a nurfe than a ftepmother to clover during its infancy. When clover is fown in fpring upon wheat, the foil, which has lain five or fix months without being ftirred, is an improper bed for it; and the wheat, being in the vigour of growth, overtops it from the beginning. It cannot be fown along with oats, becaufe of the hazard of froft; and when fown as ufual among the oats three inches high, it is over-topped, and never enjoys free air till the oats be cut. Add, that where oats are fown upon the winter-furrow, the foil is rendered as hard as when under wheat.—Red clover is fometimes fown by itfelf without other grain: but this method, befide lofing a crop, is not falutary; becaufe clover in its infant ftate requires fhelter.

As to the quantity of grain proper to be fown with clover: In a rich foil well pulverized, a peck of barley on an Englifh acre is all that ought to be ventured; but there is not much foil in Scotland fo rich. Two Linlithgow firlots make the proper quantity for an acre that produces commonly fix bolls of barley; half a firlot for what produces nine bolls. To thofe who are governed by cuftom, fo fmall a quantity will be thought ridiculous. Let them only confider, that a rich foil in perfect good order, will from a fingle feed

of

Practice.

of barley produce 20 or 30 vigorous stems. People may flatter themselves with the remedy of cutting barley green for food, if it happen to oppress the clover. This is an excellent remedy in a field of an acre or two; but the cutting an extensive field for food must be slow; and while one part is cutting, the clover is smothered in other parts.

179

White and yellow clover, ribwort, and rye-grafs.

The culture of white clover, of yellow clover, of ribwort, of rye-grafs, is the same in general with that of red clover. We proceed to their peculiarities. Yellow clover, ribwort, rye-grafs, are all of them early plants, blooming in the end of April or beginning of May. The two latter are evergreens, and therefore excellent for winter-pasture. Rye-grafs is less hurt by frost than any of the clovers, and will thrive in a moister soil: nor in that soil is it much affected by drought. In a rich soil, it grows four feet high: even in the dry summer 1775, it rose to three feet eight inches; but it had gained that height before the drought came on. These grasses are generally sown with red clover for producing a plentiful crop. The proportion of seed is arbitrary; and there is little danger of too much. When rye-grafs is sown for procuring feed, five shilots wheat-measure may be sown on an acre; and for procuring seed of ribwort, 40 pounds may be sown. The roots of rye-grafs spread horizontally: they bind the soil by their number; and tho' small, are yet so vigorous as to thrive in hard soil. Red clover has a large tap-root, which cannot penetrate any soil but what is open and free; and the largeness of the root makes the soil still more open and free. Rye-grafs, once a great favourite, appears to be discarded in most parts of Britain. The common practice has been, to sow it with red clover, and to cut them promiscuously the beginning of June for green food, and a little later for hay. This indeed is the proper season for cutting red clover, because at that time it begins to flower; but as at that time the seed of the rye-grafs is approaching to maturity, its growth is stopped for that year, as much as of oats or barley cut after the seed is ripe. Oats or barley cut green before the seed forms, will afford two other cuttings; which is the case of rye-grafs, of yellow clover, and of ribwort. By such management, all the profit will be drawn that these plants can afford.

When red clover is intended for seed, the ground ought to be cleared of weeds, were it for no other purpose than that the seed cannot otherwise be preserved pure: what seeds escape the plough ought to be taken out by the hand. In England, when a crop of seed is intended, the clover is always first cut for hay. This appears to be done, as in fruit-trees, to check the growth of the wood, in order to encourage the fruit. This practice will not answer in Scotland, as the seed would often be too late for ripening. It would do better to eat the clover with sheep till the middle of May, which would allow the seed to ripen. The seed is ripe when, upon rubbing it between the hands, it parts readily from the husk. Then apply the scythe, spread the crop thin, and turn it carefully. When perfectly dry, take the first opportunity of a hot day for threshing it on boards covered with a coarse sheet. Another way less subject to risk, is to stack the dry hay, and to thresh it in the end of April. After the first threshing, expose the husks to the sun, and thresh them over and over till no seed remain. Nothing is more efficacious

than a hot sun to make the husk part with its seed; in which view it may be exposed to the sun by parcels, an hour or two before the flail is applied.

White clover, intended for feed, is managed in the same manner. No plant ought to be mixed with rye-grafs that is intended for feed. In Scotland, much rye-grafs seed is hurt by transgressing that rule. The seed is ripe when it parts easily with the husk. The yellowness of the stem is another indication of its ripeness; in which particular it resembles oats, barley, and other culmiferous plants. The best manner to manage a crop of rye-grafs for seed, is to bind it loosely in small sheaves, widening them at the bottom to make them stand erect; as is done with oats in moist weather. In that state they may stand till sufficiently dry for threshing. By this method they dry more quickly, and are less hurt by rain, than by close binding and putting the sheaves in shocks like corn. The worst way of all is to spread the rye-grafs on the moist ground, for it makes the seed malten. The sheaves, when sufficiently dry, are carried into close carts to where they are to be threshed on a board, as mentioned above for clover. Put the straw in a rick when a hundred stone or so are threshed. Carry the threshing-board to the place where another rick is intended; and so on till the whole seed be threshed, and the straw ricked. There is necessity for close carts to save the seed, which is apt to drop out in a hot sun; and, as observed above, a hot sun ought always to be chosen for threshing. Carry the feed in sacks to the granary or barn, there to be separated from the husks by a fanner. Spread the feed thin upon a timber-floor, and turn it once or twice a day till perfectly dry. If suffered to take a heat, it is useless for seed.

Practice.

The writers on agriculture reckon sainfoin preferable to clover in many respects: They say, that it produces a larger crop; that it does not hurt cattle when eaten green; that it makes better hay; that it continues four times longer in the ground; and that it will grow on land that will bear no other crop.

Sainfoin has a very long tap-root, which is able to pierce very hard earth. The roots grow very large; and the larger they are, they penetrate to the greater depth; and hence it may be concluded, that this grass, when it thrives well, receives a great part of its nourishment from below the *staple* of the soil: of course, a deep dry soil is best for the culture of sainfoin. When plants draw their nourishment from that part of the soil that is near the surface, it is not of much consequence whether their number be great or small. But the case is very different when the plants receive their food, not only near, but also deep below, the surface. Besides, plants that shoot their roots deep are often supplied with moisture, when those near the surface are parched with drought.

To render the plants of sainfoin vigorous, it is necessary that they be sown thin. The best method of doing this is by a drill; because, when sown in this manner, not only the weeds, but also the supernumerary plants, can easily be removed. It is several years before sainfoin comes to its full strength; and the number of plants sufficient to stock a field, while in this imperfect state, will make but a poor crop for the first year or two. It is therefore necessary that it be sown in such a manner as to make it easy to take up plants

180

Culture of sainfoin.

Practice. in such numbers, and in such order, as always to leave in the field the proper number in their proper places. This can only be done, with propriety, by sowing the plants in rows by a drill. Supposing a field to be drilled in rows at ten inches distance, the partitions may be hand-hoed, and the rows dressed in such a manner as to leave a proper number of plants. In this situation the field may remain two years; then one-fourth of the rows may be taken out in pairs, in such a manner as to make the beds of fifty inches, with six rows in each, and intervals of thirty inches, which may be ploughed. Next year, another fourth of the rows may be taken out in the same manner, so as to leave double rows with partitions of ten inches, and intervals of thirty: All of which may be hoed at once or alternately, as it may be found most convenient.

The great quantity of this grass which the writers on this subject assure us may be raised upon an acre, and the excellency and great value of the hay made of it, should induce farmers to make a complete trial of it, and even to use the spade in place of the hoe, or hoe-plough, if necessary.

The plants taken up from a field of sainfoin may be set in another field; and if the transplanting of this grass succeeds as well as the transplanting of lucerne has done with Mr Lunin de Chateauvieux, the trouble and expence will be sufficiently recompensed by the largeness of the crops. In transplanting, it is necessary to cut off great part of the long tap-root: this will prevent it from striking very deep into the soil, and make it push out large roots in a sloping direction from the cut end of the tap-root. Sainfoin managed in this manner, will thrive even on shallow land that has a wet bottom, provided it be not overstocked with plants.

Whoever inclines to try the culture of this grass in Scotland, should take great pains in preparing the land, and making it as free from weeds as possible.

In England, as the roots strike deep in that chalky soil, this plant is not liable to be so much injured by drought as other grasses are, whose fibres lie horizontally, and lie near the surface. The quantity of hay produced is greater and better in quality than any other. But there is one advantage attending this grass, which renders it superior to any other; and that arises from feeding with it milch cows. The prodigious increase of milk which it makes is astonishing, being nearly double that produced by any other green food. The milk is also better, and yields more cream than any other; and the butter procured from it much better coloured and flavoured.

The following remarks by an English farmer are made from much experience and observation.

Sainfoin is much cultivated in those parts where the soil is of a chalky kind. It will always succeed well where the roots run deep; the worst soil of all for it is where there is a bed of cold wet clay, which the tender fibres cannot penetrate. This plant will make a greater increase of produce, by at least 30 times, than common grass or turf on poor land. Where it meets with chalk or stone, it will extend its roots through the cracks and chinks to a very great depth in search of nourishment. The dryness is of more

consequence than the richness of land for sainfoin; although land that is both dry and rich will always produce the largest crops.

It is very commonly sowed broadcast; but it is found to answer best in drills, especially if the land be made fine by repeated ploughing, rolling, and harrowing. Much depends on the depth which this seed is sown. If it be buried more than an inch deep, it will seldom grow; and if left uncovered, it will push out its roots above ground, and these will be killed by the air. March and the beginning of April are the best seasons for sowing it, as the severity of winter and the drought of summer are equally unfavourable to the young plants. A bushel of seed sown broadcast, or half that quantity in drills, if good, is sufficient for an acre. The drills should be 30 inches apart, to admit of horse-hoeing between them. Much, however, depends on the goodness of the seed, which may be best judged of by the following marks.

The husk being of a bright colour, the kernel plump, of a grey or bluish colour without, and, if cut across, greenish and fresh within; if it be thin and furrowed, and of a yellowish cast, it will seldom grow. When the plants stand single, and have room to spread, they produce the greatest quantity of herbage, and the seed ripens best. But farmers in general, from a mistaken notion of all that appears to be waste ground being unprofitable, plant them so close, that they choke and impoverish each other, and often die in a few years. Single plants run deepest and draw most nourishment; they are also easiest kept free from weeds. A single plant will often produce half a pound of hay, when dry. On rich land this plant will yield two good crops in a year, with a moderate share of culture. A good crop must not be expected the first year; but, if the plants stand not too thick, they will increase in size the second year prodigiously.

No cattle should be turned on the field the first winter after the corn is off with which it was sown, as their feet would injure the young plants. Sheep should not come on the following summer, because they would bite off the crown of the plants, and prevent their shooting again. A small quantity of soap ashes as a top-dressing will be of great service, if laid on the first winter.

If the sainfoin be cut just before it comes into bloom, it is admirable food for horned cattle; and if cut thus early, it will yield a second crop the same season. But if it proves a wet season, it is better to let it stand till its bloom be perfected; for great care must be taken, in making it into hay, that the flowers do not drop off, as cows are very fond of them; and it requires more time than other hay in drying. Sainfoin is so excellent a fodder for horses, that they require no oats while they eat it, although they be worked hard all the time. Sheep will also be fattened with it faster than with any other food.

If the whole season for cutting proves very rainy, it is better to let the crop stand for seed, as that will amply repay the loss of the hay; because it will not only fetch a good price, but a peck of it will go as far as a peck and a half of oats for horses.

The best time of cutting the seeded sainfoin is, when the greatest part of the seed is well filled, the first
blow

181
Remarks
on the cul-
ture of sain-
foin in
England.

^{Practice.} blown ripe, and the last blown beginning to open. For want of this care some people have lost most of their seed by letting it stand too ripe. Seeded sainfoin should always be cut in a morning or evening, when the dews render the stalks tender. If cut when the sun shines hot, much of the seed will fall out and be lost.

¹⁸²
Its excellence as food for cows.

An acre of very ordinary land, when improved by this grass, will maintain four cows very well from the first of April to the end of November; and afford, besides, a sufficient store of hay to make the greater part of their food the four months following.

If the soil be tolerably good, a field of sainfoin will last from 15 to 20 years in prime; but at the end of seven or eight years, it will be necessary to lay on a moderate coat of well-rotted dung; or, if the soil be very light and sandy, of marl. By this means the future crops, and the duration of the plants in health and vigour, will be greatly increased and prolonged. Hence it will appear, that for poor land there is nothing equal to this grass in point of advantage to the farmer.

Clover will last only two years in perfection; and often, if the soil be cold and moist, near half the plants will rot, and bald patches be found in every part of the field the second year. Besides, from our frequent rains during the month of September, many crops left for feeding are lost. But from the quantity and excellent quality of this grass (sainfoin), and its ripening earlier, and continuing in vigour so much longer, much risk and certain expence is avoided, and a large annual profit accrues to the farmer.

¹⁸³
Culture of lucerne.

The writers on agriculture, ancient as well as modern, bestow the highest encomiums upon lucerne as affording excellent hay, and producing very large crops. Lucerne remains at least 10 or 12 years in the ground, and produces about eight tons of hay upon the Scots acre. There is but little of it cultivated in Scotland. However, it has been tried in several parts of that country; and it is found, that, when the seed is good, it comes up very well, and stands the winter frost. But the chief thing which prevents this grass from being more used in Scotland, is the difficulty of keeping the soil open and free from weeds. In a few years the surface becomes so hard, and the turf so strong, that it destroys the lucerne before the plants have arrived at their greatest perfection: so that lucerne can scarce be cultivated with success there, unless some method be fallen upon of destroying the natural grass, and prevent the surface from becoming hard and impenetrable. This cannot be done effectually by any other means than horse-hoeing. This method was first proposed by Mr Tull, and afterwards practised successfully by M. de Chateauxvieux near Geneva. It may be of use therefore to give a view of that gentleman's method of cultivating lucerne.

He does not mention any thing particular as to the manner of preparing the land; but only observes in general, that no pains should be spared in preparing it. He tried the sowing of lucerne both in rows upon the beds where it was intended to stand, and likewise the sowing it in a nursery, and afterwards transplanting it into the beds prepared for it. He prefers transplanting; because, when transplanted, part of the tap-root

^{Practice.} is cut off, and the plant shoots out a number of lateral branches from the cut part of the root, which makes it spread its roots nearer the surface, and consequently renders it more easily cultivated: besides, this circumstance adapts it to a shallow soil, in which, if left in its natural state, it would not grow.

The transplanting of lucerne is attended with many advantages. The land may be prepared in the summer for receiving the plants from the nursery in autumn; by which means the field must be in a much better situation than if the seed had been sown upon it in the spring. By transplanting, the rows can be made more regular, and the intended distances more exactly observed; and consequently the hoeing can be performed more perfectly, and with less expence. Mr Chateauxvieux likewise tried the lucerne in single beds three feet wide, with single rows; in beds three feet nine inches wide, with double rows; and in beds four feet three inches wide, with triple rows. The plants in the single rows were six inches asunder, and those in the double and triple rows were about eight or nine inches. In a course of three years he found, that a single row produced more than a triple row of the same length. The plants of lucerne, when cultivated by transplantation, should be at least six inches asunder, to allow them room for extending their crowns.

He further observes, that the beds or ridges ought to be raised in the middle; that a small trench, two or three inches deep, should be drawn in the middle; and that the plants ought to be set in this trench, covered with earth up to the neck. He says, that if the lucerne be sown in spring, and in a warm soil, it will be ready for transplanting in September; that, if the weather be too hot and dry, the transplanting should be delayed till October; and that, if the weather be unfavourable during both these months, this operation must be delayed till spring. He further directs, that the plants should be carefully taken out of the nursery, so as not to damage the roots; that the roots be left only about six or seven inches long; that the green crops be cut off within about two inches of the crown; that they be put into water as soon as taken up, there to remain till they are planted; and that they should be planted with a planting-stick, in the same manner as cabbages.

He does not give particular directions as to the times of horse-hoeing; but only says in general, that the intervals should be stirred once in the month during the whole time that the lucerne is in a growing state. He likewise observes, that great care ought to be taken not to suffer any weeds to grow among the plants, at least for the first two or three years; and for this purpose, that the rows, as well as the edges of the intervals where the plough cannot go, should be weeded by the hand.

Burnet is peculiarly adapted to poor land; besides, it proves an excellent winter-pasture when hardly any thing else vegetates. Other advantages are, It makes good butter; it never blows or swells cattle; it is fine pasture for sheep; and will flourish well on poor, light, sandy, or stony soils, or even on dry chalk hills.

¹⁸⁴
Culture of burnet.

The cultivation of it is neither hazardous nor expen-
five.

Practice.

five. If the land is prepared as is generally done for turnips, there is no danger of its failing. After the first year, it will be attended with very little expence, as the flat circular spread of its leaves will keep down, or prevent the growth of weeds.

On the failure of turnips, either from the fly or the black worm, some of our farmers have sown the land with burnet, and in March following had a fine pasture for their sheep and lambs. It will perfect its seed twice in a summer; and this seed is said to be as good as oats for horses; but it is too valuable to be applied to that use.

It is sometimes sown late in the spring with oats and barley, and succeeds very well; but it is best to sow it singly in the beginning of July, when there is a prospect of rain, on a small piece of land, and in October following, transplant it in rows two feet apart, and about a foot distant in the rows. This is a proper distance, and gives opportunity for hoeing the intervals in the succeeding spring and summer.

After it is fed down with cattle, it should be harrowed clean. Some horses will not eat it freely at first, but in two or three days they are generally very fond of it. It affords rich pleasant milk, and in great plenty.

A gentleman farmer near Maidstone some years since sowed four acres as soon as the crop of oats were got off, which was the latter end of August. He threw in 12 pounds of seed per acre, broadcast; and no rain falling until the middle of September, the plants did not appear before the latter end of that month. There was however a good crop, and in the spring he set the plants out with a turnip-hoe, leaving them about a foot distant from each other. But the drill method is preferable, as it saves more than half the seed. The land was a poor dry gravel, not worth three shillings an acre for any thing else.

The severest frost never injures this plant; and the oftener it is fed the thicker are its leaves, which spring constantly from its root.

SECT. V. *Rotation of Crops.*

185
Rotation of
crops.

No branch of husbandry requires more skill and sagacity than a proper rotation of crops, so as to keep the ground always in heart, and yet to draw out of it the greatest profit possible. Some plants rob the soil, others are gentle to it: some bind, others loosen. The nice point is, to intermix crops, so as to make the greatest profit consistently with keeping the ground in trim. In that view, the nature of the plants employed in husbandry must be accurately examined.

186
Culmiferous and leguminous
plants.* N^o 120,
121.

The difference between culmiferous and leguminous plants, is occasionally mentioned above*. With respect to the present subject, a closer inspection is necessary. Culmiferous plants, having small leaves and few in number, depend mostly on the soil for nourishment, and little on the air. During the ripening of the seed, they draw probably their whole nourishment from the soil; as the leaves by this time, being dry and withered, must have lost their power of drawing nourishment from the air. Now, as culmiferous plants are chiefly cultivated for their seed, and are not cut down till the seed be fully ripe, they may be pronounced all of them to be robbers, some more, some less. But such plants, while young, are all leaves; and in that state draw

Practice.

most of their nourishment from the air. Hence it is, that where cut green for food to cattle, a culmiferous crop is far from being a robber. A hay-crop accordingly, even where it consists mostly of rye-grass, is not a robber, provided it be cut before the seed is formed; which at any rate it ought to be, if one would have hay in perfection. And the foggage, excluding the frost by covering the ground, keeps the roots warm. A leguminous plant, by its broad leaves, draws much of its nourishment from the air. A cabbage, which has very broad leaves, and a multitude of them, owes its growth more to the air than to the soil. One fact is certain, that a cabbage cut and hung up in a damp place, preserves its verdure longer than other plants. At the same time, a seed is that part of a plant which requires the most nourishment; and for that nourishment a culmiferous plant must be indebted entirely to the soil. A leguminous crop, on the contrary, when cut green for food, must be very gentle to the ground. Pease and beans are leguminous plants; but being cultivated for seed, they seem to occupy a middle station: their seed makes them more severe than other leguminous crops cut green; their leaves, which grow till reaping, make them less severe than a culmiferous plant left to ripen.

These plants are distinguished no less remarkably by the following circumstance. All the seeds of a culmiferous plant ripen at the same time. As soon as they begin to form, the plant becomes stationary, the leaves wither, the roots cease to push, and the plant when cut down is blanched and sapless. The seeds of a leguminous plant are formed successively: flowers and fruit appear at the same time in different parts of the plant. This plant accordingly is continually growing, and pushing its roots. Hence the value of bean or pease straw above that of wheat or oats: the latter is withered and dry when the crop is cut; the former, green and succulent. The difference therefore, with respect to the soil, between a culmiferous and leguminous crop, is great. The latter, growing till cut down, keeps the ground in constant motion, and leaves it to the plough loose and mellow. The former gives over growing long before reaping; and the ground, by want of motion, turns compact and hard. Nor is this all. Dew falling on a culmiferous crop after the ground begins to harden, rests on the surface, and is sucked up by the next sun. Dew that falls on a leguminous crop, is shaded from the sun by the broad leaves, and sinks at leisure into the ground. The ground accordingly, after a culmiferous crop, is not only hard, but dry: after a leguminous crop, it is not only loose, but soft and unctuous.

Of all culmiferous plants, wheat is the most severe, by the long time it occupies the ground without admitting a plough. And as the grain is heavier than that of barley or oats, it probably requires more nourishment than either. It is observed above, that as pease and beans draw part of their nourishment from the air by their green leaves while allowed to stand, they draw the less from the ground; and by their constant growing they leave it in good condition for subsequent crops. In both respects they are preferable to any culmiferous crop.

Culmiferous crops, as observed above, are not robbers when cut green: the soil, far from hardening, is kept:

Practice. kept in constant motion by the pushing of the roots, and is left more tender than if it had been left at rest without any bearing crop.

Bulbous-rooted plants are above all successful in dividing and pulverizing the soil. Potato-roots grow six, eight, or ten inches under the surface; and, by their size and number, they divide and pulverize the soil better than can be done by the plough; consequently, whatever be the natural colour of the soil, it is black when a potato-crop is taken up. The potato, however, with respect to its quality of dividing the soil, must yield to a carrot or parsnip; which are large roots, and pierce often to the depth of 18 inches. The turnip, by its tap-root, divides the soil more than can be done by a fibrous-rooted plant; but as its bulbous root grows mostly above ground, it divides the soil less than the potato, the carrot, or the parsnip. Red clover, in that respect, may be put in the same class with turnip.

Whether potatoes or turnip be the more gentle crop, appears a puzzling question. The former bears seed, and probably draws more nourishment from the soil than the latter, when cut green. On the other hand, potatoes divide the soil more than turnip, and leave it more loose and friable. It appears no less puzzling, to determine between cabbage and turnip: the former draws more of its nourishment from the air, the latter leaves the soil more free and open.

The result of the whole is what follows: Culmiferous plants are robbers; some more, some less: they at the same time bind the soil; some more, some less. Leguminous plants in both respects are opposite: if any of them rob the soil, it is in a very slight degree; and all of them without exception loosen the soil. A culmiferous crop, however, is generally the more profitable: but few soils can long bear the burden of such crops, unless relieved by interjected leguminous crops. These, on the other hand, without a mixture of culmiferous crops, would soon render the soil too loose.

These preliminaries will carry the farmer some length in directing a proper rotation of crops. Where dung, lime, or other manure, can be procured in plenty to recruit the soil after severe cropping, no rotation is more proper or profitable in a strong soil, than wheat, pease or beans, barley, oats, fallow. The whole farm may be brought under this rotation, except so far as hay is wanted. But as such command of manure is rare, it is of more importance to determine what should be the rotation when no manure can be procured but the dung collected in the farm. Considering that culmiferous crops are the more profitable in rich land, it would be proper to make them more frequent than the other kind. But as there are few soils in Scotland that will admit such frequent culmiferous crops without suffering, it may be laid down as a general rule, that alternate crops, culmiferous and leguminous, ought to form the rotation. Nor are there many soils that will stand good, even with this favourable rotation, unless relieved from time to time by pasturing a few years. If such extended rotation be artfully carried on, crops without end may be obtained in a tolerable good soil, without any manure but what is produced in the farm.

It is scarce necessary to be mentioned, being known to every farmer that clay answers best for wheat,

moist clay for beans, loam for barley and pease, light soil for turnip, sandy soil for rye and buck-wheat; and that oats thrive better in coarse soil than any other grain. Now, in directing a rotation, it is not sufficient that a culmiferous crop be always succeeded by a leguminous: attention must also be given, that no crop be introduced that is unfit for the soil. Wheat, being a great binder, requires more than any other crop a leguminous crop to follow. But every such crop is not proper: potatoes are the greatest openers of soil; but they are improper in a wheat soil. Neither will turnip answer, because it requires a light soil. A very loose soil, after a crop of rye, requires rye-grass to bind it, or the treading of cattle in pasturing: but to bind the soil, wheat must not be ventured; for it succeeds ill in loose soil.

Another consideration of moment in directing the rotation, is to avoid crops that encourage weeds. Pease is the fittest of all crops for succeeding to wheat, because it renders the ground loose and mellow, and the same soil agrees with both. But beware of pease, unless the soil be left by the wheat perfectly free of weeds; because pease, if not an extraordinary crop, fosters weeds. Barley may be ventured after wheat, if the farmer be unwilling to lose a crop. It is indeed a robber; better, however, any crop, than run the hazard of poisoning the soil with weeds. But to prevent the necessity of barley after wheat, the land ought to be fallowed before the wheat: it cleans the ground thoroughly, and makes pease a secure crop after wheat. And after a good crop of pease, barely never fails. A horse-hoed crop of turnip is equal to a fallow for rooting out weeds; but turnip does not suit land that is proper for wheat. Cabbage does well in wheat soil; and a horse-hoed crop of cabbage, which eradicates weeds, is a good preparation for wheat to be succeeded by pease; and a crop of beans diligently hand-hoed, is in that view little inferior. As red clover requires the ground to be perfectly clean, a good crop of it ensures wheat, and next pease. In loam, a drilled crop of turnip or potatoes prepares the ground, equal to a fallow, for the same succession.

Another rule is, to avoid a frequent repetition of the same species; for to produce good crops, change of species is no less necessary than change of seed. The same species returning every second or third year, will infallibly degenerate, and be a scanty crop. This is remarkably the case of red clover. Nor will our fields bear pleasantly perpetual crops of wheat after fallow, which is the practice of some English farmers.

Hitherto of rotation in the same field. We add one rule concerning rotation in different fields; which is, to avoid crowding crops one after another in point of time; but to choose such as admit intervals sufficient for leisurely dressing, which gives opportunity to manage all with the same hands, and with the same cattle; for example, beans in January or February, pease and oats in March, barley and potatoes in April, turnip in June or July, wheat and rye in October.

For illustrating the foregoing rules, a few instances of exceptionable rotations will not be thought amiss. The following is an usual rotation in Norfolk. First, wheat after red clover. Secondly, barley. Third, turnip. Fourth, barley with red clover. Fifth, clover cut for hay. Sixth, a second year's crop of clover commonly

Practice.
187
The nature of soil considered, with regard to the rotation of crops.

188

Exceptionable rotations.

Practice.

commonly pastured. Dung is given to the wheat and turnip.—Against this rotation several objections lie. Barley after wheat is improper. The two crops of barley are too near together. The second crop of clover must be very bad, if pasturing be the best way of consuming it; and if bad, it is a great encourager of weeds. But the strongest objection is, that red clover repeated so frequently in the same field cannot fail to degenerate; and of this the Norfolk farmers begin to be sensible.—Salton in East Lothian is a clay soil; and the rotation there is, Wheat after fallow and dung. Second, barley after two ploughings; the one before winter, the other immediately before the seed is sown. Third, oats. Fourth, pease. Fifth, barley. Sixth, oats: and then fallow. This rotation consists chiefly of robbing crops. Pease are the only leguminous crop, which even with the fallow is not sufficient to loosen a stiff soil. But the soil is good, which in some measure hides the badness of the rotation.—About Seaton, and all the way from Preston to Gosford, the ground is still more severely handled: wheat after fallow and dung, barley, oats, pease, wheat, barley, oats, and then another fallow. The soil is excellent; and it ought indeed to be so, to support many rounds of such cropping.

In the parishes of Tranent, Aberlady, Dirleton, North-Berwick, and Athelstoneford, the following rotations were formerly universal, and to this day are much more frequent than any other mode.

1. After fallow with dung, wheat, barley, oats, pease and beans, barley, oats, wheat.
2. After fallow and dung, barley, oats, pease and beans, wheat, barley, oats pease, wheat.
3. After fallow and dung, wheat, oats, pease, barley, oats, wheat.
4. After fallow and dung, barley, oats, beans, wheat, pease, barley, oats.

In the several Tours of Young the itinerant farmer, are found, in the best counties of England, examples without end, of rotations no less exceptionable than many of those mentioned.

189
Fields not
to be kept
too long in
pasture.

Where a field is laid down for pasture in order to be recruited, it is commonly left in that state many years; for it is the universal opinion, that the longer it lies, the richer it becomes for bearing corn. This may be true; but in order to determine the mode of cropping, the important point is, what upon the whole is the most profitable rotation; not what may produce luxuriant crops at a distant period. Upon that point, it may be affirmed, that the farmer who keeps a field in pasture beyond a certain time, loses every year considerably; and that a few luxuriant crops of corn, after 20 years of pasture, and still more after 30, will not make up the loss.

Pasture-grass, while young, maintains many animals; and the field is greatly recruited by what they drop; it is even recruited by hay crops, provided the grass be cut before feeding. But as old grass yields little profit, the field ought to be taken up for corn when the pasture begins to fail; and after a few crops, it ought to be laid down again with grass-seeds. Seduced by a chimerical notion, that a field, by frequent corn-crops, is fatigued and requires rest like a labouring man or animal, careful farmers give long rest to their fields by pasture, never adverting that it affords little profit. It

ought to be their study, to improve their soil, by making it free, and also retentive of moisture. If they accomplish these ends, they need not be afraid of exhausting the soil by cropping.

Practice.

Where a farmer has access to no manure but what is his own production, the case under consideration, there are various rotations of crops, all of them good though perhaps not equally so. We shall begin with two examples, one in clay, and one in free soil, each of the farms 90 acres. Six acres are to be inclosed for a kitchen-garden, in which there must be annually a crop of red clover, for summer-food to the working cattle. As there are annually 12 acres in hay, and 12 in pasture, a single plough with good cattle will be sufficient to command the remaining 60 acres.

190
Examples
of rotations.

Rotation in a clay soil.

Inclor.	1775.	1776.	1777.	1778.	1779.	1780.
1.	Fallow.	Wheat.	Pease.	Barley.	Hay.	Oats.
2.	Wheat.	Pease.	Barley.	Hay.	Oats.	Fallow.
3.	Pease.	Barley.	Hay.	Oats.	Fallow.	Wheat.

6.	Oats.	Fallow.	Wheat.	Pease.	Barley.	Hay.
7.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.

When the rotation is completed, the seventh inclosure having been six years in pasture, is ready to be taken up for a rotation of crops which begins with oats in the year 1781, and proceeds as in the sixth inclosure. In the same year 1781, the fifth inclosure is made pasture, for which it is prepared by sowing pasture grass seeds with the barley of the year 1780. And in this manner may the rotation be carried on without end. Here the labour is equally distributed; and there is no hurry nor confusion. But the chief property of this rotation is, that two culmiferous or white-corn crops are never found together; by a due mixture of crops, the soil is preserved in good heart without any adventitious manure. At the same time, the land is always producing plentiful crops: neither hay nor pasture get time to degenerate. The whole dung is laid upon the fallow.

Every farm that takes a grass-crop into the rotation must be inclosed, which is peculiarly necessary in a clay soil, as nothing is more hurtful to clay than poaching.

Rotation in a free soil.

Inclor.	1775.	1776.	1777.	1778.	1779.	1780.
1.	Turnip.	Barley.	Hay.	Oats.	Fallow.	Wheat.
2.	Barley.	Hay.	Oats.	Fallow.	Wheat.	Turnip.
3.	Hay.	Oats.	Fallow.	Wheat.	Turnip.	Barley.
4.	Oats.	Fallow.	Wheat.	Turnip.	Barley.	Hay.

7.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.

For the next rotation, the seventh inclosure is taken up for corn, beginning with an oat-crop, and proceeding in the order of the fourth inclosure; in place of which, the third inclosure is laid down for pasture by sowing pasture-grasses with the last crop in that inclosure, being barley. This rotation has all the advantages

ges

^{Practice.} ges of the former. Here the dung is employed on the turnip-crop.

This leads to the hands that are commonly engaged ^{Practice.} to cut down corn. In Scotland, the universal practice was, to provide a number of hands, in proportion to the extent of the crop, without regard to the time of ripening. By this method, the reapers were often idle for want of work; and what is much worse, they had often more work than they could overtake, and ripe fields were laid open to shaking winds. The Lothians have long enjoyed weekly markets for reapers, where a farmer can provide himself with the number he wants; and this practice is creeping into neighbouring shires. Where there is no opportunity of such markets, neighbouring farmers ought to agree in borrowing and lending their reapers.

One should imagine, that a caution against cutting corn when wet is unnecessary; yet from the impatience of farmers to prevent shaking, no caveat is more so. Why do they not consider, that corn standing dries in half a day; when, in a close sheaf, the weather must be favourable if it dry in a month? in moist weather it will never dry.

With respect to the manner of cutting, we must ¹⁹³premise, that barley is of all the most difficult grain to be ^{Manner of cutting.} dried for keeping. Having no hulk, rain has easy access; and it has a tendency to malten when wet. Where the ground is properly smoothed by rolling, it seems best to cut it down with the scythe. This manner being more expeditious than the sickle, removes it sooner from danger of wind; and gives a third more straw, which is a capital article for dung, where a farm is at a distance from other manure. We except only corn that has lodged; for there the sickle is more convenient than the scythe. As it ought to be dry when cut, bind it up directly: if allowed to lie any time in the swath, it is apt to be discoloured.—Barley sown with grass-seeds, red clover especially, requires a different management. Where the grass is cut along with it, the difficulty is great of getting it so dry as to be ventured in a stack. The best way is, to cut the barley with a sickle above the clover, so as that nothing but clean barley is bound up. Cut with a scythe the stubble and grass: they make excellent winter-food. The same method is applicable to oats; with this only difference, that when the field is exposed to the south-west wind, it is less necessary to bind immediately after mowing. As wheat commonly grows higher than any other grain, it is difficult to manage it with the scythe; for which reason the sickle is preferred in England. Pease and beans grow so irregularly, as to make the sickle necessary.

The best way for drying pease, is to keep separate ¹⁹⁴the handfuls that are cut: though in this way they wet ^{Drying of pease.} easily, they dry as soon. In the common way of heaping pease together for composing a sheaf, they wet as easily, and dry not near so soon. With respect to beans, the top of the handful last cut, ought to be laid on the bottom of the former; which gives ready access to the wind. By this method pease and beans are ready for the stack in half the ordinary time.

A sheaf commonly is made as large as can be ¹⁹⁵contained in two lengths of the corn made into a rope. ^{Size of sheaves.} To save frequent tying, the binder presses it down with his knee, and binds it so hard as totally to exclude the air. If there be any moisture in the crop, which seldom fails, a process of fermentation and putrefaction commences

in

We proceed to consider what rotation is proper for carse clay. The farm we propose consists of 73 acres. Nine are to be inclosed for a kitchen garden, affording plenty of red clover to be cut green for the farm-cattle. The remaining 64 acres are divided into four inclosures, 16 acres each, to be cropped as in the following table.

Inclof.	1775.	1776.	1777.	1778.
1.	Beans.	Barley.	Hay.	Oats.
2.	Barley.	Hay.	Oats.	Beans.
3.	Hay.	Oats.	Beans.	Barley.
4.	Oats.	Beans.	Barley.	Hay.

Here the dung ought to be applied to the barley.

Many other rotations may be contrived, keeping to the rules above laid down. Fallow, for example, wheat, pease and beans, barley, cabbage, oats, for clay. Here dung must be given both to the wheat and cabbage. For free soil, drilled turnip, barley, red clover, wheat upon a single furrow, drilled potatoes, oats. Both the turnip and potatoes must have dung. Another for free soil: turnip drilled and dunged, red clover, wheat on a single furrow with dung, pease, barley, potatoes, oats. The following rotation has proved successful in a soil proper for wheat. 1. Oats with red clover, after fallow, without dung. 2. Hay. The clover-stubble dunged, and wheat sown the end of October with a single furrow. 3. Wheat. 4. Pease. 5. Barley. Fallow again. Oats are taken the first crop, to save the dung for the wheat. Oats always thrive on a fallow, though without dung, which is not the case of barley. But barley seldom fails after pease. In strong clay soil, the following rotation answers. 1. Wheat after fallow and dung. 2. Beans sown under furrow as early as possible. Above the beans, sow pease end of March, half a boll per acre, and harrow them in. The two grains will ripen at the same time. 3. Oats or barley on a winter furrow with grass-seeds. 4. Hay for one year or two; the second growth pastured. Lay what dung can be spared on the hay stubble, and sow wheat with a single furrow. 5. Wheat. 6. Beans or pease. 7. Oats. Fallow again.

SECT. VI. *Of Reaping Corn and Hay Crops, and Storing them up for use.*

¹⁹¹Of ripeness. CULMIFEROUS plants are ripe when the stem is totally white: they are not fully ripe if any green streaks remain. Some farmers are of opinion, that wheat ought to be cut before it is fully ripe. Their reasons are, first, that ripe wheat is apt to shake; and next, that the flour is not so good. With respect to the last, it is contrary to nature, that any feed can be better in an unripe state than when brought to perfection: nor will it be found so upon trial. With respect to the first, wheat, at the point of perfection, is not more apt to shake than for some days before: the hulk begins not to open till after the seed is fully ripe; and then the suffering the crop to stand becomes ticklish: after the minute of ripening, it should be cut down in an instant, if possible.

Practice.

in the sheaf; which is perfected in the stack, to the destruction both of corn and straw. How stupid is it, to make the size of a sheaf depend on the height of the plants! By that rule, a wheat-sheaf is commonly so weighty, as to be unmanageable by ordinary arms: it requires an effort to move it, that frequently bursts the knot, and occasions loss of grain, beside the trouble of a second tying. Sheaves ought never to be larger than can be contained in one length of the plant, cut close to the ground; without admitting any exception, if the plants be above eighteen inches high. The binder's arm can then compress the sheaf sufficiently, without need of his knee. The additional hands that this way of binding may require, are not to be regarded, compared with the advantage of drying soon. Corn thus managed may be ready for the stack in a week; it seldom in the ordinary way requires less than a fortnight, and frequently longer. Of a small sheaf compressed by the arm only, the air pervades every part; nor is it so apt to be unloosed as a large sheaf, however firmly bound. We omit the gathering of sheaves into shocks, because the common method is good, which is to place the shocks directed to the south-west, in order to resist the force of the wind. Five sheaves on each side make a sufficient flay; and a greater number cannot be covered with two head-sheaves.

196
Carrying
off the
victual.

Every article is of importance that hastens the operation in a country, like Scotland, subjected to unequal harvest-weather; for which reason, the most expeditious method should be chosen for carrying corn from the field to the stack-yard. Our carriages are generally too small or too large. A sledge is a very awkward machine: many hands are required, and little progress made. Waggon and large carts are little less dilatory, as they must stand in the yard till unloaded sheaf by sheaf. The best way is, to use long carts moveable upon the axle, so as at once to throw the whole load on the ground; which is forked up to the stack by a hand appointed for that purpose. By this method, two carts will do the work of four or five.

197
Of stacking.

Building round stacks in the yard is undoubtedly preferable to housing corn. There it is shut up from the air; and it must be exceedingly dry, if it contract not a mustiness, which is the first step to putrefaction. Add to this, that in the yard, a stack is preserved from rats and mice by being set on a pedestal; whereas no method has hitherto been invented for preserving corn in a house from such destructive vermin. The proper manner of building, is to make every sheaf incline downward from its top to its bottom. Where the sheaves are laid horizontally, the stack will take in rain both above and below. The best form of a stack is that of a cone placed on a cylinder; and the top of the cone should be formed with three sheaves drawn to a point. If the upper part of the cylinder be a little wider than the under, so much the better.

198
Covering
the stacks.

The delaying to cover a stack for two or three weeks, though common, is, however, exceedingly absurd; for if much rain fall in the interim, it is beyond the power of wind to dry the stack. Vegetation begun in the external parts, shuts out the air from the internal; and to prevent a total putrefaction, the stack must be thrown down, and exposed to the air, every sheaf. In order to have a stack covered the moment it is finished, straw and ropes ought to be ready; and

N^o 8.

the covering ought to be so thick as to be proof against rain.

Practice.

Scotland is subject not only to floods of rain, but to high winds. Good covering guards against the former, and ropes artfully applied guards against the latter. The following is a good mode. Take a hay-rope well twisted, and surround the stack with it, two feet or so below the top. Surround the stack with another such rope immediately below the easing. Connect these two with ropes in an up-and-down position, distant from each other at the easing about five or six feet. Then surround the stack with other circular ropes parallel to the two first mentioned, giving them a twist round every one of those that lie up and down, by which the whole will be connected together in a sort of net-work. What remains is, to finish the two feet at the top of the stack. Let it be covered with bunches of straw laid regularly up and down; the under part to be put under the circular rope first mentioned, which will keep it fast, and the upper part be bound by a small rope artfully twisted, commonly called *the crown of the stack*. This method is preferable to the common way of laying long ropes over the top of the stack, and tying them to the belting-rope; which flattens the top, and makes it take in rain. A stack covered in the way here described, will stand two years secure both against wind and rain; a notable advantage in this variable climate.

The great aim in making hay is, to preserve as much of the sap as possible. All agree in this; and yet differ widely in the means of making that aim effectual. To describe all the different means would be equally tedious and unprofitable. We shall confine ourselves to two, which appear preferable to all others. A crop of rye-grass and yellow clover ought to be spread as cut. A day or two after, when the dew is evaporated, rake it into a number of parallel rows along the field, termed *wind-rows*, for the convenience of putting it up into small cocks. After turning the rows once and again, make small cocks weighing a stone or two. At the distance of two days or so, put two cocks into one, observing always to mix the tops and bottoms together, and to take a new place for each cock, that the least damage possible may be done to the grass. Proceed in putting two cocks into one, till sufficiently dry for tramp-ricks of 100 stone each. The easiest way of erecting tramp-ricks, is to found a rick in the middle of the row of cocks that are to compose it. The cocks may be carried to the rick by two persons joining arms together. When all the cocks are thus carried to the rick within the distance of 40 yards or so, the rest of the cocks will be more expeditiously carried to the rick, by a rope wound about them and dragged by a horse. Two ropes are sufficient to secure the ricks from wind the short time they are to stand in the field. In the year 1775, 10,000 stone were put into tramp-ricks the fourth day after cutting. In a country so wet as many parts of Scotland are, expedition is of mighty consequence in the drying both of hay and corn. With respect to hay intended for horned cattle, it is by the generality held an improvement, that it be heated a little in the stack. But we violently suspect this doctrine to have been invented for excusing indolent management. An ox, it is true, will eat such hay; but it will always be found that he prefers sweet hay; and

199
Hay-making.

^{Practice.} it cannot well be doubted, but that such hay is the most salutary and the most nourishing.

²⁰⁰ Hay of red clover. The making hay consisting chiefly of red clover, requires more care. The season of cutting is the last week of June, when it is in full bloom; earlier it may be cut, but never later. To cut it later would indeed produce a weightier crop; but a late first cutting makes the second also late; perhaps too late for drying. At the same time, the want of weight in an early first cutting, is amply compensated by the weight of the second.

When the season is too variable for making hay of the second growth, mix straw with that growth, which will be a substantial food for cattle during winter. This is commonly done by laying strata of the straw and clover alternately in the stack. But by this method, the strata of clover, if they do not heat, turn mouldy at least, and unpalatable. The better way is, to mix them carefully with the hand before they be put into the stack. The dry straw imbibes moisture from the clover and prevents heating.

²⁰¹ Other method. But the best method of hay-making seems to be that recommended by Mr Anderson*. "Instead," says he, "of allowing the hay to lie, as usual in most places, for some days in the swathe after it is cut, and afterwards alternately putting it up into cocks and spreading it out, and tedding it in the sun, which tends greatly to bleach the hay, exhales its natural juices, and subjects it very much to the danger of getting rain, and thus runs a great risk of being good for little, I make it a general rule, if possible, never to cut hay but when the grass is quite dry; and then make the gatherers follow close upon the cutters,—putting it up immediately into small cocks about three feet high each when new put up, and of as small a diameter as they can be made to stand with; always giving each of them a slight kind of thatching, by drawing a few handfuls of the hay from the bottom of the cock all around, and laying it lightly upon the top with one of the ends hanging downwards. This is done with the utmost ease and expedition; and when it is once in that state, I consider my hay as in a great measure out of danger: for unless a violent wind should arise immediately after the cocks are put up, so as to overturn them, nothing else can hurt the hay; as I have often experienced, that no rain, however violent, ever penetrates into these cocks but for a very little way. And, if they are dry put up, they never fit together so closely as to heat; although they acquire, in a day or two, such a degree of firmness, as to be in no danger of being overturned by wind after that time, unless it blows a hurricane.

"In these cocks I allow the hay to remain, until, upon inspection, I judge that it will keep in pretty large tramp-cocks (which is usually in one or two weeks, according as the weather is more or less favourable, when two men, each with a long pronged pitch-

VOL. I. Part I.

fork, lift up one of these small cocks between them with the greatest ease, and carry them one after another to the place where the tramp-cock is to be built (A): and in this manner they proceed over the field till the whole is finished.

"The advantages that attend this method of making hay, are, That it greatly abridges the labour; as it does not require above the one-half of the work that is necessary in the old method of turning and tedding it: That it allows the hay to continue almost as green as when it is cut, and preserves its natural juices in the greatest perfection; for, unless it be the little that is exposed to the sun and air upon the surface of the cocks, which is no more bleached than every straw of hay saved in the ordinary way, the whole is dried in the most slow and equal manner that could be desired: and, lastly, That it is thus in a great measure secured from almost the possibility of being damaged by rain. This last circumstance deserves to be much more attended to by the farmer than it usually is at present; as I have seen few who are sufficiently aware of the loss that the quality of their hay sustains by receiving a slight shower after it is cut, and before it is gathered; the generality of farmers seeming to be very well satisfied if they get in their hay without being absolutely rotted; never paying the least attention to its having been several times wetted while the hay was making. But, if these gentlemen will take the trouble at any time to compare any parcel of hay that has been made perfectly dry, with another parcel from the same field that has received a shower while in the swathe, or even a copious dew, they will soon be sensible of a very manifest difference between them; nor will their horses or cattle ever commit a mistake in choosing between the two.

"Let it be particularly remarked, that in this manner of making hay, great care must be taken that it be dry when first put into the cocks; for, if it is in the least degree wet at that time, it will turn instantly mouldy, and fit together so as to become totally impervious to the air, and will never afterwards become dry till it is spread out to the sun. For this reason, if at any time during a course of good settled weather you should begin to cut in the morning before the dew is off the grass, keep back the gatherers till the dew is evaporated; allowing that which was first cut to lie till it is dry before it is cocked. In this case, you will almost always find that the uncut grass will dry sooner than that which has been cut when wet; and, therefore, the gatherers may always begin to put up that which is fresh cut before the other; which will usually require two or three hours to dry after the new-cut hay may be cocked. And if, at any time, in case of necessity, you should be obliged to cut your hay before it is dry, the same rule must be observed, always to allow it to remain in the swathe till it is quite dry: but, as there is always a great risk of being long in getting it

R r up,

(A) If the hay is to be carried to any considerable distance, this part of the labour may be greatly abridged, by causing the carriers take two long sticks of a sufficient strength, and having laid them down by the small cocks parallel to one another, at the distance of one and a half, or two feet asunder, let them lift three or four cocks, one after another, and place them carefully above the sticks, and then carry them altogether, as if upon a hand-barrow, to the place where the large rick is to be built.

^{Practice.}

Practice.

up, and as it never in this case *wins* (A) so kindly as if it had been dry cut, the farmer ought to endeavour, if possible, in all cases, to cut his hay only when dry; even if it should cost him some additional expence to the cutters, by keeping them employed at any other work, or even allowing them to remain idle, if the weather should be variable or rainy.

“ But if there is a great proportion of clover, and the weather should chance to be close and calm at the time, it may, on some occasions, be necessary to open up these cocks a little, to admit some fresh air into them; in which case, after they have stood a day or two, it may be of great use to turn these cocks and open them up a little, which ought to be done in the driest time of the day; the operator taking that part of each cock which was the top, and with it forming the base of a new one; so that the part which was most exposed to the air becomes excluded from it, and that which was undermost comes to be placed upon the top, so as to make it all dry as equally as possible.

“ If the hay has not been damp when it was first put up, the cock may be immediately finished out at once; but if it is at all wet, it will be of great use to turn over only a little of the top of the cock at first, and leaving it in that state to dry a little, proceed to another, and a third, and fourth, &c. treating each in the same way; going on in that manner till you find that the inside of the first opened cock is sufficiently dried, when it will be proper to return to it, turning over a little more of it till you come to what is still damp, when you leave it and proceed to another, and so on round the whole; always returning afresh till the cocks are entirely finished. This is the best way of saving your hay, if you have been under the necessity of cutting it while damp; but it is always best to guard against this inconvenience, if possible.”

204
Hay-stacks.

In the yard, a stack of hay ought to be an oblong square, if the quantity be greater than to be easily stowed in a round stack; because a smaller surface is exposed to the air, than in a number of round stacks. For the same reason, a stack of pease ought to have the same form, the straw being more valuable than that of oats, wheat, or barley. The moment a stack is finished, it ought to be covered; because the surface-hay is much damaged by withering in dry weather, and moistening in wet weather. Let it have a pavilion-roof; for more of it can be covered with straw in that shape, than when built perpendicular at the ends. Let it be roped as directed above for corn-stacks; with this difference only, that in an oblong square the ropes must be thrown over the top, and tied to the belt-rope below. This belt-rope ought to be fixed with pins to the stack: the reason is, that the ropes thrown over the stack will bag by the sinking of the stack, and may be drawn tight by lowering the belt-rope, and fixing it in its new position with the same pins.

The stems of hops, being long and tough, make excellent ropes; and it will be a saving article, to propagate a few plants of that kind for that very end.

A stack of rye-grass hay, a year old, and of a moderate size, will weigh, each cubic yard, 11 Dutch stone.

A stack of clover-hay in the same circumstances weighs somewhat less.

Practice.

SECT. VII. *Manures.*

THE manures commonly used are dung, lime, shell-marl, clay-marl, and stone-marl. Many other substances are used; shavings of horn, for example, refuse of malt, and even old rags: but as the quantity that can be procured is inconsiderable, and as their application is simple, we shall consume no time upon them.

Dung is the chief of all manures; because a quantity of it may be collected in every farm, and because it makes the quickest return. A field sufficiently dunged will produce good crops four or five years.

Dung of animals that chew the cud, being more thoroughly putrefied than that of others, is fit to be mixed with the soil without needing to be collected into a dunghill. A horse does not chew the cud; and in horse-dung may be perceived straw or rye-grass broken into small parts, but not dissolved: it is proper therefore that the putrefaction be completed in a dunghill. It ought to be mixed there with cool materials: so hot it is, that, in a dunghill by itself, it fuses and burns instead of putrefying. The difference between the dung of a horse and of a horned animal, is visible in a pasture-field: the grass round the former is withered; round the latter, it is ranker and more verdant than in the rest of the field. A mixture of dry and moist stuff ought to be studied: the former attracting moisture from the latter, they become equally moist.

205
Dung.

To prevent sap from running out of a dunghill, its situation should be a little below the surface; and to prevent rain from running into it, it should be surrounded with a ring of sod. If the soil on which the dunghill stands be porous, let it be paved, to prevent the sap from sinking into the ground. If moisture happen to superabound, it may be led off by a small gutter to impregnate a quantity of rich mould laid down to receive it, which will make it equal to good dung.

206
Of a dung-hill.

Straw should be prepared for the dunghill, by being laid under cattle, and sufficiently moistened. When laid dry into a dunghill, it keeps it open, admits too much air, and prevents putrefaction.

Dung from the stable ought to be carefully spread on the dunghill, and mixed with the former dung. When left in heaps upon the dunghill, fermentation and putrefaction go on unequally.

Complete putrefaction is of importance with regard to the seed of weeds that are in the dunghill: if they remain sound, they are carried out with the dung, and infest the ground. Complete putrefaction is of still greater importance by pulverizing the dung; in which condition it mixes intimately with the soil, and operates the most powerfully. In land intended for barley, undigested dung has a very bad effect: it keeps the ground open, admits drought, and prevents the seed from springing. On the other hand, when thoroughly rotted, it mixes with the soil, and enables it to retain moisture. It follows, that the properest time for dunging a field,

is

(A) By *winning* hay, is meant the operation by which it is brought from the succulent state of grass to that of a dry fodder.

^{Practice.} is in its highest pulverization; at which time the earth mixes intimately with the dung. Immediately before setting cabbage, sowing turnip, or wheat, is a good time. ²⁰⁷ Time for dunging. Dung divides and spreads the most accurately when moist. Its intimate mixture with the soil is of such importance, that hands should be employed to divide and spread any lumps that may be in it.

²⁰⁸ Manner of dunging. Dung should be spread, and ploughed into the ground without delay. When a heap lies two or three weeks, some of the moisture is imbibed into the ground, which will produce tufts of corn more vigorous than in the rest of the field. There cannot be a worse practice than to lead out dung before winter, leaving it exposed to frost and snow. The whole spirit of the dung is extracted by rain, and carried off with it. The dung divested of its sap becomes dry in spring, and incapable of being mixed with the mould. It is turned over whole by the plough, and buried in the furrow.

²⁰⁹ Of collecting dung. As dung is an article of the utmost importance in husbandry, one should imagine, that the collecting it would be a capital article with an industrious farmer. Yet an ingenious writer, observing that the Jamaicans are in this particular much more industrious than the British, ascribes the difference to the difficulty of procuring dung in Jamaica. "In England, where the long winter enables a farmer to raise what quantity he pleases, it is not collected with any degree of industry. But in Jamaica, where there is no winter, and where the heat of the sun is a great obstruction, the farmer must be indefatigable, or he will never raise any dung." Cool interest is not alone a sufficient motive with the indolent, to be active. As dung is of great importance in husbandry, a farmer cannot be too assiduous in collecting animal and vegetable substances that will rot. One article of that kind there is, to collect which there is a double motive, and yet is neglected almost every where. A farm full of weeds is a nuisance to the neighbourhood: it poisons the fields around; and the possessor ought to be disgraced as a pest to society. Now the cutting down every weed before the seed is formed, answers two excellent purposes. First, it encourages good crops, by keeping the ground clean. Next, these weeds mixed with other materials in a dunghill, may add considerably to the quantity of dung.

²¹⁰ Of lime. Next of lime, which is a profitable manure, and greatly so when it can be got in plenty within a moderate distance. The benefit of lime is so visible, that the use of it has become general, where the price and carriage are in any degree moderate.

²¹¹ Its operation. However people may differ in other particulars, all agree, that the operation of lime depends on its intimate mixture with the soil; and therefore that the proper time of applying it, is when it is perfectly powdered and the soil at the same time in the highest degree of pulverization. Lime of itself is absolutely barren; and yet it enriches a barren soil. Neither of the two produces any good effect without the other: and consequently, the more intimately they are mixed, the effect must be the greater.

Hence it follows, that lime ought always to be slaked with a proper quantity of water, because by that means it is reduced the most effectually into powder. Lime left to be slaked by a moist air, or accidental rain, is seldom or never thoroughly reduced into powder;

and therefore can never be intimately mixed with the soil. Sometimes an opportunity offers to bring home shell-lime before the ground is ready for it; and it is commonly thrown into a heap without cover, trusting to rain for slaking. The proper way is, to lay the shell-lime in different heaps on the ground where it is to be spread, to reduce these heaps into powder by slaking with water, and to cover the slaked lime with sod so as to defend it from rain. One however would avoid as much as possible the bringing home lime before the ground be ready for it. Where allowed to lie long in a heap, there are two bad consequences: first, lime attracts moisture, even though well covered, and runs into clots, which prevents an intimate mixture; and, next, we know, that burnt limestone, whether in shells or in powder, returns gradually into its original state of limestone; and upon that account also, is less capable of being mixed with the soil. And this is verified by a fact, that, after lying long, it is so hard bound together as to require a pick to separate the parts.

For the same reason, it is a bad practice, though common, to let spread lime lie on the surface all winter. The bad effects above mentioned take place here in part: and there is another; that rain washes the lime down to the furrows, and in a hanging field carries the whole away.

As the particles of powdered lime are both small and heavy, they quickly sink to the bottom of the furrow, if care be not taken to prevent it. In that view, it is a rule, that lime be spread, and mixed with the soil, immediately before sowing, or along with the seed. In this manner of application, there being no occasion to move it till the ground be stirred for a new crop, it has time to incorporate with the soil, and does not readily separate from it. Thus, if turnip-feed is to be sown broadcast, the lime ought to be laid on immediately before sowing, and harrowed in with the feed. If a crop of drilled turnip or cabbage be intended, the lime ought to be spread immediately before forming in drills. With respect to wheat, the lime ought to be spread immediately before seed-furrowing. If spread more early, before the ground be sufficiently broken, it sinks to the bottom. If a light soil be prepared for barley, the lime ought to be spread after seed-furrowing, and harrowed in with the feed. In a strong soil, it sinks not so readily to the bottom; and therefore, before sowing the barley, the lime ought to be mixed with the soil by a brake. Where moor is summer-fallowed for a crop of oats next year, the lime ought to be laid on immediately before the last ploughing, and braked in as before. It has sufficient time to incorporate with the soil before the land be stirred again.

The quantity to be laid on depends on the nature of the soil. Upon a strong soil, 70 or 80 bolls of shells are not more than sufficient, reckoning four small firlots to the boll, termed *wheat-measure*; nor will it be an overdose to lay on 100 bolls. Between 50 and 60 may suffice upon medium soils; and upon the thin or gravelly, between 30 and 40. It is not safe to lay a much greater quantity on such soils.

It is common to lime a pasture-field immediately before ploughing. This is an unsafe practice; it is thrown to the bottom of the furrow, from which it is never fully gathered up. The proper time for liming

Practice. a pasture field, intended to be taken up for corn, is a year at least, or two, before ploughing. It is washed in by rain among the roots of plants, and has time to incorporate with the soil.

215
Beat lime-
stone.
Limestone beat small makes an excellent manure; and supplies the want of powdered lime where there is no fuel to burn the limestone. Limestone beat small has not hitherto been much used as a manure; and the proportion between it and powdered lime has not been ascertained. What follows may give some light. Three pounds of raw lime is by burning reduced to two pounds of shell-lime. Yet nothing is expelled by the fire but the air that was in the limestone: the calcareous earth remains entire. *Ergo*, two pounds of shell-lime contain as much calcareous earth as three pounds of raw limestone. Shell-lime of the best quality, when flaked with water, will measure out to thrice the quantity. But as limestone loses none of its bulk by being burnt into shells, it follows, that three bushels of raw limestone contain as much calcareous earth as six bushels of powdered lime; and consequently, if powdered lime possess not some virtue above raw limestone, three bushels of the latter beat small should equal as a manure six bushels of the former.

216
Of shell-
marl.
Shell-marl, as a manure, is managed in every respect like powdered lime; with this only difference, that a fifth or a fourth part more in measure ought to be given. The reason is, that shell-marl is less weighty than lime; and that a boll of it contains less calcareous earth, which is the fructifying part of both.

Clay and stone marls, with respect to husbandry, are the same, though in appearance different.

217
Of clay
and stone-
marls.
The goodness of marl depends on the quantity of calcareous earth in it: which has been known to amount to a half or more. It is too expensive if the quantity be less than a third or a fourth part. Good marl is the most substantial of all manures; because it improves the weakest ground to equal the best borough-acres. The low part of Berwickshire termed *the Merse*, abounds every where with this marl; and is the only county in Scotland where it is plenty.

Land ought to be cleared of weeds before marling; and it ought to be smoothed with the brake and harrow, in order that the marl may be equally spread. Marl is a fossil on which no vegetable will grow; its efficacy depends, like that of lime, on its pulverization, and intimate mixture with the soil. Toward the former, alternate drought and moisture contribute greatly, as also frost. Therefore, after being evenly spread, it ought to lie on the surface all winter. In the month of October it may be roused with a brake; which will bring to the surface, and expose to the air and frost, all the hard parts, and mix with the soil all that is powdered. In that respect it differs widely from dung and lime, which ought to be ploughed into the ground without delay. Oats is a hardy grain, which will answer for being the first crop after marling better than any other; and it will succeed though the marl be not thoroughly mixed with the soil. In that case, the marl ought to be ploughed in with an ebb furrow immediately before sowing, and braked thoroughly. It is ticklish to make wheat the first crop: if sown before winter, frost swells the marl, and is apt to throw the seed out of the ground; if sown in spring, it will suffer more than oats by want of due mixture.

Summer is the proper season for marling; because in that season the marl, being dry, is not only lighter, but is easily reduced to powder. Frost however is not improper for marling, especially as in frost there is little opportunity for any other work.

Marl is a heavy body, and sinks to the bottom of the furrow, if indiscreetly ploughed. Therefore the first crop should always have an ebb furrow. During the growing of that crop, the marl has time to incorporate with the soil, and to become a part of it; after which it does not readily separate.

SECT. VIII. Principles and Operations of the New- or Horse-hoeing Husbandry.

THE general properties attributed to the new husbandry may be reduced to two, viz. the promoting the growth of plants by hoeing, and the saving of seed; both of which are equally profitable to the farmer.

The advantages of tillage before sowing have already been pointed out. In this place we must confine ourselves to the utility of tillage after sowing. This kind of tillage is most generally known by the name of *horse-hoeings*.

Land sowed with wheat, however well it may be cultivated in autumn, sinks in the winter; the particles get nearer together, and the weeds rise; so that in spring, the land is nearly in the same situation as if it never had been ploughed. This, however, is the season when it should branch and grow with most vigour; and consequently stands most in need of ploughing or hoeing, to destroy the weeds, to supply the roots with fresh earth, and, by dividing anew the particles of the soil, to allow the roots to extend and collect nourishment.

It is well known, that, in gardens, plants grow with double vigour after being hoed or transplanted. If plants growing in arable land could be managed with ease and safety in this manner, it is natural to expect, that their growth would be promoted accordingly. Experience shows, that this is not only practicable, but attended with many advantages.

In the operation of hoeing wheat, though some of the roots be moved or broken, the plants receive no injury; for this very circumstance makes them send forth a greater number of roots than formerly, which enlarge their pasture, and consequently augment their growth.

Sickly wheat has often recovered its vigour after a good hoeing, especially when performed in weather not very hot or dry.

Wheat, and such grain as is sown before winter, requires hoeing more than oats, barley, or other grain sown in the spring; for, if the land has been well ploughed before the sowing of spring-corn, it neither has time to harden, nor to produce many weeds, not having been exposed to the winter's snow and rain.

OF SOWING.

As, in the practice of the New Husbandry, plants grow with greater vigour than by the old method, the land should be sowed thinner. It is this principle of the new husbandry that has been chiefly objected to; for, upon observing the land occupied by a small number of plants, people are apt to look upon all the vacant

Practice.

218-
Advanta-
ges ascribed
to horse-
hoeing.219
Method of
sowing in
the New
Husbandry

cant

Practice. cant space as lost. But this prejudice will soon be removed, when it is considered, that, in the best land cultivated in the common method, and sown very thick, each seed produces but one or two ears; that, in the same land sown thinner, every seed produces two or three ears; and that a single seed sometimes produces 18 or 21 ears.

In the common method, as there are many more plants than can find sufficient nourishment, and as it is impossible to assist them by hoeing, numbers die before they attain maturity, the greatest part remain sickly and drooping; and thus part of the seed is lost. On the contrary, in the new method, all the plants have as much food as they require; and as they are, from time to time, assisted by hoeing, they become so vigorous as to equal in their production the numerous but sickly plants cultivated in the common method.

OF HOEING.

THE new husbandry is absolutely impracticable in lands that are not easily ploughed. Attempting to cultivate land according to this husbandry, without attending to this circumstance, that it is practicable in no land excepting such as have already been brought into good tilth by the old method, has gone far to make it contemptible in many places.

220
The different hoeings.

When a field is in good tilth, it should be sown so thin as to leave sufficient room for the plants to extend their roots. After being well ploughed and harrowed, it must be divided into rows, at the distance of thirty inches from one another. On the sides of each of these rows, two rows of wheat must be sowed six inches distant from each other. By this means there will be an interval of two feet wide betwixt the rows, and every plant will have room enough to extend its roots, and to supply it with food. The intervals will likewise be sufficient for allowing the earth to be hoed or tilled without injuring the plants in the rows.

The first hoeing, which should be given before the winter, is intended to drain away the wet, and to dispose the earth to be mellowed by the frosts. These two ends will be answered by drawing two small furrows at a little distance from the rows, and throwing the earth taken from the furrows into the middle of the intervals. This first hoeing should be given when the wheat is in leaf.

The second hoeing, which is intended to make the plants branch, should be given after the hard frosts are over. To do this with advantage, after stirring the earth a little near the rows, the earth which was thrown in the middle of the intervals should be turned back into the furrows. This earth, having been mellowed by the winter, supplies the plants with excellent food, and makes the roots extend.

The third hoeing, which is intended to invigorate the stalk, should be given when the ears of the corn begin to show themselves. This hoeing may, however, be very slight.

But the last hoeing is of the greatest importance, as it enlarges the grain, and makes the ears fill at their extremities. This hoeing should be given when the wheat is in bloom; a furrow must be drawn in the middle of the interval, and the earth thrown to the right and left on the foot of the plants. This supports the plants, prevents them from being laid, and pre-

Practice. pares the ground for the next sowing, as the seed is then to be put in the middle of the ground that formed the intervals.

The best season for hoeing is two or three days after rain, or so soon after rain as the soil will quit the instrument in hoeing. Light dry soils may be hoed almost any time, but this is far from being the case with strong clay soils; the season for hoeing such is frequently short and precarious; every opportunity therefore should be carefully watched, and eagerly embraced. The two extremes of wet and dry, are great enemies to vegetation in strong clay soils. There is a period between the time of clay soils running together, so as to puddle by superfluous wet, and the time of their caking by drought, that they are as tractable as need be. This is the juncture for hoeing; and so much land as shall be thus seasonably hoed, will not cake or crust upon the surface, as it otherwise would have done, till it has been soaked or drenched again with rain; in which case the hoeing is to be repeated as soon as the soil will quit the instrument, and as often as necessary; by which time the growing crop will begin to cover the ground, so as to act as a screen to the surface of the land against the intense heat of the sun, and thereby prevent, in great measure, the bad effects of the soil's caking in dry weather.

By this successive tillage, or hoeing, good crops will be obtained, provided the weather is not very unfavourable.

But as strong, vigorous plants are longer before they arrive at maturity, corn raised in the new way is later in ripening than any other, and must therefore be sown earlier.

In order to prepare the intervals for sowing again, some well-rooted dung may be laid in the deep furrows made in the middle of the intervals; and this dung must be covered with the earth that was before thrown towards the rows of wheat. But, if the land does not require mending, the deep furrow is filled without any dung. This operation should be performed immediately after harvest, that there may be time to give the land a slight stirring before the rows are sowed; which should occupy the middle of the space which formed the intervals during the last crop. The intervals of the second year take up the space occupied by the stubble of the first.

Supposing dung to be necessary, which is denied by many, a very small quantity is sufficient; a single layer, put in the bottom of each furrow, will be enough.

DESCRIPTION of the INSTRUMENTS commonly used in the NEW HUSBANDRY.

221
Fig. 1. is a marking plough. The principal use of instruments this plough is to straighten and regulate the ridges. The described. first line is traced by the eye, by means of three poles, Plate VII: placed in a straight line. The plough draws the first furrow in the direction of this line; and, at the same time, with the tooth A, fixed in the block of wood near the end of the cross-pole or slider B B, marks the breadth of the ridge at the distance intended. The ploughman next traces the second line or rutt made by the tooth, and draws a small furrow along it; and continues in this manner till the whole field is laid out in straight and equidistant ridges.

Fig.

Practice.

Plate VII.

Fig. 2. is a plough for breaking up lee, or turning up the bottom of land when greatly exhausted. By its construction, the width and depth of the furrows can be regulated to a greater certainty than by any other hitherto known in this country. Its appearance is heavy; but two horses are sufficient to plough with it in ordinary free land; and only four are necessary in the stiffest clay-foils. This plough is likewise easily held and tempered. A, is the sword fixed in the sizers B, which runs thro' a mortoise E, at the end of the beam C, and regulates the depth of the furrow by raising or depressing the beam; it is fixed by putting the pin D thro' the beam and sword, and is moveable at E.

Fig. 3. is a jointed brake-harrow with 24 teeth, shaped like coulter, and standing at about an angle of 80 degrees. By this instrument the land is finely pulverized, and prepared for receiving the seed from the drill. It requires four horses in stiff, and two in open, land. This harrow is likewise used for levelling the ridges; which is done by pressing it down by the handles where the ridge is high, and raising it up when low.

Fig. 4. is an angular weeding harrow, which may follow the brake when necessary. The seven hindmost teeth should stand at a more acute angle than the rest, in order to collect the weeds, which the holder can drop at pleasure, by raising the hinder part, which is fixed to the body of the harrow by two joints.

Fig. 5. is a pair of harrows with shafts. This harrow is used for covering the seed in the drills, the horse going in the furrow.

Fig. 6. is a drill-plough, constructed in such a manner as to sow at once two rows of beans, pease, or wheat. This machine is easily wrought by two horses. A, is the happer for containing the seed; B, circular boxes for receiving the seed from the happer; CC, two square boxes which receive the seed from small holes in the circular boxes, as they turn round; and last of all, the seed is dropped into the drills through holes in the square boxes, behind the coulter D. The cylinder E follows, which, together with the wheel F, regulates the depth of the coulter, and covers the seed; the harrow G comes behind all, and covers the seed more completely. H H, two sliders, which, when drawn out, prevent the seed from falling into the boxes; and I, is a ketch which holds the rungs, and prevents the boxes from turning, and losing seed at the ends of the ridges.

Fig. 7. is a single hoe-plough of a very simple construction, by which the earth in the intervals is stirred and laid up on both sides to the roots of the plants, and at the same time the weeds are destroyed. A A the mould-boards, which may be raised or depressed at pleasure, according as the farmer wants to throw the earth higher or lower upon the roots.

Plate VI.

Fig. 2. is a drill-rake for pease. This instrument, which is chiefly calculated for small inclosures of light grounds, is a sort of strong plough rake, with four large teeth at *a, a, b, b*, a little incurvated. The distance from *a* to *a*, and from *b* to *b*, is nine inches. The interval between the two inner teeth, *a* and *b*, is three feet six inches, which allows sufficient room for the hole-plough to move in. To the piece of timber *cc*, forming the head of the rake, are fixed the handles *d*, and the beam *e*, to which the horse is fastened. When this instrument is drawn over a piece of land made thoroughly fine,

and the man who holds it bears upon the handles, four furrows, *f, g, h, i*, will be formed, at the distances determined by the construction of the instrument. These distances may be accurately preserved, provided that the teeth *a a* return when the ploughman comes back, after having ploughed one turn, in two of the channels formed before, marked *b b*: thus all the furrows in the field will be traced with the same regularity. When the ground is thus formed into drills, the pease may be scattered by a single motion of the hand at a certain distance from one another into the channels, and then covered with the flat part of a hand-rake, and pressed down gently. This instrument is so simple, that any workman may easily make or repair it.

On 2d Plate VII. is delineated a patent drill machine, lately invented by the Reverend James Cooke of Heaton-Norris near Manchester. A, the upper part of the seed-box. B, the lower part of the same box. C, a moveable partition, with a lever, by which the grain or seed is let fall at pleasure from the upper to the lower part of the seed-box, from whence it is taken up by cups or ladles applied to the cylinder D, and dropped into the funnel E, and conveyed thereby into the furrow or drill made in the land by the coulter F, and covered by the rake or harrow G. H, a lever, by which the wheel I is lifted out of gear with the wheel K, to prevent the grain or seed being scattered upon the ground, while the machine is turning round at the end of the land, by which the harrow G is also lifted from the ground at the same time, and by the same motion, by means of the crank, and the horizontal lever *b b*. L, a sliding lever, with a weight upon it, by means of which, the depth of the furrows or drills, and consequently the depth that the grain or seed will be deposited in the land, may be easily ascertained. M, a screw in the coulter beam, by turning of which, the seed-box B is elevated or depressed, in order to prevent the grain or seed being crushed or bruised by the revolution of the cups or ladles. Fig. 13. a rake with iron teeth, to be applied to the under side of the rails of the machine, with staples and screw nuts at *nn*, by which many useful purposes are answered, viz. in accumulating crotch or hay into rows, and as a scarifier for young crops of wheat in the spring, or to be used upon a fallow; in which case, the seed-box, the ladle cylinder, the coulter, the funnels, and harrows, are all taken away.

This side view of the machine is represented, for the sake of perspicuity, with one seed-box only, one coulter, one funnel, one harrow, &c. whereas a complete machine is furnished with five coulter, five harrows, seven funnels, a seed-box in eight partitions, &c. with ladles of different sizes, for different sorts of grain and seeds.

These machines, (with five coulter sixteen guineas, with four coulter fifteen guineas) equally excel in setting or planting all sorts of grain and seeds, even carrot seed, to exactness, after the rate of from eight to ten chain acres per day, with one man, a boy, and two horses. They deposit the grain or seed in any given quantity from one peck to three bushels per acre, regularly and uniformly, and that without grinding or bruising the seed, and at any given depth, from half an inch to half a dozen inches, in rows at the distance of twelve,

Practice.

Practice twelve, sixteen, and twenty-four inches, or any other distance. They are equally useful on all lands, are durable, easy to manage, and by no means subject to be put out of repair.

The ladle cylinder D is furnished with cups or ladles of four different sizes for different sorts of grain or seeds, which may be distinguished by the numbers 1, 2, 3, 4.—N^o 1. (the smallest size) is calculated for turnip-feed, clover-feed, cole-feed, rape, &c. and will sow something more than one pound per statute acre. N^o 2. for wheat, rye, hemp, flax, &c. and will sow something more than one bushel per acre. N^o 3. for barley; and will sow one bushel and a half per acre. N^o 4. for beans, oats, pease, vetches, &c. and will sow two bushels per acre.

Notwithstanding the above specified quantities of grain or seeds, a greater or less quantity of each may be sown at pleasure, by stopping up with a little clay, or by adding a few ladles to each respective box. The grain or seeds intended to be sown, must be put in those boxes, to which the cups or ladles as above described respectively belong, an equal quantity into each box, and all the other boxes empty. The ladle cylinder may be reversed, or turned end for end at pleasure, for different sorts of grain, &c.

For sowing beans, oats, pease, &c. with a five-coulter machine, four large ladles must occasionally be applied at equal distances round those parts of the cylinder which subtend the two end boxes. And for sowing barley, eight large ones must be applied as above; or four ladles, N^o 2. to each of the wheat boxes. These additional ladles are fixed on the cylinder with nails, or taken off in a few minutes; but for sowing with a four-coulter machine, the above alterations are not necessary.

The funnels are applied to their respective places by corresponding numbers. Care should be taken, that the points of the funnel stand directly behind the backs of the coulters, which is done by wedges being applied to one side or other of the coulters, at the time they are fixed in their respective places.

The machine being thus put together, which is readily and expeditiously done, as no separate part will coincide with any other but that to which it respectively belongs, and an equal quantity of grain or seed in each of the respective boxes, the land also being previously ploughed and harrowed once or so in a place to level the surface; but if the land be very rough, a roller will best answer that purpose, whenever the land is dry enough to admit of it; and upon strong clays, a spiked roller is sometimes necessary to reduce the size of the large dry clods; which being done, the driver should walk down the furrow or edge of the land, and having hold of the last horse's head with his hand, he will readily keep him in such a direction, as will bring the outside coulters of the machine within three or four inches of the edges of the land or ridge, at which uniform extent, he should keep his arm till he comes to the end of the land; where having turned round, he must come to the other side of his horses, and walking upon the last outside drill, having hold of the horse's head with his hand as before, he will readily keep the machine in such a direction, as will strike the succeeding drill at such a distance from the last outside one, or that he walks upon, as the coulters are distant from each other.

Practice. The person who attends the machine should put down the lever H soon enough at the end of the land, that the cups or ladles may have time to fill, before he begins to sow; and at the end of the land, he must apply his right hand to the middle of the rail between the handles, by which he will keep the coulters in the ground, while he is lifting up the lever H with his left hand, to prevent the grain being scattered upon the headland, while the machine is turning round; this he will do with great ease, by continuing his right hand upon the rail between the handles, and applying his left arm under the left handle, in order to lift the coulters out of the ground while the machine is turning round.

If there be any difficulty in using the machine, it consists in driving it straight. As to the person who attends the machine, he cannot possibly commit any errors, except such as are wilful, particularly as he sees at one view the whole process of the business, viz. that the coulters make the drills of a proper depth; that the funnels continue open to convey the grain or seed into the drills; that the rakes or harrows cover the grain sufficiently; and when seed is wanting in the lower boxes B, which he cannot avoid seeing, he readily supplies them from the upper boxes A, by applying his hand, as the machine goes along, to the lever C. The lower boxes B, should not be suffered to become empty before they are supplied with seed, but should be kept nearly full, or within an inch or so of the edge of the box.

If chalk lines are made across the backs of the coulters, at such a distance from the ends as the seed should be deposited in the ground (viz. about two inches for wheat, and from two to three for spring corn), the person that attends the machine will be better able to ascertain the depth the seed should be deposited in the drills, by observing, as the machine goes along, whether the chalk lines are above or below the surface of the land; if above, a proper weight must be applied to the lever L, which will force the coulters into the ground; if below, the lever L and weight must be reversed, which will prevent their sinking too deep.

In different parts of the kingdom, lands or ridges are of different sizes; where the machine is too wide for the land, one or more funnels may occasionally be stopped with a little loose paper, and the seed received into such funnel returned at the end of the land, or sooner if required, into the upper feed-box. But for regularity and expedition, lands consisting of so many feet wide from outside to outside, as the machine contains coulters, when fixed at twelve inches distance, or twice or three times the number, &c. are best calculated for the machine. In wet soils or strong clays, lands or ridges of the width of the machine, and in dry soils, of twice the width, are recommended. For sowing of narrow high-ridged lands, the outside coulters should be let down, and the middle ones raised, so that the points of the coulters may form the same curve that the land or ridge forms. And the loose soil harrowed down into the furrows should be returned to the edges of the lands or ridges from whence it came, by a double mould-board or other plough, whether the land be wet or dry.

Clover or other lays, intended to be sown by the machine,

Practice.

machine, should be ploughed a deep strong furrow and well harrowed, in order to level the surface, and to get as much loose soil as possible for the coulters to work in; and when sown, if any of the seed appears in the drills uncovered by reason of the stiff texture of the soil, or toughness of the roots, a light harrow may be taken over the land, once in a place, which will effectually cover the seed, without displacing it at all in the drills. For sowing lays, a considerable weight must be applied to the lever L, to force the coulters into the ground; and a set of wrought-iron coulters, well-steel-ed, and made sharp at the front edge and bottom, are recommended; they will pervade the soil more readily, consequently require less draught, and expedite business more than adequate to the additional expence.

For every half acre of land intended to be sown by the machine with the seed of that very valuable root, (carrot) one bushel of saw-duft, and one pound of carrot seed, should be provided; the saw-duft should be made dry, and sifted to take out all the lumps and chips, and divided into eight equal parts or heaps; the carrot-feed should likewise be dried, and well rubbed between the hands, to take off the beards, so that it will separate readily, and being divided into eight equal parts or heaps, one part of the carrot-feed must be well mixed with one part of the saw-duft, and so on, till all the parts of carrot-feed and saw-duft are well mixed and incorporated together; in which state it may be sown very regularly in drills at twelve inches distance, by the cups or ladles N^o 2. Carrot-feed resembling saw-duft very much in its size, roughness, weight, adhesion, &c. will remain mixed as above during the sowing; a ladle-full of saw-duft will, upon an average, contain three or four carrot-seeds, by which means the carrot-feed cannot be otherwise than regular in the drills. In attempting to deposit small seeds near the surface, it may so happen that some of the seeds may not be covered with soil; in which case, a light roller may be drawn over the land after the seed is sown, which will not only cover the seeds, but will also, by levelling the surface, prepare the land for an earlier hoeing than could otherwise have taken place.

It has always been found troublesome, sometimes impracticable, to sow any kind of grain or seeds (even broad-cast) in a high wind. This inconvenience is entirely obviated, by placing a screen of any kind of cloth, or a sack, supported by two uprights nailed to the sides of the machine, behind the funnels, which will prevent the grain or seed being blown out of its direction in falling from the ladles into the funnels. Small pipes of tin may also be put on to the ends of the funnels, to convey the grain or seed so near the surface of the land, that the highest wind shall not be able to interrupt its descent into the drills.

Respecting the use of the machine, it is frequently remarked by some people not conversant with the properties of matter and motion, that the soil will close after the coulters, before the seed is admitted into the drills. Whereas the very contrary is the case; for the velocity of the coulters in passing through the soil, is so much greater than the velocity with which the soil closes up the drills by its own spontaneous gravity, that the incisions or drills will be constantly open for three or four inches behind the coulters; by which means, it is morally impossible (if the points of the funnels

N^o 8.

stand directly behind the coulters) that the seed with the velocity it acquires in falling through the funnels, shall not be admitted into the drills. Practice.

Fig. 12. is a new constructed simple hand-hoe, by which one man will effectually hoe two chain acres per day, earthing up the soil at the same time to the rows of corn or pulse, so as to cause roots to issue from the first joint of the stem, above the surface of the land, which otherwise would never have existed. 2d Plate VII

This hoe is worked much in the same manner as a common Dutch hoe, or scuffle, is worked in gardens. The handle is elevated or depressed, to suit the size of the person that works it, by means of an iron wedge being respectively applied to the upper or under side of the handle that goes into the socket of the hoe.

The wings or moulding plates of the hoe, which are calculated to earth up the soil to the rows of corn, so as to cause roots to issue from the first joint of the stem above the surface, which otherwise would not have existed, should never be used for the first hoeing, but should always be used for the last hoeing, and used or not used, at the option of the farmer, when any intermediate hoeing is performed.

SUMMARY of the OPERATIONS necessary in executing the NEW HUSBANDRY with the PLOUGH.

1. It is indispensably necessary that the farmer be provided with a drill and hoe-plough. 222
Summary of
the opera-
tions.
2. The new husbandry may be begun either with the winter or spring corn.
3. The land must be prepared by four good ploughings, given at different times, from the beginning of April to the middle of September.
4. These ploughings must be done in dry weather, to prevent the earth from kneading.
5. The land must be harrowed in the same manner as if it were sowed in the common way.
6. The rows of wheat should be sowed very straight.
7. When the field is not very large, a line must be strained across it, by which a rill may be traced with a hoe for the horse that draws the drill to go in; and when the rows are sown, 50 inches must be left betwixt each rill. But, when the field is large, stakes at five feet distance from each other must be placed at the two ends. The workman must then trace a small furrow with a plough that has no mold-board, for the horse to go in that draws the drill, directing himself with his eye by the stakes.
8. The sowing should be finished at the end of September, or beginning of October.
9. The furrows must be traced the long way of the land, that as little ground as possible may be lost in headlands.
10. The rows, if it can be done, should run down the slope of the land, that the water may get the easier off.
11. The seed-wheat must be plunged into a tub of lime-water, and stirred, that the light corn may come to the surface and be skimmed off.
12. The seed must be next spread on a floor, and frequently stirred, till it is dry enough to run through the valves of the happer of the drill.
13. To prevent smut, the seed may be put into a ley of ashes and lime.

4

14. Good

Practice.

14. Good old feed-wheat should be chosen in preference to new, as it is found by experience not to be so subject to smut.

15. After the hoppers of the drill are filled, the horse must go slowly along the furrow that was traced. That a proper quantity of seed may be sown, the aperture of the happer must be suited to the size of the grain.

16. As the drill is seldom well managed at first, the field should be examined after the corn has come up, and the deficiencies be supplied.

17. Upon wet soils or strong clays, wheat should not be deposited more than two inches deep, on any account whatever; nor less than two inches deep on dry soils. From two to three inches is a medium depth for all spring corn. But the exact depth at which grain should be deposited in different soils, from the lightest sand to the strongest clay, is readily ascertained only by observing at what distance under the surface of the land, the secondary or coronal roots are formed in the spring.

18. Stiff lands, that retain the wet, must be stirred or hoed in October. This should be done by opening a furrow in the middle of the intervals, and afterwards filling it up by a furrow drawn on each side, which will raise the earth in the middle of the intervals, and leave two small furrows next the rows, for draining off the water, which is very hurtful to wheat in winter.

19. The next stirring must be given about the end of March, with a light plough. In this stirring the furrows made to drain the rows must be filled up by earth from the middle of the intervals.

20. Some time in May, the rows must be evened; which, though troublesome at first, soon becomes easy, as the weeds are soon kept under by tillage.

21. In June, just before the wheat is in bloom, another stirring must be given with the plough. A deep furrow must be made in the middle of the intervals, and the earth thrown upon the sides of the rows.

22. When the wheat is ripe, particular care must be taken, in reaping it, to trample as little as possible on the ploughed land.

23. Soon after the wheat is carried off the field, the intervals must be turned up with the plough, to prepare them for the seed. The great furrow in the middle must not only be filled, but the earth raised as much as possible in the middle of the intervals.

24. In September, the land must be again sowed with a drill, as above directed.

25. In October, the stubble must be turned in for forming the new intervals; and the same management must be observed as directed in the first year.

We pretend not to determine whether the old or new husbandry be preferable in every country. With regard to this point, the climate, the situation of particular land, skill and dexterity in managing the machinery, the comparative expence in raising crops, and many other circumstances, must be accurately attended to before a determination can be given.

The following comparative view of the old and new methods of culture, was furnished for the editors of Mr Tull's Horse-hoeing Husbandry, by a gentleman who for some years practised both in a country where the soil was light and chalky, like that from which he drew his ob-

VOL. I. Part I.

servations. It is necessary to remark, that in the new husbandry every article is stated at its full value, and the crop of each year is four bushels short of the other; though, in several years experience, it has equalled and generally exceeded those of the neighbourhood in the old way.

Practice.

“ An estimate of the expence and profit of 10 acres of land in 20 years.

I. In the old way.

	L.	s.	d.	L.	s.	d.
First year, for wheat, costs 33 l. 5s. viz.						
First ploughing, at 6s. per acre	3	0	0			
Second and third ditto, at 8s. per acre		4	0			
Manure, 30s. per acre	15	0	0			
				22	0	0
Two harrowings, and sowing, at 2s. 6d. per acre		1	5			
Seed, three bushels per acre, at 4s. per bushel		6	0			
Weeding, at 2s. per acre		1	0			
Reaping, binding, and carrying, at 6s. per acre		3	0			
				11	5	0
Second year, for barley, costs 11 l. 6s. 8d. viz.						
Once ploughing, at 6s. per acre		3	0			
Harrowing and sowing, at 1s. 6d. per acre		0	15			
Weeding, at 1s. per acre		0	10			
Seed, four bushels per acre, at 2s. per bushel		4	0			
Cutting, raking, and carrying, at 3s. 2d. per acre		1	11			
Grass-seeds, at 3s. per acre		1	10			
				11	6	8
				44	11	8
Third and fourth years, lying in grass, cost nothing: so that the expence of ten acres in four years comes to 44 l. 11 s. 8d. and in twenty years to				222	18	4
First years produce is half a load of wheat per acre, at 7l. 3s. 5d.						
Second years produce is two quarters of barley per acre, at 1l.		20	0			
Third and fourth years grass is valued at 1l. 10s. per acre		15	0			
So that the produce of ten acres in four years is		70	0			
And in twenty years it will be				350	0	0
Deduct the expence, and there remains clear profit on ten acres in twenty years by the old way				127	1	8

223
Comparative view of the expence and profits of the Old and New Husbandry.

II. In the new way.

First year's extraordinary expence is, for ploughing and manuring the land, the same as in the old way L. 22 0 0

S f

Ploughing

Practice.	L.	s.	d.	L.	s.	d.
Ploughing once more, at 4s. per acre -	2	0	0			
Seed, nine gallons per acre, at 4s. per bushel -	2	5	0			
Drilling, at 7d. per acre -	0	5	10			
Hand-hoeing and weeding, at 2s. 6d. per acre -	1	5	0			
Horfe-hoeing six times, at 10s. per acre -	5	0	0			
Reaping, binding, and carrying, at 6s. per acre -	3	0	0			
The standing annual charge on ten acres is	13	15	10			
<hr/>						
Therefore the expence on ten acres in twenty years is				275	16	8
Add the extraordinaries of the first year, and the sum is				297	16	8
<hr/>						
The yearly produce is at least two quarters of wheat per acre, at 11. 8s. per quarter; which, on ten acres in twenty years, amounts to				560	0	0
<hr/>						
Therefore, all things paid, there remains clear profit on ten acres in twenty years by the new way				262	3	4
<hr/>						

224
Arguments in favour of the New Method.

“So that the profit on ten acres of land* in twenty years, in the new way, exceeds that in the old by L. 135 : 1 : 8, and consequently is considerably more than double thereof; an ample encouragement to practise a scheme, whereby so great advantage will arise from so small a quantity of land, in the compass of a twenty-one years lease; one year being allowed, both in the old and new way, for preparing the ground.

“It ought withal to be observed, that Mr Tull’s husbandry requires no manure at all, though we have here, to prevent objections, allowed the charge thereof for the first year; and moreover, that though the crop of wheat from the drill-plough is here put only at two quarters on an acre, yet Mr Tull himself, by actual experiment and measure, found the produce of his drilled wheat-crop amounted to almost four quarters on an acre.”

It appears also from a comparative calculation of expence and profit between the drill and common husbandry, taken from Mr Baker’s report to the Dublin Society of his experiments in agriculture for the year 1765, that there is a clear profit arising upon an Irish acre of land in 15 years in the drill husbandry of L. 52 : 3 : 10, and in the common husbandry of L. 27 : 19 : 2; and therefore a greater profit in the drilled acre in this time of L. 24 : 4 : 9, which amounts to L. 1 : 12 : 3½ per annum. From hence he infers, that in every 15 years the fee-simple of all the tillage-lands of the kingdom is lost to the community by the common course of tillage. In stating the accounts, from which their result is obtained, no notice is taken of fences, water-cutting the land, weeding and reaping, because these articles depend on a variety of circumstances, and will, in general, exceed in the common husbandry those incurred by the other.

Besides, the certainty of a crop is greater in this new way than in the old way of sowing; for most of the

accidents attending wheat crops, are owing to their being late sown, which is necessary to the farmer in the old way; but in the horfe-hoeing method the farmer may plough two furrows whereon the next crop is to stand immediately after the first crop is off. In this manner of husbandry, the land may be ploughed dry and drilled wet, without any inconvenience; and the seed is never planted under the furrow, but placed just at the depth which is most proper, that is, at about two inches; in which case it is easy to preserve it, and there is no danger of burying it. Thus the seed has all the advantage of early sowing, and none of the disadvantages that may attend it in the other way, and the crop is much more certain than by any other means that can be used.

The condition in which the land is left after the crop, is no less in favour of the horfe-hoeing husbandry than all the other articles. The number of plants is the great principle of the exhausting of land. In the common husbandry, the number is vastly greater than in the drilling way, and three plants in four often come to nothing, after having exhausted the ground as much as profitable plants; and the weeds which live to the time of harvest in the common way, exhaust the land no less than so many plants of corn, often much more. The horfe-hoeing method destroys all the weeds in the far greater part of the land, and leaves that part unexhausted and perfectly fresh for another crop. The wheat plants being also but a third part of the number at the utmost of those in the sowing way, the land is so much the less exhausted by them; and it is very evident from the whole, that it must be, as experience proves that it is, left in a much better condition after this than after the common husbandry.

The farmers who are against this method object, that it makes the plants too strong, and that they are more liable to the blacks or blights of insects for that reason; but as this allows that the hoeing can, without the use of dung, give too much nourishment, it is very plain that it can give enough; and it is the farmer’s fault if he do not proportion his pains so as to have the advantage of the nourishment without the disadvantages. It is also objected, that as hoeing can make poor land rich enough to bear good crops of wheat, it may make good land too rich for it. But if this should happen, the sowing of wheat on it may be let alone a while, and in the place of it the farmer may have a crop of turnips, carrots, cabbages, and the like, which are excellent food for cattle, and cannot be over-nourished: or, if this is not chosen, the land, when thus made too rich, may soon be sufficiently impoverished by sowing corn upon it in the common old way.

The method of horfe-hoeing husbandry, so strongly recommended by Mr Tull, is objected to by many on account of the largeness of the intervals which are to be left behind the rows of corn. These are required to be about five feet wide; and it is thought that such wide spaces are so much lost earth, and that the crop is to be so much the less for it. But it is to be observed, that the rows of corn separated by these intervals need not be single; they may be double, triple, or quadruple, at the pleasure of the farmer; and four rows thus standing as one will have the five foot interval but one-fourth of its bigness as to the whole quantity, and it will be but as fifteen inch intervals to plants

Practice.

225
Objections and answers.

in

Practice. in single rows. Corn that is sown irregularly in the common way, seems indeed to cover the ground better than that in rows: but this is a mere *deceptio visus*; for the stalks of corn are never so thick as when they come out of one plant, or as when they stand in a row; and a horse-hoed plant of corn will have 20 or 30 stalks in a piece of ground of the same quantity, where an unhoed plant will have only two or three stalks. If these stalks of the hoed plant were separated and planted over the intervals, the whole land would be better covered than it is in the common way; and the truth is, that though these hoed fields seem to contain a much less crop than the common sown fields, yet they in reality do contain a much greater. It is only the different placing that makes the sown crop seem the larger, and even this is only while both crops are young.

The intervals are not lost ground, as is usually supposed, but when well horse-hoed they are all employed in the nourishment of the crop; the roots of the plants in the adjoining rows spreading themselves thro' the whole interval, and drawing such nourishment from it, that they increase accordingly. When the plants stand in the scattered way, as in common sowing, they are too close to one another; each robs its neighbours of part of their nourishment, and consequently the earth is soon exhausted, and all the plants half starved. The close standing of them also prevents the benefit of after-tilling, as the hoe cannot be brought in, nor the ground by any means stirred between them to give it a new breaking, and consequently afford them new food.

Experiments have abundantly proved, that in large grounds of wheat where the different methods have been tried, those parts where the intervals were largest have produced the greatest crops, and those where hoeing was used without dung have been much richer than those where dung was used without hoeing. If it were possible that plants could stand as thick, and thrive as well over the whole surface of the ground, as they do in the rows separated by these large intervals, the crops of corn so produced would be vastly greater than any that have been heard of; but the truth is, that plants receive their growth not according to the ground they stand on, but to the ground they can extend their roots into; and therefore a single row may contain more plants than a large interval can nourish, and therefore the same number that stand in that row, and no more than these, could be nourished, if scattered over the whole interval; and they would be much worse nourished in that way; because while the interval is void, the earth may be stirred about them, and new roots will be formed in great numbers from every one broken by the instruments, and new nourishment laid before these roots by the breaking the particles of earth, by which the plants will have supplies that they cannot have when scattered over the whole surface, because the ground is then all occupied, and cannot be moved between the plants.

226
In what
circum-
stance the
new meth-
od is less
proper.

All soils and all situations are not equally proper for this method of planting in rows, with large intervals and hoeing between. The lightest soils seem to be best for it, and the tough and wet clays the worst. Such grounds as lie on the sides of hills are also less proper than others for this work.

This method is not so proper in common fields, but

that not in respect of the soil, but of the husbandry of the owners, who are usually in the old way, and change the species of corn, and make it necessary to fallow every second, third or fourth year. Nevertheless it has been found by later experiments, that the intervals betwixt the rows of plants, as recommended by Mr Tull, were too great, perhaps double of what they should be in the most profitable method of culture; by which means much less crops are obtained than might be produced at nearly the same expence. This has rendered the profits of the drill method much less than they would have been in a more judicious practice, and, consequently, has proved a great disadvantage to it in comparison with the broad-cast. Mr Tull was led into this, partly from the want of more perfect instruments for hoeing, and of ploughs proper for drilling.

To the preceding statements, the following observations by Sir John Anstruther, published among the Select Papers of the Bath Society, may not be improperly subjoined.

The slow progress which the Drill-husbandry has made in many parts of Great Britain since Mr Tull's time, he observes, has been principally owing to the want of proper drill-ploughs. Before drilling can become general, those ploughs must be simple, such as a common ploughman accustomed to use strong instruments can use without breaking, and such also as common workmen can easily make or repair. Mathematical accuracy he considers as not required for delivering the seed: for it matters very little whether there be a quarter of a peck more or less sown, if it be delivered with tolerable regularity. He therefore had a plough made, according to his own directions, by a common plough-wright, of sufficient strength for any land made fit for turnips or wheat. It was tried on very rough ground unfit for sowing, in order to ascertain its strength; and it had been used for eight years without its needing any repair. It is a double drill-plough, which sows two ridges at a time, the horse going in the furrow between them, and of course does not tread upon the ground intended to be sown; which with a single drill must be the case, and does much harm by the horses feet sinking and making holes in the fine ground, which retain the water, and hurt the wheat when young.

He proceeds to observe, "That having read Mr Forbes upon the extensive practice of the new husbandry, and some other authors, who gave a more clear and distinct account of the different operations in drilling than had heretofore been given, I wished to try them, and to adapt my plough to sow the quantities therein directed. It was, however, adjusted to sow a smaller quantity, and the seed was not steeped.

"Not having ground so proper as I wished, it was drilled on the side of a field, the soil of which was light and sandy, and in such bad order, that the preceding crop was a very indifferent one. It was therefore manured with a compost dung-hill.

"After cross-ploughing and manuring, it was laid into four and a half feet ridges, then harrowed and drilled with one peck and a half of wheat on an acre and a quarter, which is nearly one peck and a fifth per English acre. It was drilled the 27th of October, and rolled after drilling. The crop was late in its appearance, and very backward in the spring.

S f 2

" March

Practice.

227
Observa-
tions by Sir
John An-
struther.

Practice.

Practice.

“ March 31st, it was horse-hoed one furrow *from* the rows.

“ April 8th, it was hand-hoed and weeded in the rows.

“ 25th, horse-hoed again, laying a furrow back *to* the rows.

“ May 15th, hand-hoed the second time.

“ June 1st, horse-hoed *from* the rows.

“ June 12th, hand-hoed the third time.

“ July 14th, horse-hoed *to* the rows.

“ At this last hoeing, as many of the ears were beaten down into the intervals by wind and rain, a man went before the horse-hoe, and turned the ears back into their proper place.

“ The crop, when reaped and threshed, yielded me 36 bushels on one acre and a quarter, which is 28 bushels and three pecks per acre; and the produce from one peck and half 96 for one.

“ As the produce appeared so great, from land in such bad order, it was carefully measured again, and found to be right. But this increase, though great, was not so large as Mr Crake of Glasgow had without dung.

“ Mr Randal says, ‘It is an experimented fact, that on a fine loam exquisitely prepared, 144 bushels have been produced from one acre. And, I believe, it is not known what the increase may be brought to in rich lands by high cultivation.’

“ Some years since, I had beans dropt alternately with potatoes, at two feet distance in the rows, which were three feet apart, and ploughed in the intervals. The land adjoining was sown with beans and peas, which were a good crop; but those sown among the potatoes a better one. I pulled one stem of the beans planted with the potatoes, which had three branches rising from the bottom, and it produced 225 beans. In all the trials of drilled beans, most of the stems had two branches, with many pods upon each.—From these and other instances, I believe it is not yet known to what increase grain may be brought by drilling, good cultivation, and manure.

“ Horse-hoeing is certainly preferable to close drilling or hand-hoeing; but the latter is superior to broadcast.

“ Horse-hoeing the full depth increases the crop, by making it tiller or branch more than it otherwise would do; and the advantage is distinctly observable every hoeing, by the colour of the grain. It prepares the ground for the next crop, at the same time that it increases the crop growing, which hand-hoeing does not, although it may destroy the weeds. Thus drilled ground is kept in a loose open state to receive the benefit of the influence of the air and weather, which broadcast has not; and it is evident, from certain experience, that crops may be drilled many years to good advantage without manure.

“ Suppose the crops only 20 bushels per acre, what course of broadcast crops will give 5 l. an acre for the course? But suppose they are dunged the same as any ground in the most approved course, there is the greatest reason to expect as much as in the above experiment, which is 28 and three-quarters, and at 5s. per bushel amounts to 7l. 3s. 9d.

“ Calculations may be of service to those who wish to try drilling, and have few books to direct them.

“ One acre is 10 chains long, of 660 feet, or 220 yards long, and one yard broad, containing 4840 square yards. Then if the ridge is four feet six inches, this makes 14 ridges, and three feet to spare. This length of 220 yards, multiplied by 14 (the number of ridges) gives a length of yards 3080, to which add 146 for the spare three feet, and it will be 3226 yards. And as two rows are drilled on a ridge, the number of rows will be in length 6452 yards; but as a deduction of 172 yards must be made for the head ridges, suppose three yards each, &c. the whole length to be sown will be 6280 yards clear. Now a gallon (Winchester) holds about 80,000 grains. The quantity recommended to be drilled by Mr Forbes and others, being six gallons, or two-thirds of a bushel per acre, is nearly 78 grains to a yard, or 26 to a foot. But in my experiment, by this calculation, it was only about 11 grains to a foot; which is quite sufficient, if the seed be good, and it be not destroyed by vermin.

“ Now with regard to the quantity of land this drill-plough may sow; if a horse walks at the rate of two miles per hour, he goes 16 miles in eight hours, or 28,460 yards. As he sows two ridges at once, this is seven lengths and two-thirds per acre, or 1686 yards to sow an acre, being nearly 17 acres in a day.

“ Four horse-hoings are calculated equal to two ploughings. In plain ploughing they suppose the ridge is ploughed with four furrows, or eight for twice ploughing. The four horse-hoings are eight furrows, equal to two ploughings.

“ Mr Tull directs four hoeings, and Mr Forbes five. First, In November, when the plant has four blades. 2dly, In March, deep, and nearer the rows than the former; both these hoeings should be *from* the rows. 3dly, Hand-hoed when it begins to spindle, if the earth be crumbly, *to* the rows. 4thly, When it begins to blossom, *from* the rows, but as near to them as in the second hoeing. 5thly, When done blossoming, to ripen and fill the grain, *to* the rows.

“ The last hoeing Mr Tull does not direct, but Mr Forbes advises it, as being of essential service in filling the grain, and saving trouble in making the next seed-furrows. They advise the patent or sowing-plough for horse-hoeing; and the expence is calculated by Mr Craick at one guinea per acre, reaping included.

“ But let us suppose the following, which are the prices in the county I live in (Fife).

	L.	s.	d.
Ploughing to form the ridges,	-	0	4 0
Harrowing,	-	0	0 4
Four hoeings, equal to two ploughings,	-	0	8 0
Sowing,	-	0	0 4
Hand-hoeing twice,	-	0	8 0
Seed, one peck and a half, at 5s. a bushel,	0	1	10

Whole expence per acre, L. 1 2 6”

Drill-husbandry is, as a good writer has justly defined it, “*the practice of a garden brought into the field.*” Every man of the least reflection must be sensible, that the practice of the garden is much *better* than that of the field, only a little more expensive; but if (as is the case) this extra expence be generally much more than rapid by the superior goodness and value of drilled crops, it ought to have no weight in comparing the two modes of husbandry.

228
The drill and the broadcast methods more particularly compared.

Practice.

In the broadcast method the land is often sown in bad tilth, and always scattered at random, sometimes by very unskilful hands. In drilling, the land must be in fine order; the seed is set in trenches drawn regularly, all of nearly an equal depth, and that depth suited to the nature of each kind of seed. These seeds are also distributed at proper distances, and by being equally and speedily covered, are protected from vermin and other injuries; so that the practice of the garden is here exactly introduced into the field.

In the broadcast method the seed falls in some places too thick, in others too thin; and being imperfectly covered, a part of it is devoured by vermin which follow the sower; another part is left exposed to rain or frost, or to heats, which greatly injure it. When harrowed, a great part of it (small seeds especially) is buried so deep, that if the soil be wet, it perishes before it can vegetate.

Again: When thus sown, there is no meddling with the crop afterwards, because its growth is irregular. The soil cannot be broken to give it more nourishment, nor can even the weeds be destroyed without much inconvenience and injury.

But in the drill-husbandry the intervals between the rows, whether double or single, may be horse-hoed; and thereby nourishment may repeatedly be given to the plants, and the weeds almost totally destroyed.

The very same effects which digging has upon young shrubs and trees in a garden, will result from horse-hoeing in a field, whether the crop be corn or pulse: For the reason of the thing is the same in both cases, and being founded in nature and fact, cannot ever fail. In drilling, no more plants are raised on the soil than it can well support; and by dividing and breaking the ground they have the full advantage of all its fertility.

The plough prepares the land for a crop, but goes no further; for in the broadcast husbandry it cannot be used: but the crop receives greater benefit from the tillage of the land by the horse-hoe, while it is growing, than it could in the preparation. No care in tilling the land previous to sowing can prevent weeds rising with the crop; and if these weeds be not destroyed while the crop is growing, they will greatly injure it. In the broadcast husbandry this cannot be done; but in drilling, the horse-hoe will effect it easily.

And what adds to the farmer's misfortune is, that the most pernicious weeds have seeds winged with down, which are carried by the wind to great distances; such are thistles, sow-thistles, colts-foot, and some others.

If the expence of horse-hoeing be objected, there are two answers which may very properly be made: The first is, that this expence is much less than that of hand-hoeing were it practicable, or of hand-weeding. The second is, that it is more than rapid by the quantity of seed saved by drilling; to say nothing of the extra quantity and goodness of the crops, which are generally self-evident.

Upon the whole: If the particular modes of cultivating land by the new husbandry should, after all, be considered as perhaps too limited to be universally adopted; yet it has been of great use in raising suspicions concerning the old method, and in turning the views of philosophers and farmers towards improving in general. Many real improvements in agriculture have been the consequences of these suspicions; and as this spirit of inquiry remains in full vigour, a solid foundation is laid for expecting still further improvements in this useful art.

A G R

AGRIFOLIUM, or AQUIFOLIUM. See ILEX.
AGRIGENTUM, (anc. geog.), a city of Sicily, part of the site of which is now occupied by a town called *Girgenti* from the old name. See GIRGENTI.

According to ancient authors, Dedalus, the most famous mechanician of fabulous antiquity, fled to this spot for protection against Minos, and built many wonderful edifices for Cocalus king of the island. Long after his flight, the people of Gela sent a colony hither 600 years before the birth of Christ; and from the name of a neighbouring stream called the new city *Acragas*, whence the Romans formed their word *Agri-gentum*. These Greeks converted the ancient abode of the Siculi into a citadel to guard the magnificent city, which they erected on the hillocks below.

An advantageous situation, a free government with all its happy effects, and an active commercial spirit, exalted their commonwealth to a degree of riches and power unknown to the other Greek settlements, Syracuse alone excepted. But the prosperity of Agrigentum appears to have been but of short duration, and tyranny soon destroyed its liberties.

Phalaris was the first that reduced it to slavery. His name is familiar to most readers on account of his cruelty, and the brazen bull in which he tortured his enemies: (See PHALARIS.)—Phalaris met with the

A G R

common fate of tyrants, and after his death the Agrigentines enjoyed their liberty for 150 years; at the expiration of which term Thero usurped the sovereign authority. The moderation, justice, and valour of this prince preserved him from opposition while living, and have rescued his memory from the obloquy of posterity. He joined his son-in-law Gelo, king of Syracuse, in a war against the Carthaginians; in the course of which victory attended all his steps, and Sicily saw herself for a time delivered from her African oppressions. Soon after his decease, his son Thrasylus was despoiled of the diadem, and Agrigentum restored to her old democratical government. Ducetius next disturbed the general tranquillity. He was a chief of the mountaineers, descendants of the Siculi; and was an overmatch for the Agrigentines while they were unsupported by alliances, but sank under the weight of their union with the Syracusans. Some trifling altercations dissolved this union, and produced a war, in which the Agrigentines were worsted, and compelled to submit to humiliating terms of peace. Repentment led them to embrace with joy the proposals of the Athenians, then meditating an attack upon Syracuse. Their new friends soon made them feel that the sacrifice of liberty and fortune would be the price of their protection; and this consideration brought them

speedily.

Agrigentum.

speedily back to their old connections. But as if it had been decreed that all friendship should be fatal to their repose, the reconciliation and its effects drew upon them the anger of the Carthaginians. By this enemy their armies were routed, their city taken, their race almost extirpated, and scarce a vestige of magnificence was left. Agrigentum lay 50 years buried under its own ruins; when Timoleon, after triumphing over the Carthaginians, and restoring liberty to Sicily, collected the descendants of the Agrigentines, and sent them to re-establish the dwellings of their forefathers. Their exertions were rewarded with astonishing success; for Agrigentum rose from its ashes with such a renewal of vigour, that in a very short time we find it engaged in the bold scheme of seizing a lucky moment, when Agathocles and Carthage had reduced Syracuse to the lowest ebb, and arrogating to itself supremacy over all the Sicilian republics. Xenodocus was appointed the leader of this arduous enterprise; and had his latter operations been as fortunate as his first campaign, Agrigentum would have acquired such a preponderance of reputation and power, that the rival states would not even have dared to attack it. But a few brilliant exploits were succeeded by a severe overthrow; the Agrigentines lost courage, disagreed in council, and humbly sued for peace to Agathocles. This commonwealth afterwards took a strong part with Pyrrhus; and when he left Sicily to the mercy of her enemies, threw itself into the arms of Carthage. During the first Punic war Agrigentum was the head-quarters of the Carthaginians, and was besieged by the Roman consuls, who after eight months blockade took it by storm. It nevertheless changed masters several times during the contest between those rival states, and in every instance suffered most cruel outrages. After this period very little mention of it occurs in history, nor do we know the precise time of the destruction of the old city and the building of the new one. See

GIRGENTI.

The principal part of the ancient city lay in the vale; the present town, called Girgenti, occupies the mountain on which the citadel of Cocalus stood.

It was difficult to be more judicious and fortunate in the choice of situation for a large city. The inhabitants were here provided with every requisite for defence, pleasure, and comfort of life; a natural wall, formed by abrupt rocks, presented a strong barrier against assailants; pleasant hills sheltered them on three sides without impeding the circulation of air; before them a broad plain watered by the Acragas, gave admittance to the sea-breeze, and to a noble prospect of that awful element; the port or emporium lay in view at the mouth of the river, and probably the road across the flat was lined with gay and populous suburbs.

The hospitality and parade for which the Agrigentines are celebrated in history were supported by an extensive commerce; by means of which, the commonwealth was able to resist many shocks of adversity, and always to rise again with fresh splendour. It was, however, crushed by the general fall of Grecian liberty; the feeble remnants of its population, which had survived so many calamities, were at length driven out of its walls by the Saracens, and obliged to lock them-

selves up for safety among the bleak and inaccessible rocks of the present city.

At the north-east angle of the ancient limits, upon some foundations of large regular stones, a church has been erected; a road appears hewn in the solid rock for the convenience of the votaries that visited this temple in ancient days. It was then dedicated to Ceres and her daughter Proserpine, the peculiar patronesses of Sicily. Bishop Blaise has succeeded to their honours.

At the south-east corner, where the ground, rising gradually, ends in a bold eminence, which is crowned with majestic columns, are the ruins of a temple said to have been consecrated to Juno. To the west of this, stands the building commonly called the *Temple of Concord*; the stone of which, and the other buildings, is the same as that of the neighbouring mountains and cliffs, a conglutination of sea-sand and shells, full of perforations, of a hard and durable texture, and a deep reddish brown colour. This Doric temple has all its columns, entablature, pediments, and walls entire; only part of the roof is wanting. It owes its preservation to the piety of some Christians, who have covered half the nave, and converted it into a church consecrated under the invocation of St Gregory, bishop of Girgenti.

Proceeding in the same direction, you walk between rows of sepulchres cut in the rock wherever it admitted of being excavated by the hand of man, or was so already by that of nature. Some masses of it are hewn into the shape of coffins; others drilled full of small square holes employed in a different mode of interment, and serving as receptacles of urns. One ponderous piece of the rock lies in an extraordinary position; by the failure of its foundation, or the shock of an earthquake, it has been loosened from the general quarry, and rolled down the declivity, where it now remains supine with the cavities turned upwards. Only a single column marks the confused heap of moss-grown ruins belonging to the temple of Hercules. It stood on a projecting rock above a chasm in the ridge, which was cut through for a passage to the emporium.

In the same tract, over some hills, is situated the building usually called the tomb of Thero. It is surrounded by aged olive-trees, which cast a wild irregular shade over the ruin. The edifice inclines to the pyramidal shape, and consists at present of a triple plinth, and a base supporting a square pedestal: upon this plain solid foundation is raised a second order, having a window in each front, and at each angle two Ionic pilasters crowned with an entablature of the Doric order. Its inside is divided into a vault, a ground room, and one in the Ionic story, communicating with each other by means of a small internal staircase.

In the plain are seen the fragments of the temple of Esculapius; part of two columns and two pilasters, with an intermediate wall, support the end of a farmhouse, and were probably the front of the cella. Pursuing the track of the walls towards the west, you arrive at a spot which is covered with the gigantic remains of the temple of Jupiter the Olympian, minutely described by Diodorus Siculus. It may literally be said that it has not one stone left upon another; and it is barely possible, with the help of much conjecture, to discover the traces of its plan and dimensions. Di-

odorus

Agrigen-
tum,
Agrimonia.

odorus calls it the largest temple in the whole island: but adds, that the calamities of war caused the work to be abandoned before the roof could be put on; and that the Agrigentines were ever after reduced to such a state of poverty and dependence, that they never had it in their power to finish this superb monument of the taste and opulence of their ancestors. The length of this temple was 370 Greek feet, its breadth 60, and its height 220, exclusive of the foundations or basement story; the extent and solidity of its vaults and underworks were wonderful; its spacious porticos and exquisite sculpture were suited to the grandeur of the whole. It was not built in the usual style of Sicilian temples with a cella of massive walls and a peryptile, but was designed in a mixt taste with half columns let into the walls on the outside, the inside exhibiting a plain surface.

The next ruin belongs to the temple of Castor and Pollux; vegetation has covered the lower parts of the building, and only a few fragments of columns appear between the vines. This was the point of the hill where the wall stopt on the brink of a large fish-pond spoken of by Diodorus: it was cut in the solid rock 30 feet deep, and water was conveyed to it from the hills. In it was bred a great quantity of fish for the use of public entertainments; swans and various other kinds of wild fowl swam along its surface, for the amusement of the citizens, and the great depth of water prevented an enemy from surprising the town on that side. It is now dry and used as a garden. On the opposite bank are two tapering columns without their capitals, most happily placed in a tuft of carob trees. Monte Toro, where Hanno encamped with the Carthaginian army, before the Roman consuls drew him into an engagement that ruined his defensive plan, is a noble back-ground to this picturesque group of objects.—The whole space comprehended within the walls of the ancient city abounds with traces of antiquity, foundations, brick-arches, and little channels for the conveyance of water; but in no part are any ruins that can be presumed to have belonged to places of public entertainment. This is the more extraordinary, as the Agrigentines were a sensual people, fond of shews and dramatic performances, and the Romans never dwelt in any place long without introducing their savage games. Theatres and amphitheatres seem better calculated than most buildings to resist the outrages of time; and it is surprising that not even the vestiges of their form should remain on the ground.

AGRIMONIA, AGRIMONY: A genus of the digynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the 35th order, *Senticose*. The characters are these: The *calyx* is a monophyllous perianthium, divided into five acute segments, persistent, and fenced with another calyx: The *corolla* consists of five petals, flat, and crenated at the ends: The *stamina* have ten capillary filaments, shorter than the corolla, and inserted into the calyx; the antheræ are small, didymous, and compressed: The *pisillum* has a germen beneath; the styli are two, simple, and the length of the stamina: There is no *pericarpium*; the calyx is contracted in the neck, and indurated: The seeds are two, and roundish. Of this genus there are five species enumerated by botani-

cal writers; but none of them have any remarkable properties except the two following.

Species and properties. 1. The eupatoria, or common agrimony, grows naturally in several parts of Britain by the sides of hedges and of woods. It is eat by sheep and goats, but refused by horses and swine. The Canadians are said to use an infusion of the root in burning fevers with great success. An infusion of six ounces of the crown of the root in a quart of boiling water, sweetened with honey, and half a pint of it drank three times a-day, is an effectual cure for the jaundice, according to Dr Hill. He advises to begin with a vomit, afterwards to keep the belly soluble, and to continue the medicine as long as any symptoms of the disease remain. It is said to be an aperient, detergent, and strengthener of the viscera: Hence it is recommended in scorbutic disorders, in debility and laxity of the intestines, &c. Digested in whey, it affords an useful diet-drink for the spring- season, not ungrateful to the palate or stomach. Doctor Allston says, that the best mode of administering this herb is in powder, when the intention is to corroborate; and that if thus taken in a large quantity, we may expect many of the effects of the bark from it in agues.

2. The odorata, or sweet-scented agrimony. This grows near four feet high; the leaves have more pinnæ than the former; the serratures of the leaves are also sharper, and, when handled, they emit an agreeable odour. The leaves of this species make an agreeable cooling tea, which is sometimes prescribed by physicians as a drink for people in fevers.

Culture. Both these species may be propagated either by seed, or by parting the roots in autumn when the leaves begin to decay. The seeds ought also to be sown in this season; for if kept out of the ground till spring, they seldom come up that year.—Agrimony is a hardy perennial plant, and will thrive in almost any soil or situation; but the plants should not be placed nearer one another than two feet, that the roots may have room to spread.

Hemp AGRIMONY. See EUPATORIUM.

Water Hemp-AGRIMONY. See BIDENS.

AGRIONIA, in Grecian antiquity, festivals annually celebrated, by the Bœotians, in honour of Bacchus. At these festivals, the women pretended to search after Bacchus as a fugitive; and, after some time, gave over their inquiry, saying, that he was fled to the Muses, and was concealed among them.

AGRIOPHAGI, in antiquity, a name given to those who fed on wild beasts. The word is Greek, compounded of *αγριος*, "wild," "savage," and *φαγω*, "I eat." The name is given, by ancient writers, to certain people, real or fabulous, said to have fed altogether on lions and panthers. Pliny and Solinus speak of *Agriophagi* in Ethiopia, and Ptolemy of others in India on this side the Ganges.

AGRIPPA, in midwifery, a term applied to children, brought forth with their feet foremost.

AGRIPPA (Herod), the son of Aristobulus and Mariamne, and grandson to Herod the Great, was born in the year of the world 3997, three years before the birth of our Saviour, and seven years before the vulgar æra. After the death of Aristobu-

Agrimonia
||
Agrippa.

Agrippa. lus his father, Josephus informs us, that Herod his grandfather took care of his education, and sent him to Rome to make his court to Tiberius. The emperor conceived a great affection for Agrippa, and placed him near his son Drusus. Agrippa very soon won the graces of Drusus, and of the empress Antonia. But Drusus dying suddenly, all those who had been much about him were commanded by Tiberius to withdraw from Rome, lest the sight and presence of them should renew his affliction. Agrippa, who had indulged his inclination to liberality, was obliged to leave Rome overwhelmed with debts, and in a very poor condition. He did not think it fit to go to Jerusalem, because he was not able to make a figure there suitable to his birth. He retired therefore to the castle of Massada, where he lived rather like a private person than a prince. Herod the Tetrarch, his uncle, who had married Herodias his sister, assisted him for some time with great generosity. He made him principal magistrate of Tiberias, and presented him with a large sum of money: but all this was not sufficient to answer the excessive expences and profusion of Agrippa; so that Herod growing weary of assisting him, and reproaching him with his bad œconomy, Agrippa took a resolution to quit Judea and return to Rome. Upon his arrival, he was received into the good graces of Tiberius, and commanded to attend Tiberius Nero the son of Drusus. Agrippa, however, having more inclination for Caius the son of Germanicus, and grandson of Antonia, chose rather to attach himself to him; as if he had some prophetic views of the future elevation of Caius, who at that time was beloved by all the world. The great assiduity and agreeable behaviour of Agrippa so far engaged this prince, that he kept him continually about him.

Agrippa being one day overheard by Eutyches, a slave whom he had made free, to express his wishes for Tiberius's death and the advancement of Caius, the slave betrayed him to the Emperor; whereupon Agrippa was loaded with fetters, and committed to the custody of an officer. Tiberius soon after dying, and Caius Caligula succeeding him, the new Emperor heaped many favours and much wealth upon Agrippa; changed his iron fetters into a chain of gold; set a royal diadem upon his head; and gave him the tetrarchy which Philip, the son of Herod the Great, had been possessed of, that is, Batanæa and Trachonitis. To this he added that of Lyfania; and Agrippa returned very soon into Judea to take possession of his new kingdom.

Caius being soon after killed, Agrippa, who was then at Rome, contributed much by his advice to maintain Claudius in possession of the imperial dignity, to which he had been advanced by the army. But in this affair Agrippa acted a part wherein he showed more cunning and address than sincerity and honesty; for while he made a show of being in the interest of the senate, he secretly advised Claudius to be resolute, and not to abandon his good fortune. The Emperor, as an acknowledgment for his kind offices, gave him all Judea and the kingdom of Chalcis, which had been possessed by Herod his brother. Thus Agrippa became of a sudden one of the greatest princes of the East; and was possessed of as much, if not more, territories than had been held by Herod the Great his

grandfather. He returned to Judea, and governed it to the great satisfaction of the Jews. But the desire of pleasing them, and a mistaken zeal for their religion, induced him to commit an unjust action, the memory of which is preserved in Scripture, Acts xii. 1, 2, &c. for about the feast of the passover, in the year of Jesus Christ 44, St James major, the son of Zebedee and brother to St John the Evangelist, was seized by his order and put to death. He proceeded also to lay hands on St Peter, and imprisoned him, waiting till the festival was over, that he might then have him executed. But God having miraculously delivered St Peter from the place of his confinement, the designs of Agrippa were frustrated. After the passover, this prince went from Jerusalem to Cæsarea, and there had games performed in honour of Claudius. Here the inhabitants of Tyre and Sidon waited on him to sue for peace. Agrippa being come early in the morning to the theatre, with a design to give them audience, seated himself on his throne, dressed in a robe of silver-tissue, worked in the most admirable manner. The rising sun darted on it with its rays, and gave it such a lustre as the eyes of the spectators could not endure. When therefore the king spoke to the Tyrians and Sidonians, the parasites around him began to say, that it was the voice of a god, and not that of a man. Instead of rejecting these impious flatteries, Agrippa received them with an air of complacency; but at the same time observed an owl above him on a cord. He had seen the same bird before when he was in bonds by order of Tiberius; and it was then told him, that he should be soon set at liberty: but that whenever he saw the same thing a second time, he should not live above five days afterwards. He was therefore extremely terrified; and he died at the end of five days, racked with tormenting pains in his bowels, and devoured with worms. Such was the death of Herod Agrippa, after a reign of seven years, in the year of Christ 44.

AGRIPPA II. son of the preceding Herod, was made king of Chalcide; but three or four years after, he was deprived of that kingdom by Claudius, who gave him in the place of it other provinces. In the war Vespasian carried on against the Jews, Herod sent him a succour of 2000 men; by which it appears, that, tho' a Jew by religion, he was yet entirely devoted to the Romans, whose assistance indeed he wanted, to secure the peace of his own kingdom. He lived to the third year of Trajan, and died at Rome A. C. 100. He was the seventh and last king of the family of Herod the Great. It was before him and Berenice his sister, that St Paul pleaded his cause at Cæsarea.

AGRIPPA (Marcus Vespasianus), son-in-law to Augustus, of mean birth, but one of the most considerable generals among the Romans. Augustus's victory over Pompey and Mark Anthony was owing to his counsel: he adorned the city with the pantheon, baths, aqueducts, &c.

AGRIPPA (Cornelius), born at Cologne in 1486, a man of considerable learning, and by common report a great magician; for the monks at that time suspected every thing of heresy or sorcery which they did not understand. He composed his *Treatise of the Excellence of Women*, to insinuate himself into the favour of Margaret of Austria, governess of the Low-Countries. He accepted of the charge of historiographer to the emper-

ror, which that princeſs gave him. The treatiſe of the *Vanity of the Sciences*, which he publiſhed in 1530, enraged his enemies extremely; as did that of *Occult Philoſophy*, which he printed ſoon after at Antwerp. He was imprifoned in France for ſomething he had written againſt Francis I.'s mother; but was enlarged, and went to Grenoble, where he died in 1534. His works are printed in two volumes octavo.

AGRIPPINA, daughter of Germanicus, ſiſter of Caligula, and mother of Nero; a woman of wit, but exceſſively lewd. She was thrice married, the laſt time to Claudius her own uncle, whom ſhe poiſoned to make way for Nero her ſon. Nero afterward cauſed her to be murdered in her chamber, when ſhe bid the executioner ſtab her firſt in the belly that had brought forth ſuch a monſter.

AGRIPPINA COLONIA UBIORUM (anc. geog.); now *Cologne*: ſo called from Agrippina, the daughter of Germanicus, and mother of Nero, who had a colony ſent thither at her requeſt by the emperor Claudius, to honour the place of her birth. See *COLOGNE*.

AGRIPPINIANS, in church-hiſtory, the followers of Agrippinus biſhop of Carthage, in the third century, who firſt introduced and defended the practice of rebaptization.

AGROM, a diſeaſe frequent in Bengal and other parts of the Indies, wherein the tongue chaps and cleaves in ſeveral places, being extremely rough withal, and ſometimes covered with white ſpots. The Indians are very fearful of this diſeaſe, which they attribute to extreme heat of the ſtomach. Their remedy is, to drink ſome chalybeate liquor, or the juice of mint.

AGROSTEMA, WILD LYCHNIS, or CAMPION: A genus of the pentagynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 22d order, *Caryophyllei*. The characters are: The *calyx* is a ſingle-leaved perianthium, leathery, tubular, quinqueſdentated, and perſiſtent: The *corolla* conſiſts of five unguſtated petals: The *ſtamina* have ten ſubululated filaments; the antheræ are ſimple: The *piſtillum* has an egg-shaped germen; the ſtyli are five, filiform, erect, and the length of the ſtamina; the ſtigmata are ſimple: The *pericarpium* is an oblong covered capſule, having two cells and five valves: The *ſeeds* are numerous and kidney-shaped; the receptacula are as many as the ſeeds, the interior ones gradually longer.

Species. The moſt remarkable are, 1. The githago, hairy wild lychnis, or common campion, which grows naturally in corn-fields in moſt parts of Britain. The flowers appear in June, are generally purple, ſometimes white, and by cultivation yellow.

2. The coronaria, or ſingle-roſe campion. Of this ſpecies there are four varieties; one with deep red, another with ſeſh-coloured, a third with white, flowers; and a ſort with double flowers, which has turned moſt of the others out of the gardens.

3. The ſbos jovic, or umbelliferous mountain-campion, grows naturally upon the Helvetian mountains. It is a low plant with woolly leaves: the flower-ſtem riſes near a foot high; the flowers grow in umbels on the top of the ſtalk, and are of a bright red colour. They appear in July, and the ſeeds ripen in September.

Culture. The firſt and third ſpecies are annual plants, ſo muſt be propagated by ſeeds; but as the

firſt is found naturally in corn-fields, it is very ſeldom cultivated in gardens; the third ſort ſhould have a ſhady ſituation, and thrives beſt in a ſtrong ſoil. The ſecond ſpecies is perennial, but only thoſe varieties which have ſingle flowers produce any ſeeds; the double kind, therefore, as it produces no ſeeds, muſt be propagated by parting the roots in autumn, after the flowers are paſt. In doing this, every head which can be ſlipped off with roots ſhould be parted: theſe ſhould be planted in a border of freſh undunged earth, at the diſtance of ſix inches one from the other, obſerving to water them gently until they have taken root; after which they will require no more; for much wet is very injurious to them, as is alſo dung. In this border they may remain till ſpring, when they ſhould be planted in the borders of the flower-garden, where they will be very ornamental during the time of their flowering, which is in July and Auguſt.—This plant is eat by horſes, goats, and ſheep.

AGROSTIS, BENT-GRASS, in botany: A genus of the triandria order, belonging to the digynia claſs of plants; and, in the natural method, ranking under the 4th order, *Gramina*. The characters are: The *calyx* is a one-flowered, two-valved, pointed gluma, rather leſs than the corolla. The *corolla* is two-valved and pointed. The *ſtamina* have three capillary filaments, which are larger than the corolla. The *antheræ* are forked. The *piſtillum* has a roundiſh germen; the ſtyli are two, refleſted, and villous; the ſtigmata hiſped longitudinally. The *pericarpium* is the corolla growing to the ſeed, not gaping. The *ſeed* is one, globular, and pointed at both ends. There are 15 ſpecies; eight of them natives of Britain.

AGROSTOGRAPHIA, ſignifies the hiſtory or deſcription of graſſes. See *GRASS*.

AGROUND, the ſituation of a ſhip whoſe bottom, or any part of it, hangs, or reſts upon the ground, ſo as to render her immoveable, till a greater quantity of water floats her off, or till ſhe is drawn out into the ſtream by the application of mechanical powers.

AGRYPNIA, among phyſicians, implies an inappetite to ſleep; a troubleſome ſymptom of feveriſh and other diſorders.

AGRYPNIA, in the Greek church, implies the vigil of any of the greater feſtivals.

AGUE, a general name for all periodical fevers, which, according to the different times of the returns of the feveriſh paroxyſm, are denominated tertian, quartian, and quotidian. See *MEDICINE (Index.)*

AGUE-Cake, the popular name for a hard tumour on the left ſide of the belly, lower than the falſe ribs, ſaid to be the effect of intermitting fevers.

AGUE-Tree, a name given to the ſaffaſras, on account of its febrifuge qualities.

AGUEPERSE, a town of France, ſituated on the Lyonnais, about 15 miles north of Clermont.

AGUILLANEUF, or AUGILLANEUF, a form of rejoicing uſed among the ancient Franks on the firſt day of the year. The word is compounded of the French *A* "to," *gui* "miſleto," and *Pan neuf* "the new year." Its origin is traced from a druid-ceremony: the prieſts uſed to go yearly in December, which with them was reputed a ſacred month, to gather miſleto of the oak in great ſolemnity. The prophets marched in the front, ſinging hymns in honour of their deities;

T t

Aguilla-
neuf.

Aguillar
||
Agur.

after them came a herald with a caduceus in his hand; these were followed by three druids a-breast, bearing the things necessary for sacrifice; last of all came the chief or arch druid, accompanied with the train of people. The chief druid climbing the oak, cut off the mistle with a golden sickle, and the other druids received it in a white cloth; on the first day of the year it was distributed among the people, after having blessed and consecrated it by crying *A gui l'an neuf*, to proclaim the new year. This cry is still continued in Picardy, with the addition of *Plantez, Plantez*, to wish a plentiful year. In Burgundy and some other parts, the children use the same word to beg a new-year's gift. Of later times the name *Aguillaneuf* was also given to a sort of begging, practised in some dioceses, for church-tapers, on new-year's day, by a troop of young people of both sexes, having a chief, &c. It was attended with various ridiculous ceremonies, as dancing in the church, &c. which occasioned the synods to suppress it.

AGUILLAR, a town of Spain, in the province of Navarre, about 24 miles west of Estella.

AGUILLAR *Del Campo*, a town of Old Castile, with the title of marquifate, about 15 leagues north of the city of Burgos.

AGUILLONIUS (Francis), a Jesuit, born at Brussels: he was rector of the Jesuits college at Antwerp, and eminent for his skill in mathematics. He was the first who introduced that science among the Jesuits in the low countries: he wrote a book of Optics, and was employed in finishing his Catoptrics and Dioptrics, when death prevented him in 1617.

AGUIRRA (Joseph Sænz de), a Benedictine, and one of the most learned men of the 17th century, was born March 24. 1630. He was censor and secretary of the supreme council of the inquisition in Spain, and interpreter of the scriptures in the university of Salamanca. He printed three volumes in folio upon Philosophy, a commentary upon Aristotle's ten books of Ethics, and other pieces. He died at Rome August 19. 1699.

AGUL, in botany, a synonyme of the hedyсарum. See HEDYSARUM.

AGUR. The xxxth chapter of the Proverbs begins with this title: "The words of Agur, the son of Jakeh;" which, according to the signification of the original terms, may be translated, as the Vulgate has it, *Verba congregantis, filii vomentis*; which translation Le Clerc condemns, supposing these to be proper names, which ought not to be translated. These words are rendered by Lewis de Dieu: "The words of him who has recollected himself, the son of obedience." The generality of the fathers and commentators will have it, that Solomon describes himself under the name of Agur the son of Jakeh; others conjecture that Agur, as well as Lemuel (in chap. xxxi. 1.) were wise men who lived in the time of Solomon, and were his interlocutors in the book of Proverbs; an opinion which F. Calmet thinks is without the least shew of probability, this book being nothing like a dialogue. This last expositor thinks it probable, that Agur was an inspired author different from Solomon, whose sentences it was thought fit to join with those of this prince, because of the conformity of their matter.

AGURAH, in Jewish antiquity, the name of a silver coin, otherwise called *gerah* and *keshta*.

AGURIUM, or AGYRIUM (anc. geog.), a town of Sicily in the Val di Demona, near the river Seme tus. The people were called *Populus Agyrinensis* by Cicero; *Agyrinus* by Pliny. It was the birth-place of Diodorus Siculus, as he himself testifies; but he calls it *Argyrium*, as it is now called *S. Philippo d'Argirone*, which modern name seems to confirm that *Argyrium* is the true reading.

AGUSADURA, in ancient customs, a fee due from vassals to their lord for the sharpening their ploughing tackle. Anciently the tenants in some manors were not allowed to have their rural implements sharpened by any but whom the lord appointed; for which an acknowledgment was to be paid, called *Agusadura*, in some places *Agusage*: which some take to be the same with what was otherwise called *Reillage*, from the ancient French *reille*, a ploughshare.

AGUTI, in zoology, the trivial name of a species of the mouse, belonging to the mammalia glires of Linnæus. See MUS.

AGYEI, in antiquity, a kind of obelisks, sacred to Apollo, erected in the vestibles of houses, by way of security.

AGYNIANI, in church-history, a sect who condemned all use of flesh, and marriage, as not instituted by God, but introduced at the instigation of the devil. The word is compounded of the privative *a* and *γυνή* woman. They are sometimes also called *Agynneses*, and *Agynti*; and are said to have appeared about the year 694. It is no wonder they were of no long continuance. Their tenets coincide in a great measure with those of the Abelians, Gnostics, Cerdonians, and other preachers of chastity and abstinence.

AGYRTÆ, in antiquity, a kind of strolling impostors running about the country, to pick up money by telling fortunes at rich mens doors, pretending to cure diseases by charms, sacrifices, and other religious mysteries; also to expiate the crimes of their deceased ancestors, by virtue of certain odours and fumigations; to torment their enemies, by the use of magical verses and the like. The word is Greek *Αγυρται*, formed of the verb *αγυρω*, *I congregate*; alluding to the practice of Charletans, who gather a crowd about them.

Agyrtæ, among the Greeks, amount to the same with *Æruscatores* among the Latins, and differ not much from Gypsies among us.

AHAB, son of Omri king of Israel, succeeded his father A. M. 3086, and surpassed all his predecessors in impiety and wickedness. He married Jezebel the daughter of Ethbaal king of the Zidonians, who introduced the idols of Baal and Attarte among the Israelites, and engaged Ahab in the worship of these false deities. God, being provoked by the sins of Ahab, sent the prophet Elijah to him (1 Kings xvii. 1, seq.) who declared to him, that there would be a famine of three years continuance. The dearth having lasted three years, the prophet desired Ahab to gather all the people to mount Carmel, and with them the prophets of Baal: when they were thus assembled, Elijah caused fire to descend from heaven upon his sacrifice, after which he obtained of God that it should rain; and then the earth recovered its former fertility. Six years after this, Ben-hadad king of Syria (chap.

Agurak
||
Ahab.

Ahab.

xx.) laid siege to Jerusalem. But God, provoked at this proud Syrian, sent a prophet to Ahab, not only to assure him of victory, but to instruct him likewise in what manner he was to obtain it. Ahab was ordered to review the princes of the provinces, which he found to be a choice company consisting of 232 young men, who were to command the people in Samaria, amounting to about 7000 men: with this small army Ahab was directed to fall upon the great host of the Syrians, and that at noon-day, while Ben-hadad and the 32 kings that accompanied him were drinking and making merry. Ben-hadad having notice that they were marching out of the city, ordered them to be brought before him alive, whatever their designs were: but the young men, followed by this small army, advanced, and killing all that opposed them, such a panic seized the Syrian troops, that they began to fly; and even Ben-hadad himself mounted his horse and fled with his cavalry; which Ahab perceiving, pursued them, killed great numbers of them, and took a considerable booty. After this the prophet came to Ahab, to animate him with fresh courage, and to caution him to keep upon his guard; assuring him, that Ben-hadad would return against him the year following. According to this prediction, at the end of the year he returned and encamped at Aphek, with a resolution to give the Israelites battle. Both armies being ranged in order of battle for seven days successively, at length, upon the seventh day, a battle ensued, wherein the Israelites killed 100,000 of the Syrians, and the rest fled to Aphek; but as they were pressing to get into the city, the walls of Aphek fell upon them and killed 27,000 more. Ben-hadad throwing himself upon the mercy of Ahab, this prince received him into his own chariot, and made an alliance with him. The year following, Ahab desiring to make a kitchen-garden near his palace (chap. xxi.), requested of one Naboth, a citizen of Jezreel, that he would sell him his vineyard, because it lay convenient for him. But being refused, he returned in great discontentment to his house, threw himself upon the bed, turned towards the wall, and would eat nothing. Jezebel his wife coming in, asked the reason of his great concern; of which being informed, she procured the death of Naboth, and Ahab took possession of his vineyard. As he returned from Jezreel to Samaria, the prophet Elijah met him, and said, "Hast thou killed and also taken possession? Now saith the Lord, In the place where dogs licked up the blood of Naboth, shall dogs lick thy blood, even thine. As for Jezebel, of her the Lord spake, saying, The dogs shall eat Jezebel by the way of Jezreel." Ahab, hearing these and other denunciations, rent his clothes, put sackcloth upon his flesh, and gave other indications of his sorrow and repentance. But his repentance was neither sincere nor persevering. Two years after these things, Jehoshaphat king of Judah came to Samaria to visit Ahab (chap. xxii.) at a time when he was preparing to attack Ramoth-gilead, which Ben-hadad king of Syria unjustly withheld from him. The king of Israel invited Jehoshaphat to accompany him in this expedition; which that prince agreed to do, but desired that some prophet might first be consulted. Ahab therefore assembled the prophets of Baal, in number about 400; who all concurred in exhorting the king to march resolutely against Ramoth-gilead. But Micaiah

being also consulted, at Jehoshaphat's suggestion, prophesied the ruin of Ahab. Upon this, Ahab gave orders to his people to seize Micaiah, and to carry him to Amon the governor of the city, and to Joash the king's son; telling them in his name, "Put this fellow in prison, and feed him with the bread of affliction, and with the water of affliction, until I come in peace." But Micaiah said, "If thou return at all in peace, the Lord hath not spoken by me." Ahab therefore and Jehoshaphat marched up to Ramoth-gilead; and the king of Israel said unto Jehoshaphat, "I will disguise myself, and enter into the battle, but put thou on thy robes:" for he knew that the king of Syria had commanded two and thirty captains that had rule over his chariots, saying, "Fight neither with small nor with great, save only with the king of Israel." These officers therefore having observed that Jehoshaphat was dressed in royal robes, took him for the king of Israel, and fell upon him with great impetuosity: but this prince seeing himself pressed so closely, cried out; and the mistake being discovered, the captains of the king of Syria gave over pursuing him. But one of the Syrian army shot a random arrow, which pierced the heart of Ahab. The battle lasted the whole day, and Ahab continued in his chariot with his face turned towards the Syrians. In the mean time, his blood was still issuing from his wound, and falling in his chariot; and towards the evening he died: whereupon proclamation was made by sound of trumpet, that every man should return to his own city and country. The king of Israel being dead, was carried to Samaria and buried: but his chariot and the reins of his horses were washed in the fish-pool of Samaria, and the dogs licked his blood, according to the word of the prophet. Such being the end of Ahab; his son Ahaziah succeeded him, in the year of the world 3107.

AHÆTULA, the trivial name of a species of the coluber. See COLUBER.

AHASUERUS, or ARTAXERXES, the husband of Esther; and according to archbishop Usher and F. Calmet, the scripture name for Darius, the son of Hytaspes, king of Persia; though Scaliger will have Xerxes to be the husband of Esther, or the Ahasuerus of scripture; and Dr Prideaux believes him to be Artaxerxes Longimanus. See History of PERSIA.

AHAZ, king of Judah, the son of Jotham, remarkable for his vices and impieties. One of his sons he consecrated, by making him pass through and perish by the fire, in honour of the false god Moloch; and he offered sacrifices and incense upon the high places, upon hills, and in groves. Rezin king of Syria and Pekah king of Israel invaded Judea in the beginning of the reign of Ahaz; and having defeated his army and pillaged the country, they laid siege to Jerusalem. When they found that they could not make themselves masters of that city, they divided their army, plundered the country, and made the inhabitants prisoners of war. Rezin and his part of the confederate army marched with all their spoil to Damascus; but Pekah with his division of the army having attacked Ahaz, killed 120,000 men of his army in one battle, and carried away men, women, and children, without distinction, to the number of 200,000. But as they were carrying those captives to Samaria, the prophet Oded, with the principal inhabitants of the

Ahab
||
Ahaz.

Ahaz
||
Ahead.

city, came out to meet them; and by their remonstrances prevailed with them to set their prisoners at liberty. At the same time, the Philistines and Edomites invaded other parts of his land, killed multitudes of the people, and carried off much booty. In this distressed condition, Ahaz finding no other remedy for his affairs, sent ambassadors to Tiglath-pileser king of the Assyrians; and to engage him to his interest, he stripped the temple and city of all the gold which he could meet with, and sent it as a present. Accordingly Tiglath-pileser marched to the assistance of Ahaz, attacked Rezin and killed him, took his capital Damascus, destroyed it and removed the inhabitants thereof to Cyrene.

The misfortunes of this prince had no influence to make him better: on the contrary, in the times of his greatest affliction, he sacrificed to the Syrian deities, whom he looked upon as the authors of his calamities, and endeavoured to render propitious to him, by honouring them in this manner. He broke in pieces the vessels of the house of God, shut up the gates of the temple, and erected altars in all parts of Jerusalem. He set up altars likewise in all the cities of Judah, with a design to offer incense on them. At length he died, and was buried in Jerusalem, but not in the sepulchres of the kings of Judah his predecessors; which honour he was deprived of, on account of his iniquitous course of life. Hezekiah his son succeeded him in the year of the world 3278, before Jesus Christ 726.

AHAZIAH, the son and successor of Ahab king of Israel, reigned two years, part alone, and part with his father Ahab, who ordained him his associate in the kingdom a year before his death. Ahaziah imitated his father's impieties (1 Kings xxii. 52, seq.), and paid his adoration to Baal and Astarte, the worship of whom had been introduced in Israel by Jezebel his mother. The Moabites, who had been always obedient to the kings of the ten tribes ever since their separation from the kingdom of Judah, revolted after the death of Ahab, and refused to pay the ordinary tribute. Ahaziah had not leisure or power to reduce them (2 Kings i. 1, 2, &c.): for about the same time, having fallen through a lattice from the top of his house, he hurt himself considerably, and sent messengers to Ekron, in order to consult Baalzebub, the god of that place, whether he should recover of the indisposition occasioned by this accident. But the prophet Elijah went to Ahaziah, and declared that he should not recover from his illness: and accordingly he died in the year of the world 3108, and Jehoram his brother succeeded to the crown.

AHAZIAH, king of Judah, the son of Jehoram and Athaliah, succeeded his father in the kingdom of Judah in the year of the world 3119. He walked in the ways of Ahab's house, to which he was allied, his mother being of that family. He reigned only one year, being slain by Jehu the son of Nimshi.

AHEAD, a sea-term, signifying further onward than the ship, or at any distance before her, lying immediately on that point of the compass to which her stem is directed. It is used in opposition to *astern*, which expresses the situation of any object behind the ship. See *ASTERN*.

AHICCYATLI, in zoology, the Indian name of a serpent resembling the rattle-snake, only it wants the rattles. It is as fatal in the effect of its poison as any known species of serpent.

AHIJAH, the prophet of Shilo. He is thought to be the person who spoke twice to Solomon from God, once while he was building the temple (1 Kings vi. 11.), at which time he promised him his protection; and at another time (*id.* xi. 6.) after his falling into all his irregularities, when God expressed his indignation with great threatenings and reproaches. Ahijah was one of those who wrote the annals or history of this prince (2 Chr. ix. 29.). The same prophet declared to Jeroboam that he would usurp the kingdom (1 Kings xi. 29, &c.), and that two heifers should alienate him from the Lord, meaning the golden calves erected by Jeroboam, one at Dan, the other at Bethel. About the end of Jeroboam's reign, towards the year of the world 3046, Abijah the son of that prince fell sick; upon which Jeroboam sent his wife to this prophet to inquire what would become of the child. The queen therefore went to Ahijah's house in Shilo, disguised: But the prophet, upon hearing the sound of her feet, said, "Come in, thou wife of Jeroboam, why feignest thou thyself to be another? for I am sent to thee with heavy tidings." Then he commanded her to go and tell Jeroboam all the evil that the Lord had declared he would bring upon his house for his impieties; that so soon as she would enter into the city her son Abijah should die, and should be the only one of Jeroboam's house that should come to the grave or receive the honours of a burial. Ahijah in all probability did not long survive the time of this last prophecy; but with the time and manner of his death we are not acquainted.

AHITOPHEL, a native of Gillo, was for some time the counsellor of king David, whom he at length deserted, by joining in the rebellion of Absalom. This prince, upon his being preferred to the crown by the greatest part of the Israelites, sent for Ahitophel from Gillo (2 Sam. xv. 12.) to assist him with his advice in the present state of his affairs: for at that time Ahitophel's counsels were received as the oracles of God himself (*chap. xvi. ult.*). Nothing gave David more uneasiness than this event; and when Hushai his friend came to wait on him and attend him in his flight, he intreated him to return rather to Jerusalem, make a show of offering his services to Absalom, and endeavour to frustrate the prudent measures which should be proposed by Ahitophel. When Absalom was come to Jerusalem, he desired Ahitophel to deliberate with his other counsellors upon the measures which were proper for him to take. Ahitophel advised him in the first place to abuse his father's concubines; so that when his party should understand that he had dishonoured his father in this manner, they might conclude that there were no hopes of a reconciliation, and therefore espouse his interest more resolutely. A tent, therefore, being prepared for this purpose upon the terraces of the king's palace, Absalom, in the sight of all Israel, lay with his father's concubines. The next thing Ahitophel proposed was in the terms following: "Let me now choose out 12,000 men, and I will arise and pursue after David this night, and I will come upon him while he is weary and weak-handed, and I will make him

Ahiccyatli
||
Ahitophel.

him afraid, and all the people that are with him shall flee, and I will smite the king only; and I will bring back all the people unto thee; the man whom thou seekest is as if all returned; so all the people shall be in peace." This advice was very agreeable to Abfalom and all the elders of Israel. However, Abfalom desired Hushai to be called to have his opinion. Hushai being come, and hearing what advice Ahitophel had given, said, The counsel which Ahitophel has given is not good at this time; what, for the present, in my opinion, may do better, is this: Let all Israel be gathered unto thee, from Dan even to Beerfheba, as the fand that is by the sea for multitude, and put thyself in the midt of them, and wherever David is, we may fall upon him, and overwhelm him with our numbers, as the dew falleth upon the ground. This last advice being more agreeable to Abfalom and all the elders of Israel, was preferred; upon which Ahitophel saddled his afs, and went to his house at Gillo, hanged himself, and was buried in the sepulchre of his fathers. He foresaw, without doubt, all that would happen in consequence of Hushai's advice, and was determined to prevent the death which he had deserved, and which David would probably have inflicted on him, as soon as he should be resettled on his throne.

AHMELLA, in botany. See BIDENS.

AHOLIBAH and AHOLAH, are two feigned names made use of by Ezekiel (xxiii. 4.) to denote the two kingdoms of Judah and Samaria. Aholah and Aholibah are represented as two sisters of Egyptian extraction. Aholah stands for Samaria, and Aholibah for Jerusalem. The first signifies a *tent*; and the second, *my tent is in her*. They both prostituted themselves to the Egyptians and Assyrians, in imitating their abominations and idolatries: for which reason they were abandoned to those very people for whom they had shown so passionate and so impure an affection; they were carried into captivity, and reduced to the severest servitude.

AHOUI, in botany, a synonyme and also the trivial name of a species of CERBERA.

A-HULL, in the sea-language, the situation of a ship when all her sails are furled on account of the violence of the storm, and when having lashed her helm on the lee-side, she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

AHUN, a town in France, in the Upper Marche and generality of Moulins, and is a royal jurisdiction. It is seated on the river Creuse, near a Benedictine abbey of the same name, eight miles south-east of Guerret, 30 north-east of Lomages, and 55 south-east of Moulins. E. Long. 2. 8. N. Lat. 49. 5.

AHUYS, a town of Sweden. It is small, but very strong by its situation, and has a good port. It is in the principality of Gothland, in the territory of Bleckingy, near the Baltic sea, about 18 miles from Christianstadt. E. Long. 14. 10. N. Lat. 56. 20.

AI, (anc. geog.) a town in Judea, to the north of Jericho, called *Aiva* by Josephus, and the inhabitants *Ainata*. Joshua having sent a detachment of 3000 men against Ai, God permitted them to be repulsed on account of Achan's sin, who had violated the anathema pronounced against the city of Jericho. But after the expiation of this offence, God commanded Joshua

(chap. viii.) to march with the whole army of the Israelites against Ai, and treat this city and the kingdom thereof as he had treated Jericho, with this difference, that he gave the plunder of the town to the people. Joshua sent by night 30,000 men to lie in ambush behind Ai; having first well instructed those who had the command of them in what they were to do; and the next day, early in the morning, he marched against the city with the remainder of his army. The king of Ai perceiving them, sallied hastily out of the town with all his people, and fell upon the forces of the Israelites; who upon the first onset fled, as if they had been under some great terror.

As soon as Joshua saw the enemy all out of the gates, he raised his shield upon the top of a pike, which was the signal given to the ambuscade; whereupon they immediately entered the place, which they found without defence, and set fire to it. The people of Ai perceiving the smoke ascending, were willing to return, but discovered those who had set fire to the city in their rear, while Joshua and those who were with him turning about, fell upon them, and cut them in pieces. The king was taken alive, and afterwards put to death.

The chevalier Folard observes, that Joshua's enterprise on Ai, excepting in some particulars of military art, is very like that of Gibeah, which is scarce any thing more than a copy of it. It would appear, says that writer, by the scripture account, that Joshua was not the author of the stratagem made use of by him: for when God directs himself to Joshua, he says, 'Go up against Ai; lay an ambuscade behind the town; I have delivered the king and the people of it into thine hands;' yet notwithstanding this, God might leave the whole glory of the invention and execution of it to him, as to a great general. 'Joshua arose,' says the sacred author, 'and all the people of war, to go up against Ai (verse 3.); and Joshua chose out 30,000 mighty men of valour, and sent them away by night.' Folard remarks, that there is a manifest contradiction between this verse and the 12th, wherein it is said, that Joshua chose out 500 men, whom he sent to lie in ambush, between Bethel and Ai. How is this to be reconciled? Calmet says, that Masius allows but 5000 men for the ambuscade, and 25,000 for the attack of the city, being persuaded that an army of 600,000 men could only create confusion on this occasion, without any necessity for, or advantage in, such numbers: but the generality of interpreters, continues Calmet, acknowledge two bodies to be placed in ambuscade, both between Bethel and Ai; one of 25,000, and the other of 5000 men.

With regard to the signal Joshua made to that part of his army which lay in ambuscade, the learned Folard embraces the opinion of the Rabbins, who believe what is called the shield to be too small to serve for a signal: hence they make it to be the staff of one of their colours: from this, our author concludes, that the whole colours were used on the occasion; for in the Asiatic style, which is very near the poetic, the part is oftentimes to be taken for the whole.

AJALON, (anc. geog.) a town of the tribe of Dan, one of the Levitical. Another in the tribe of Benjamin, in whose valley Joshua commanded the moon to stand still, being then in her decrease, and

con-

Ajan
||
Aichstat

consequently to be seen at the same time with the sun.

AJAN, a coast and country of Africa, has the river Quilmanci on the south; the mountains from which that river springs, on the west; Abyffinia, or Ethiopia, and the strait of Babelmandel, on the north; and the eastern, or Indian ocean, on the east. The coast abounds with all necessaries of life, and has plenty of very good horses. The kings of Ajan are often at war with the emperor of the Abyffins; and all the prisoners they take they sell to the merchants of Cambaya, those of Aden, and other Arabs, who come to trade in their harbours, and give them in exchange, coloured cloths, glass-beads, raisins, and dates; for which they also take back, besides slaves, gold and ivory. The whole sea-coast, from Zanguebar to the strait of Babelmandel, is called the coast of Ajan; and a considerable part of it is styled the Desert-coast.

AJAX, the son of Oileus, was one of the principal generals that went to the siege of Troy: he ravished Cassandra the daughter of Priam, even in the temple of Minerva, where she thought to have found sanctuary. It is said, he made a serpent of fifteen feet long so familiar with him, that it eat at his table, and followed him like a dog. The Locrians had a singular veneration for his memory.

AJAX, the son of Telamon, was, next to Achilles, the most valiant general among the Greeks at the siege of Troy: he commanded the troops of Salamis, and performed many great actions, of which we have an account in the Iliad, in *Didys Cretenfis*, and in the 23d book of Ovid's *Metamorphoses*. He was so enraged that the arms of Achilles were adjudged to Ulyffes, that he immediately became mad. The Greeks paid great honours to him after his death, and erected a magnificent monument to his memory upon the promontory of Rhetium.

AJAX, in antiquity, a furious kind of dance, in use among the Grecians; intended to represent the madness of that hero after his defeat by Ulyffes, to whom the Greeks had given the preference in his contest for Achilles's arms. Lucian, in his treatise of Dancing, speaks of dancing the *Ajax*.—There was also an annual feast, called *Ajantia*, *Αϊαντία*, consecrated to that prince, and observed with great solemnity in the island of Salamis, as well as in Attica; where, in memory of the valour of Ajax, a bier was exposed, set out with a complete set of armour.

AJAZZO, a sea-port town of the island of Corsica, in the Mediterranean, with a bishop's see. Long. 26. 35. Lat. 41. 40.

AJAZZO, a sea-port town of Natolia, in the province of Caramania, anciently Silesia, seated on the coast of the Mediterranean, 30 miles north of Antioch and 50 west of Aleppo, where the city of Iffus anciently stood, and near which Alexander fought his second battle with Darius. Long. 33. 10. Lat. 37. 0.

AICHSTAT, a town of Germany, in Franconia, and capital of a bishopric of the same name. It is remarkable for a curious piece of workmanship, called the sun of the Holy Sacrament, which is in the church: it is of massy gold, of great weight, and is enriched with 350 diamonds, 1400 pearls, 250 rubies, and other precious stones. This place is moderately large, and seated in a valley on the river Altmul, 10 miles N.

of Newburgh, and 37 S. of Nuremberg. E. Lon. 11. 10. N. Lat. 49. 0. The bishopric is 45 miles in length and 17 in breadth; and the bishop is chancellor of the church of Mayence or Mentz.

AICUROUS, a species of parrot. See *PSITTACUS*.

AID, in a general sense, denotes any kind of assistance given by one person to another.

AID, in law, denotes a petition made in court to call in help from another person who has interest in land, or any other thing contested.

AID-de-camp, in military affairs, an officer employed to receive and carry the orders of a general.

AID, Auxilium, in ancient customs, a subsidy paid by vassals to their lords on certain occasions. Such were the aid of relief, paid upon the death of the Lord Mesne to his heir; the *aid cheval*, or capital aid, due to the chief lord on several occasions, as, to make his eldest son a knight, to make up a portion for marrying his daughter, &c.

AIDS, in the French customs, certain duties paid on all goods exported or imported into that kingdom.

Court of Aids, in France, a sovereign court established in several cities, which has cognizance of all causes relating to the taxes, gabelles, and aids, imposed on several sorts of commodities, especially wine.

AIDS, in the manege, are the same with what some writers call *cherishings*, and used to avoid the necessity of corrections.—The inner heel, inner leg, inner rein, &c. are called *inner aids*; as the outer heel, outer leg, outer rein, &c. are called *outer aids*.

AIDAN, a famous Scottish bishop of Lindisfarne, or Holy Island, in the 7th century, was employed by Oswald king of Northumberland in the conversion of the English, in which he was very successful. He died in 651.

AIGHENDALE, the name of a liquid measure used in Lancashire, containing seven quarts.

AIGLE, a bailiwick in the territory of Romand in Swisserland, consists of mountains and valleys, the principal of which are the Aigle and Bex. Through these is the great road from Vallais into Italy. When you pass by Villeneuve, which is at the head of the lake of Geneva, you enter into a deep valley three miles wide, bordered on one side with the Alps of Swisserland, and on the other with those of Savoy, and crossed by the river Rhone. Six miles from thence you meet with Aigle, a large town, seated on a wide part of the valley, where there are vineyards, fields, and meadows. The governor's castle is on an eminence that overlooks the town, and has a lofty marble tower. This government has nine large parishes; and is divided into four parts, Aigle, Bex, Olon, and Ormont. This last is among the mountains, and joins to Rougement. It is a double valley, abounding in pasture-lands. Ivorna, in the district of Aigle, was in part buried by the fall of a mountain, occasioned by an earthquake in 1584.

AIGLE, a small town, in France, in Upper Normandy, twenty-three miles from D'Evereux, and thirty-eight from Rouen. It is surrounded with walls and ditches, has six gates, three suburbs, and three parishes. It trades in corn, toys, and more particularly in needles and pins. E. Long. 1. 5. N. Lat. 48. 35.

AIGUILLON, a small town of France in the province of Guienne, situated at the conflux of the rivers Garonne and Lot.

Aid
||
Aiguillon.

Aiguifce
||
Ailred.

AIGUISCE, in heraldry, denotes a cross with its four ends sharpened, but so as to terminate in obtuse angles.—It differs from the cross fitchee, in as much as the latter tapers by degrees to a point, and the former only at the ends.

AILANA, **AILATH**, or **AHELOTH**, anciently a town of Arabia Petræa, situated near the Sinus Elanites of the Red Sea. It was also called *Elatb*, and *Eloth*, (Stephanus, Strabo, Moscs.) The same with *Elana*.

AILE, in law, a writ which lies where a person's grandfather, or great-grandfather, being seized of lands, &c. in fee-simple, the day that he died, and a stranger abates and enters the same day, and dispossesses the heir of his inheritance.

AILESBUURY, **AYLESBUURY**, or **ALESBUURY**, a borough town in Buckinghamshire, consisting of about 400 houses. It consists of several streets, though the houses are not very contiguous: these lie round about the market-place, in the middle of which is a convenient hall, where the sessions are held, and sometimes the assizes for the county. It sends two members to Parliament; has a market on Saturdays; and three fairs for cattle, viz. on the Saturday before Palm-sunday, June 14th, and September 25th. It is sixty miles south-east of Buckingham, and forty-four north-west of London. W. Long. 0. 40. N. Lat. 51. 40.

AILMER, or **ÆTHELMARE**, Earl of Cornwall and Devonshire, in the reign of king Edgar. It is not known of what family he was. His authority and riches were great, and so also in appearance was his piety. He founded the abbey of Cerne, in Dorsetshire; and had so great a veneration for Eadwald, the brother of St Edmund the martyr, who had lived a hermit in that country, near the silver well, as they called it, that, with the assistance of Archbishop Dunstan, he translated his relics to the old church of Cerne. In 1016, when Canute, the son of Suane, invaded England, and found himself stoutly opposed by that valiant Saxon prince Edmund Ironside, the son of Æthelred, this Earl Ailmer, with that arch traitor Eadric Streone, Earl of Mercia, and Earl Algar, joined the Dane against their natural prince, which was one great cause of the Saxons ruin. He did not long survive this; and we find mentioned in history only one son of his, whose name was Æthelward, Earl of Cornwall, who followed his father's maxims, and was properly rewarded for it. For in 1018, Canute reaping the benefit of their treasons, and perceiving that the traitors were no longer useful, he caused the infamous Eadric Streone, and this Earl Æthelward, to be both put to death.

AILRED, or **EALRED**, abbot of Revesby in Lincolnshire, in the reigns of Stephen and Henry II. He was born in 1109, of a noble family, and educated in Scotland with Henry the son of king David. On his return to England, he became a monk of the Cistercian order, in the monastery of Revesby, of which he afterwards was made Abbot. He died on the 12th of January 1166, aged 57, and was buried in his monastery. "He was (says Leland) in great esteem during his life; celebrated for the miracles wrought after his death; and admitted into the catalogue of saints." He was author of several works; most of which were published by Gilbo the Jesuit at Douay, 1631; part

of them may be also found in the *Bibliotheca Cisterciensis*, and *Bibliotheca Patrum*. His principal works is the *Speculum charitatis*. Leland, Bale, and Pits, mention several manuscripts which never were published.

AILSA, an insulated rock on the western coast of Scotland, between the shores of Airshire and Cantire. It is two miles in circumference at the base, is accessible only at one place, and rises to a great height in a pyramidal form. A few goats and rabbits pick up a subsistence among the short grass and furze; but the importance of the rock consists in the great variety and boundless numbers of birds, by which it is frequented, particularly the gannets or solan-geese, whose young are used at the best tables, and bring a good price. Other birds are caught for their feathers. The rock is rented from the Earl of Cassilis at L. 33 per annum. The depth of water around the base is from 7 to 48 fathoms. It is surrounded with excellent banks, well stocked with cod and other white fish.

AINSWORTH (Dr Henry), an eminent nonconformist divine, who, about the year 1590, distinguished himself among the Brownists; which drew upon him such troubles that he was obliged to retire to Holland, and became minister of a church at Amsterdam. His skill in the Hebrew language, and his excellent Annotations on the Holy Scriptures, which are still highly esteemed, gained him great reputation. He also wrote several pieces in defence of the Brownists, and several other works.

AINSWORTH (Robert), born at Woodyale in Lancashire in 1660, was master of a boarding-school at Bethnal-green, from whence he removed to Hackney, and to other places in the neighbourhood of London. After acquiring a moderate fortune, he retired, and lived privately till the time of his death, which happened in 1743. We are indebted to him for the best Latin and English Dictionary extant: he published it in quarto 1736; and in 1752, the fourth edition, under the care of Doctor Ward of Gresham College, and the Rev. William Younge, was enlarged to two vols folio.

AIR, in natural philosophy, a thin, fluid, elastic, transparent, ponderous, compressible, and dilatable body, surrounding the terraqueous globe to a considerable height. See **AEROLOGY**, **ATMOSPHERE**, and **PNEUMATICS**.

Impregnation of Water with Fixed AIR, and with Sulphureous AIR. See **MINERAL Waters**.

AIR, in Medicine, &c. makes one of the six non-naturals.—From observations on bleeding in rheumatism, and after taking cold, it is evident, the air can enter with all its qualities, and vitiate the whole texture of the blood, and other juices.—From the palsies, vertigoes, and other nervous affections caused by damps, mines, &c. it is evident, that air thus qualified can relax and obstruct the whole nervous system. And from the colics, fluxes, coughs, and consumptions produced by damp, moist, and nitrous air, it is evident it can corrupt and spoil the noble organs, &c.

Circulation of AIR in Rooms. To render the circulation of air sensible, let the air of a room be heated by a strong fire, whilst the air of a contiguous room is cold; then let the door between these two rooms be opened, in which case the hot air of one room being lighter, will pass through the upper part of the opening of the door into the cold room; and, on the contrary, the cold

Ailfa
||
Air.

Air.

cold air of the other room being heavier, will pass into the former room through the lower part of the opening; accordingly, it will be found, that applying a lighted candle at the top, in the middle, and at the lower part of the opening between the two rooms, a strong current of air will appear to pass from the hot into the cold room near the top; a contrary current of air will appear to pass from the latter into the former room near the lower part of the said opening; whilst in the middle there is little or no motion at all, as may be clearly perceived by the direction of the flame of the candle.

It is for the same reason that when the fire is lighted in a chimney, a strong current of air is occasioned to enter the room, which may be felt by applying the hand near the key-hole, or other such small openings, if the doors and windows are shut; for the air over the fire being heated, becomes lighter, and ascends into the chimney, consequently other colder air must supply its place, which forces its way through all the small openings it can find. Were a room with a fire in it to be perfectly closed, excepting the chimney, the air in it would soon become unwholesome for respiration, and the fire would be soon extinguished, besides other inconveniences. Hence it appears, that those persons mistake who expect to keep the air of a room sweet and wholesome, especially for convalescents, by accurately stopping all the smallest openings that admit fresh air. When the current of air that enters into a room is on some side of it where it falls immediately upon the persons who sit in the room, then it may be offensive, especially to delicate constitutions. In that case, such opening should be closed: but at the same time another opening should be made for admitting fresh air, in another more convenient part; for a circulation of air, especially in rooms where a fire is kept, is not only salutary and useful, but is absolutely necessary.

In an ingenious publication, intitled, *A Practical Treatise on Chimneys*, there are the following remarks relating to the properest method of admitting air into a room, and of expelling the contaminated air. The author, directing to make a vent-hole near the top of the room, in order to expel the heated and contaminated air, "this," says he "might be done by means of a small tube opening into the room, either in or near the ceiling; which might either be carried to the top of the building, or be made to communicate with the external air by a small perforation through the wall at the roof of the room; by means of either of which, a proper circulation would be established, and the foul air be carried off.

N^o 9.

Air.

"For the fire would no sooner have warmed any particles of air within the room, than these would be greatly expanded, and rise immediately upwards, so as to fill the higher parts of the room with rarefied air; and as other particles would be successively heated and rarefied in their turn, by their expansive force they would press upon the sides of the apartment in every place, so as to force the lightest particles through the opening left for that purpose in the top of the room; by which means the foulest air would be gradually drawn off, without descending again into the lower regions to the annoyance of the company."

But in order to admit fresh air into the room, "Let," says he, "another opening be made in the ceiling of the room, having a communication with a small pipe that should lead from thence either to the outside of the wall, or to any other part of the building that might be judged more convenient, where it should be bent, and conducted downwards, till it reached the ground; where it should be left open, to communicate with the external air.—In this situation the cool external air would be forced in at the lower opening of the tube, and made to ascend into the apartment in proportion to the quantity that escaped towards the higher regions by means of the ventilator. And as that weighty air would no sooner enter the room, than it would tend towards the floor by its own natural gravity, it would gradually mix with the heated air in its descent—become, in some measure, warmed by that means, and equally dispersed through the room, so as slowly and imperceptibly to reach the candles and the company in the room, and supply them with a sufficient quantity of fresh and wholesome air, without the inconveniences to which the company are subjected by the usual way of admitting fresh air (A). For if it enters near the floor of the apartment, it is hurried along in a rapid undivided stream towards the fire-place, and striking upon the legs and inferior parts of the body, affects them with a strong sensation of cold. To overcome the effects of this, large fires must be kept; by which other parts of the body are warmed to an extraordinary degree, which is productive of most of those disorders that are pernicious to the young, and often prove fatal to the old, during the winter-season, in these cold regions.

"Thus might our apartments be kept constantly, and moderately, and equally warm, at a moderate expence, without endangering our health on the one hand, by respiring a confined, stagnant, and putrid air, or, on the other hand, by subjecting ourselves to such danger of catching colds, consumptions, and rheumatic complaints, by being exposed to such exceedingly unequal

(A) Such readers as have been little accustomed to speculations of this sort, will be at a loss to comprehend in what manner two holes, both of them in the roof of the room, and communicating with the air, without any valve, or other contrivance, for opening or closing of themselves, should yet answer the two very opposite purposes; one, of constantly bringing cool air into the room without emitting any warm air—and the other, of as constantly emitting warm and admitting no cool air. They will please to advert, that the one of these tubes communicates with the atmosphere at the bottom of the house, and the other towards the top: the opening of the one is beneath the level of the room, that of the other above it. Now, as the air is more dense at the surface of the ground than at any height above it, the warm rarefying air will naturally issue at that opening where it meets with least resistance, which must invariably be through that which opens to the external air at the greatest height; and as the cool air will naturally be pressed into the room by that opening where the air is most weighty, this must invariably be by that which is nearest the surface of the earth.

Air
||
Air-gun.

equal degrees of heat and cold, as are unavoidable where our apartments are so open as to admit a ready passage to the external air during the winter-season.

"The reader will easily perceive, that all that has been here said has a reference only to those apartments in cold climates, and rigorous weather, where fire to warm them becomes necessary. In warmer regions, or during the summer-season, there can be no objection to the wheel-ventilator in the window.—It is a simple contrivance, and a safe and effectual mean of preserving the air in our apartments sweet and wholesome at that season."

It is a vulgar error among many people, to believe that fire purifies the contaminated air, by destroying the noxious particles mixed with it; and for this reason they think, that the fire kept in a room where the air is tainted, purifies the room, by rendering the air in it again fit for respiration. Indeed, a fire kept in a room or apartment where the air is tainted, as is the case with hospitals, goals, and the like, does certainly purify the apartment, and the practice is very useful; but this effect is only because the fire promotes the circulation of the air, and dries the dampness of rooms, furniture, &c.: so that it is not the infected air that is purified, but is new, fresh, and wholesome air, that by the action of the fire has taken the place of the infected air; which infected air, being rarefied by the heat, has been expelled from the apartment. Fire and combustion in general is so far from purifying contaminated air, that it actually contaminates a prodigious quantity of it in a short time; so that not only a common fire, but even a lighted candle, when kept in a well-closed room, wherein the external air has not a free access, instead of purifying, renders the air of that room noxious.

Instrument for ascertaining the Purity or Wholesomeness of respirable AIR. See EUDIOMETER.

AIR BALLOONS, a general name given to bags of any light substance filled with inflammable air, or other permanently elastic fluid, whose specific gravity is considerably less than that of common atmospheric air. The consequence of their being filled in this manner is, that if they are of any considerable magnitude, they ascend in the air to an amazing height; and will not only ascend in this manner by themselves, but carry up along with them great weights, and continue to rise till they attain an height in which the circumambient air is of the same specific gravity with themselves. In this situation they will either float or be driven in the direction of the wind or current of air in which they are exposed, remaining in these elevated regions till the fluid escapes by the bursting of the bags from the superior elasticity of the fluid, or by its gradual evaporation through the pores of the envelope. The history, principles, &c. of those machines are detailed under the article **AEROSTATION**.

AIR-Bladder, in fishes. See **COMPARATIVE ANATOMY**, chap. iii. and **ICHTHYOLOGY**.

AIR-Gun, a pneumatic machine for exploding bullets, &c. with great violence.

The common air-gun is made of brass, and has two barrels; the inside barrel, *A*, fig. 8. which is of a small bore, from whence the bullets are exploded; and a large barrel *E.C.D.R.* on the outside of it. There is a syringe *S.M.N.P.* fixed in the stock of the gun, by which the

air is injected into the cavity between the two barrels through the valve *E.P.* The ball *K* is put down into its place in the small barrel, with the rammer, as in any other gun. At *S.L.* is another valve, which, being opened by the trigger *O*, permits the air to come behind the bullet, so as to drive it out with great force. If this valve be opened and shut suddenly, one charge of condensed air may be sufficient for several discharges of bullets; but if the whole air be discharged on one single bullet, it will drive it out with a great force. This discharge is effected by means of a lock, fig. 9. placed here as usual in other guns; for the trigger being pulled, the cock will go down and drive the lever *O*, fig. 8. which will open the valve, and let in the air upon the bullet *K*.

Air-guns of late years have received very great improvements in their construction. Fig. 10. is a representation of one made by the late Mr B. Martin of London, and now by several of the mathematical instrument and gun makers of the metropolis. For simplicity and perfection it exceeds any other heretofore contrived. *A* is the gun-barrel, with the lock, stock, ram-rod, and of the size and weight of a common fowling-piece. Under the lock, at *b*, is a round steel tube, having a small moveable pin in the inside, which is pushed out when the trigger *a* is pulled, by the spring-work within the lock; to this tube *b*, a hollow copper-ball *c* screws, perfectly air-tight. This copper ball is fully charged with condensed air by the syringe *B* (fig. 7.) previous to its being applied to the tube *b* of fig. 10. It is then evident, that if a bullet be rammed down in the barrel, the copper ball screwed fast at *b*, and the trigger *a* be pulled, that the pin in *b* will, by the action of the spring-work within the lock, forcibly strike out into the copper ball; and thereby pushing in suddenly a valve within the copper ball, let out a portion of the condensed air; which air will rush up thro' the aperture of the lock, and forcibly act against the bullet, driving it to the distance of 60 or 70 yards or further. If the air is strongly condensed at every discharge, only a portion of the air escapes from the ball; therefore, by re-cocking the piece, another discharge may be made; and this repeated to the amount of 15 or 16 times. An additional barrel is sometimes made, and applied for the discharge of shot, instead of the one above described.

The air in the copper ball is condensed by means of the syringe *B* (fig. 7.), in the following manner: The ball *c* is screwed quite close on the top of the syringe at *b*, at the end of the steel pointed rod: *a* is a stout ring through which passes the rod *k*: upon this rod the feet use to be formerly set; then the hands are to be applied to the two handles *i i*, fixed on the side of the barrel of the syringe. Now by moving the barrel *B* steadily up and down on the rod *a*, the ball *c* will become charged with condensed air; and it may be easily known when the ball is as full as possible, by the irresistible action that the air makes against the piston when you are working the syringe. At the end of the rod *k* is usually a four-square hole, which with the rod serves as a key to fasten the ball *c* fast on the screw *b* of the gun and syringe close to the orifice in the ball *c*. In the inside is fixed a valve and spring, which gives way for the admission of air; but upon its emission comes close up to the orifice, shutting up the internal

Air-gun.

Air-gun. air. The piston-rod works air-tight, by a collar of leather on it, in the barrel B; it is therefore plain, when the barrel is drawn up, the air will rush in at the hole *b*. When the barrel is pushed down, the air therein contained will have no other way to pass from the pressure of the piston but into the ball *c* at top. The barrel being drawn up, the operation is repeated, until the condensation is so strong as to resist the action of the piston.

Sometimes the syringe is applied to the end of the barrel C (see fig. 11.); the lock and trigger shut up in a brass case *d*; and the trigger pulled, or discharge made, by pulling the chain *b*. In this contrivance there is a round chamber for the condensed air at the end of the syringe at *e*, and it has a valve acting in a similar manner to that of the copper ball. When this instrument is not in use, the brass case *d* is made to slide off, and the instrument then becomes a walking-stick; from which circumstance, and the barrel being made of cane, brass, &c. it has received the appellation of the *Air-cane*. The head of the cane unscrews and takes off at *a*, where the extremity of the piston-rod in the barrel is shown: an iron rod is placed in a ring at the end of this, and the air condensed in the barrel in a similar manner to that of the gun as above; but its force of action is not near so strong and permanent as that of the latter.

The *Magazine Air-gun* was invented by that ingenious artist L. Colbe. By this contrivance ten bullets are so lodged in a cavity, near the place of discharge, that they may be drawn into the shooting-barrel, and successively discharged so fast as to be nearly of the same use as so many different guns.

Fig. 12. represents the present form of this machine, where part of the stock is cut off, to the end of the injecting syringe. It has its valve opening into the cavity between the barrels, as before. K K is the small shooting-barrel, which receives the bullets from the magazine E D, which is of a serpentine form, and closed at the end D when the bullets are lodged in it. The circular part *abc*, is the key of a cock, having a cylindrical hole through it, *ik*, which is equal to the bore of the same barrel, and makes a part of it in the present situation. When the lock is taken off, the several parts Q, R, T, W. &c. come into view, by which means the discharge is made by pushing up the pin Pp, which raises and opens a valve V, to let in the air against the bullet I, from the cavity F F; which valve is immediately shut down again by means of a long spring of brass NN. This valve V being a conical piece of brass, ground very true in the part which receives it, will of itself be sufficient to confine the air.

To make a discharge, you will pull the trigger ZZ, which throws up the seer *ya*, and disengages it from the notch *a*, upon which the strong spring WW moves the tumbler T, to which the cock is fixed. This, by its end *u*, bears down the end *v* of the tumbling lever R, which, by the other end *m*, raises at the same time the flat end of the horizontal lever Q; and by this means, of course, the pin Pp, which stands upon it, is pushed up, and thus opens the valve V, and discharges the bullet. This is all evident from a bare view of the figure.

To bring another bullet to succeed that marked I, instantaneously, turn the cylindrical cavity of the key of

the cock, which before made part of the barrel K K, into the situation *ik*, so that the part *i* may be at K; and hold the gun upon your shoulder, with the barrel downwards and the magazine upwards, by which means that bullet next the cock will fall into it out of the magazine, but go no farther into this cylindrical cavity than the two little springs *ss*, which detain it. The two circles represent the cock-barrel, wherein the key abovementioned turns upon an axis not represented here, but visible in fig. 13. This axis is a square piece of steel, on which comes the square hole of the hammer H, fig. 14.; by which the cylindrical cavity mentioned is opened to the magazine. Then opening the hammer, as in that figure, the bullet is brought into its proper place near the discharge-valve, and the cylindrical cavity of the key of the cock again makes part of the inward barrel K K.

It evidently appears how expeditious a method this is of charging and discharging a gun; and were the force of condensed air equal to that of gun-powder, such an air-gun would answer the end of several guns.

In the air-gun, and all other cases where the air is required to be condensed to a very great degree, it will be requisite to have the syringe of a small bore, viz. not exceeding half an inch in diameter; because the pressure against every square inch is about 15 pounds, and therefore against every circular inch about 12 pounds. If therefore the syringe be one inch in diameter, when one atmosphere is injected, there will be a resistance of 12 pounds against the piston; and when 10 are injected, there will be a force of 120 pounds to be overcome; whereas 10 atmospheres act against the circular half-inch piston (whose area is only one-fourth part so big) with only a force equal to 30 pounds; or 40 atmospheres may be injected with such a syringe, as well as 10 with the other. In short, the facility of working will be inversely as the squares of the diameter of the syringe.

Air-Jacket, a sort of jacket made of leather, in which are several bags, or bladders, composed of the same materials, communicating with each other. These are filled with air through a leather tube, having a brass stop-cock accurately ground at the extremity, by which means the air blown in through the tube is confined in the bladders. The jacket must be wet, before the air be blown into the bags, as otherwise it will immediately escape through the pores of the leather. By the help of these bladders, which are placed near the breast, the person is supported in the water, without making the efforts used in swimming.

Air-Pipes, an invention for drawing foul air out of ships, or any other close places, by means of fire. These pipes were first found out by one Mr Sutton, a brewer in London; and from him have got the name of *Sutton's Air-pipes*. The principle on which their operation depends is known to every body, being indeed no other than that air is necessary for the support of fire; and, if it has not access from the places most adjacent, will not fail to come from those that are more remote. Thus, in a common furnace, the air enters through the ash-hole; but if this is closed up, and a hole made in the side of the furnace, the air will rush in with great violence through that hole. If a tube of any length whatever is inserted in this hole, the air will rush through the tube into the fire, and of

Air-gun
||
Air-pipes

Air-pipes. consequence there will be a continued circulation of air in that place where the extremity of the tube is laid. Mr Sutton's contrivance then, as communicated to the Royal Society by Doctor Mead, amounts to no more than this.—“As, in every ship of any bulk, there is already provided a copper or boiling-place proportionable to the size of the vessel; it is proposed to clear the bad air, by means of the fire already used under the said coppers or boiling-places for the necessary uses of the ship.

“It is well known, that, under every such copper or boiler, there are placed two holes, separated by a grate; the first of which is for the fire, and the other for the ashes falling from the same; and that there is also a flue from the fire-place upward, by which the smoke of the fire is discharged at some convenient place of the ship.

“It is also well known, that the fire once lighted in these fire-places, is only preserved by the constant draught of air through the forementioned two holes and flue; and that if the said two holes are closely stopped up, the fire, though burning ever so briskly before, is immediately put out.

“But if, after shutting up the abovementioned holes, another hole be opened, communicating with any other room or airy place, and with the fire; it is clear, the said fire must again be raised and burn as before, there being a like draught of air through the same as there was before the stopping up of the first holes; this case differing only from the former in this, that the air feeding the fire will now be supplied from another place.

“It is therefore proposed, that, in order to clear the holds of ships of the bad air therein contained, the two holes abovementioned, the fire-place and ash-place, be both closed up with substantial and tight iron-doors; and that a copper or leaden pipe, of sufficient size, be laid from the hold into the ash-place, for the draught of air to come in that way to feed the fire. And thus it seems plain, from what has been already said, that there will be, from the hold, a constant discharge of the air therein contained; and consequently, that that air, so discharged, must be as constantly supplied by fresh air down the hatches or such other communications as are opened into the hold; whereby the same must be continually freshened, and its air rendered more wholesome and fit for respiration.

“And if into this principal pipe so laid into the hold, other pipes are let in, communicating respectively either with the well or lower decks; it must follow, that part of the air, consumed in feeding the fire, must be respectively drawn out of all such places to which the communication shall be so made.”

This account is so plain, that no doubt can remain concerning the efficacy of the contrivance: it is evident, that, by means of pipes of this kind, a constant circulation of fresh air would be occasioned thro' those places where it would otherwise be most apt to stagnate and putrefy. Several other contrivances have been used for the same purpose; and Doctor Hales's ventilators, by some unaccountable prejudice, have been reckoned superior in efficacy and even simplicity to Mr Sutton's machine, which at its first invention met with great

who used all his interest for that purpose, was shamefully neglected. *Air-pipes.*

A machine capable of answering the same purpose was invented by Mr Defaguliers, which he called the *ship's lungs*. It consisted of a cylindrical box set up on its edge, and fixed to a wooden pedestal. From the upper edge of the box issued a square trunk open at the end, and communicating with the cavity of the box. Within this box was placed a cylindrical wheel turning on an axis. It was divided into 12 parts, by means of partitions placed like the radii of a circle. These partitions did not extend quite to the centre, but left an open space of about 18 inches diameter in the middle; towards the circumference, they extended as far as possible without interfering with the case, so that the wheel might always be allowed to turn freely.—Things being thus circumstanced, it is plain, that if the wheel was turned towards that side of the box on which the trunk was, every division would push the air before it, and drive it out through the trunk, at the same time that fresh air would come in through the open space at the centre, to supply that which was thrown out thro' the trunk. By turning the wheel swiftly, a strong blast of air would be continually forced out thro' the square trunk, on the same principles on which a common farmer winnows corn. If the wheel is turned the opposite way, a draught of air may be produced from the trunk to the centre. If this machine, then, is placed in a room where a circulation of air is wanted, and the trunk made to pass through one of the walls; by turning the wheel swiftly round, the air will be forced with great velocity out of that room, at the same time that fresh air will enter through any chinks by which it can have access to supply that which has been forced out.

It is evident, that the circulation which is promoted by this machine, is entirely of the same kind with that produced by Mr Sutton's; the turning of the wheel in Mr Defaguliers's machine being equivalent to the rarefaction of the air by fire in Mr Sutton's: but that the latter is vastly superior, as acting of itself, and without intermission, requires no arguments to prove. Mr Sutton's machine has yet another conveniency, of which no other contrivance for the same purpose can boast; namely, that it not only draws out putrid air, but destroys it by causing it pass through fire; and experience has abundantly shown, that though putrid air is thrown into a great quantity of fresh air, it is so far from losing its pernicious properties, that it often produces noxious diseases. We do not say, indeed, that putrid air becomes salutary by this means; but it is undoubtedly rendered less noxious than before; tho' whether it is equally innocent with the smoke of a fire fed in the common way, we cannot pretend to determine.

Besides this machine by Mr Defaguliers, the ventilators of Dr Hales, already mentioned, and those called *wind-sails*, are likewise used for the same purpose. The former of which is an improvement of the Hessian-bellows*: the other is a contrivance for throwing fresh air into those places where putrid air is apt to lodge; but this has the last-mentioned inconvenience in a much greater degree than any of the others, as the blast of fresh air throws out that which was rendered putrid by stagnation, in such a manner as to contaminate all around it. See *WIND-Sails*.

* See *Sut-* opposition *, and even when introduced by Dr Mead,

* See *Ventilator*.

Air-trunk
||
Air-shafts.

Air-Trunk, is also a contrivance by Doctor Hales to prevent the stagnation of putrid effluvia in jails, and other places where a great number of people are crowded together in a small space. It consists only of a long square trunk open at both ends; one of which is inserted into the ceiling of the room, the air of which is required to be kept pure; and the other extends a good way beyond the roof. Through this trunk a continued circulation is carried on: and the reason is, that the putrid effluvia which do so much mischief when collected, being much lighter than the pure atmosphere, arise to the top of the room; and, if they there find a vent, will continually go out through it. These effluvia arise in very considerable quantity, being calculated by the late D. Keil at no less than 39 ounces from one man in 24 hours.

These trunks were first made trial of by Mr Yeoman, over the House of Commons, where they were nine inches wide within; and over the Court of King's-bench in Westminster-hall, where they were six inches wide. They are sometimes made wider, and sometimes narrower: but the wider they are the longer they ought to be, more effectually to promote the ascent of the vapour. The reason why vapours of this kind ascend more swiftly through a long trunk than a short one, is, that the pressure of fluids is always according to their different depth, without regard to the diameter of their basis, or of the vessel which contains them; and, upon this principle, a gallon of water may be made to split a strong cask. See *HYDROSTATICS*. When the column of putrid effluvia is long and narrow, the difference between the column of atmosphere pressing on the upper end of the trunk, and that which presses on the lower end, is much greater than if the column of putrid effluvia was short and wide; and consequently the ascent is much swifter.—One pan of a single pair of scales, which was two inches in diameter, being held within one of these trunks over the House of Commons, the force of the ascending air made it rise so as to require four grains to restore the equilibrium, and this when there was no person in the house; but when it was full, no less than 12 grains were requisite to restore the equilibrium; which clearly shows that these trunks must be of real and very great efficacy.

Air-Pump, a machine by which the air contained in a proper vessel may be exhausted or drawn out. See the article *PNEUMATICS*.

Air-Sacs, in birds. See *COMPARATIVE ANATOMY*, chap. ii.

Air-Shafts, among miners, denote holes or shafts let down from the open air to meet the adits and furnish fresh air. The damps, want, and impurity of air which occur, when adits are wrought 30 or 40 fathoms long, make it necessary to let down air-shafts, in order to give the air liberty to play through the whole work, and thus discharge bad vapours, and furnish good air for respiration: the expence of which shafts, in regard of their vast depths, hardness of the rock, drawing of water, &c. sometimes equals, nay exceeds, the ordinary charge of the whole adit.

Sir Robert Murray describes a method, used in the coal-mines at Liege, of working mines without air-shafts.

When the miners at Mendip have sunk a groove, they will not be at the charge of an air-shaft till

they come at ore; and for the supply of air have boxes of elm exactly closed, of about six inches in the clear, by which they carry it down about twenty fathoms. They cut a trench at a little distance from the top of the groove, covering it with turf and rods disposed to receive the pipe, which they contrive to come in sideways to their groove, four feet from the top; which carries down the air to a great depth. When they come at ore, and need an air-shaft, they sink it four or five fathoms distant, according to the convenience of the breadth, and of the same fashion with the groove, to draw as well ore as air.

Air-Threads, in natural history, a name given to the long filaments, so frequently seen in autumn floating about in the air.

These threads are the work of spiders, especially of that species called the long-legged field-spider; which, having mounted to the summit of a bush or tree, darts from its tail several of these threads, till one is produced capable of supporting the creature in the air: on this it mounts in quest of prey, and frequently rises to a very considerable height. See *ARANEA*.

Air-Vessels, are spiral ducts in the leaves, &c. of plants, supposed to be analogous to the lungs of animals, in supplying the different parts of a plant with air. See the article *PLANTS*.

AIR, in mythology, was adored by the Heathens under the names of Jupiter and Juno; the former representing the superior and finer part of the atmosphere, and the latter the inferior and grosser part. The augurs also drew presages from the clouds, thunder, lightning, &c.

AIR, in painting, &c. denotes the manner and very life of action; or it is that which expresses the disposition of the agent.—It is sometimes also used in a synonymous sense with gesture or attitude.

AIR, in music, is taken in different senses. It is sometimes contrasted with harmony; and, in this sense, it is synonymous with melody in general.—Its proper meaning is, A tune, which is set to words, or to short pieces of poetry that are called *songs*.

In operas, we give the name of *air* to such pieces of music as are formed with measures and cadences, to distinguish it from the recitative; and, in general, every piece of music is called an *air*, which is formed for the voice, or even for instruments, and adapted to stanzas, whether it forms a whole in itself, or whether it can be detached from any whole of which it forms a part, and be executed alone.

If the subject admits of harmony, and is set in parts, the *air* is, according to their number, denominated a *duett*, a *trio*, a *quartetto*, &c. We need not follow Rousseau, and the other philologists, in their endeavours to investigate the etymon of the word *air*. Its derivation, though found and ascertained, would contribute little to illustrate its meaning in that remote sense, to which, through a long continuance of time, and the various vicissitudes of language, it has now passed. The curious may consult the same article in the *Dictionnaire de Musique* by M. Rousseau.

In modern music, there are several different kinds of *airs*, each of which agrees to a certain kind of dancing, and from these dances the *airs* themselves take their specific names.

The *airs* of our operas, are, if we may be permitted the

Air-threads
||
Air.

Air. the expression, the canvass or substratum upon which are painted all the pictures of imitative music; melody is the design, and harmony the colouring; every picturesque object selected from the most beautiful parts of nature, every reflected sentiment of the human heart, are the models which the artist imitates; whatever gains attention, whatever interests the soul, whatever charms the ear, or causes emotion in the heart, these are the objects of his imitation. See IMITATION. An air which delights the ear, and discovers the learning of the composer; an air invented by genius, and composed with taste; is the noblest effort of music: it is this which explores the compass, and displays the delicacy, of a beautiful voice; it is in this where the charms of a well-conducted symphony shine; it is by this, that the passions, excited and inflamed by nice gradations, reach and agitate the soul through the avenues of external sense. After hearing a beautiful *air*, the mind is acquiescent and serene: the ear is satisfied, not disgusted: it remains impressed on the fancy, it becomes a part of our essence, we carry it with us, we are able to repeat it at pleasure: without the ability acquired by habit to breathe a single note of it, we execute it in our imagination in the same manner as we heard it upon the theatre: one sees the scene, the actor, the theatre; one hears the accompaniments and the applauses. The real enthusiast in music never forgets the beautiful airs which he has heard; when he chooses, he causes the opera to recommence.

The words to which *airs* are adapted, are not always rehearsed in regular succession, nor spoken in the same manner with those of the recitative; and though, for ordinary, they are very short, yet they are interrupted, repeated, transposed, at the pleasure of the artist. They do not constitute a narrative, which once told is over: they either delineate a picture, which it is necessary to contemplate in different points of view; or inspire a sentiment in which the heart acquiesces with pleasure, and from which it is neither able nor willing to be disengaged; and the different phrases of the *air*, are nothing else but different manners of beholding the same image. This is the reason why the subject of an *air* should be one. It is by these repetitions properly placed, it is by these redoubled efforts, that an impression, which at first was not able to move you, at length shakes your soul, agitates you, transports you out of yourself: and it is likewise upon the same principle, that the runnings, as they are called, or those long, mazy, and inarticulated inflections of the voice, which, in pathetic *airs*, frequently seem, though they are not always so, improperly placed; whilst the heart is affected with a sentiment exquisitely moving, it often expresses its emotions by inarticulate sounds, more strongly and sensibly than it could do by words themselves.

The form of *airs* is of two kinds. The small airs are often composed of two strains, which ought each of them to be sung twice; but the important airs in operas are frequently in the form of rondeaus.

AIR, or *Ayr*, in geography, a town of Scotland, capital of an extensive county of the same name. It stands on the river Air, and was formerly a place of good trade, and seat of fisheries; all of which have vanished, and the people now live by one another. Air appears, from history and other documents, to have been a considerable place at the time of the Norman conquest. The vouchers

of its antiquity are corroborated by an elegant building, called the *Cross*, which hath escaped the destructive rage of the last and preceding century. The date on this fragment of antiquity is 1055, consequently it hath stood in its place above 730 years; and it is to be wished, that the majority of the inhabitants may unite in preserving it from being destroyed by persons who have expressed a strong desire to that purpose. In 1557, the tax levied upon Air was L. 236 Scots; upon Glasgow only L. 202. In 1771, Air was assessed at 15 s. Sterl. and Glasgow at L. 18, 10s. In 1751, the pickled herrings exported from Air were 6624 barrels; since the year 1777, none. These revolutions appear the more extraordinary, when we consider the very advantageous situation of Air both by land and water; the fertility of the country; the riches of the sea; its contiguity to the western fisheries on one side, and to Glasgow on the other; the large returns for cattle, grain, and coal; the ample revenues of the town; and particularly the conveniency of its harbour for fishing-vessels of every construction.—About a mile north from the town there is a lazaretto, commonly called *The King's Chapel*, which King Robert de Bruce set apart for the maintenance of lepers.

AIRA, in botany: A genus of the triandria digynia class; and in the natural method ranking under the 4th order, *Gramina*. The characters are: The *calyx* is a two-flowered double-valved glume: The *corolla* is two-valved, and no rudiment of a flower between the florets: The *stamina* consist of three capillary filaments the length of the flower; the antheræ are oblong, and forked at both ends: The *pisillum* is an egg-shaped germen; the styli are two, bristly, and expanding; the stigmata are pubescent: There is no *pericarpium*; the including corolla grows to the seed: The *seed* is egg-shaped and covered. There are 14 species of the *aira*, nine of which are natives of Britain. The English name is *Hair-grass*. See the general article **GRASS**.

AIRANI, in church-history, an obscure sect of Arians, in the fourth century, who denied the consubstantiality of the Holy Ghost with the Father and the Son. They are otherwise called *Airanists*; and are said to have taken their name from one *Airas*, who distinguished himself at the head of this party, in the reigns of Valentinian and Gratian.

AIRE, a town of France, in Proper Gascony, of which it is the capital, with a bishop's see. It is seated on the river Adour, on the declivity of a mountain. E. Long. 0. 3. N. Lat. 43. 47.

AIRE, a strong town in the Netherlands, in the county of Artois, with a castle. It was taken by the French in 1710, and was confirmed to them by the treaty of Utrecht. It is seated on the river Lis, 22 miles south of Dunkirk, and communicates with St Omer's by a canal cut from the river Aa. E. Long. 2. 31. N. Lat. 50. 38.

AIRING, a term peculiarly used for the exercising horses in the open air. It purifies the blood; purges the body from gross humours; and, as the jockies express it, teaches the horse how to make his wind rake equally, and keep time with the other motions of his body. It also sharpens the stomach, and keeps the creature hungry; which is a thing of great consequence, as hunters and racers are very apt to have their stomach fall off, either from want of exercise, or from the too violent exer-

Aira
||
Airing.

Airs
||
Ajuga.

exercise which they are often exposed to. If the horse be over fat, it is best to air him before sun-rise and after sun-setting; and in general, it is allowed by all, that nothing is more beneficial to those creatures than early and late airings. Some of our modern managers, however, dispute this: they say, that the cold of these times is too great for the creature; and that if, in particular, he is subject to cataracts, rheums, or the like complaints, the dews and cold fogs, in these early and late airings, will be apt to increase all those disorders. Nature, we see, also points out the sun-beams as of great use to these animals; those which are kept hardy and lie out all night, always running to those places where the sunshine comes, as soon as it appears in a morning. This should seem to recommend those airings that are to be made before sun-set, and a little time after sun-rise. As to the caution, so earnestly inculcated, by Markham, of using these early and late airings for fat horses, it is found unnecessary by many: for they say, that the same effect may be produced by airings at warmer times, provided only that they are made longer; and that, in general, it is from long airings that we are to expect to bring a horse to a perfect wind and sound courage.

AIRS, in the manege, are the artificial motions of taught horses; as the demivolt, curvet, capriole, &c.

AIRY, or AERY, among sportsmen, a term expressing the nest of a hawk or eagle.

AIRY *Triplicity*, among astrologers, denotes the three signs, gemini, libra, and aquarius.

AISNE, a river of France, which rises in Champeigne, and runs W. by Soissons in the Isle of France, falling into the river Oise, a little above Campeigne.

AITOCZU, a considerable river of Lesser Asia, which, arising in the mountain Taurus, falls into the south part of the Euxine sea.

AJUGA, BUGLE: A genus of the gymnospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 42d order, *Asperifolia*. The characters are: The *calyx* is a short perianthium, monophyllous and persistent: The *corolla* is monopetalous and grinning: The *stamina* consist of four erect tubulated filaments; the antheræ are dimidiated: The *pisillum* has a four-cleft germen, a filiform stylos, and two slender stigmata. There is no *pericarpium*; the calyx converging, and containing the seeds in its bosom: The *seeds* are four, and oblong. The

Species enumerated by Linnæus are, 1. The *orientalis*, with inverted flowers, which is a native of the east. 2. The *genevensis*, with woolly leaves and hairy cups, is a native of Swisserland and of the southern parts of Europe. 3. The *pyramidalis*, or mountain-bugle, with a square pyramidal spike and blue flowers, is a native of Sweden, Germany, Swisserland, and the hilly parts of Britain. Sheep and goats eat it; cows are not fond of it; horses and swine refuse it. 4. The *reptans*, common or pasture bugle, with creeping suckers, and blue, red, or white blossoms, in long leafy spikes, is a native of the southern parts of Europe, and is met with in woods and moist places in many parts of Britain. The roots are astrigent, and strike a black colour with vitriol of iron.

Culture. The first species is propagated by sowing the seeds soon after they are ripe, in a pot filled with loamy earth, and placed in a shady situation till autumn;

when it must be removed under a frame, and protected from the frosts. In the spring, after the plants are come up, let them be translated each into a separate pot, and in summer placed under a shady situation. The other sorts are easily propagated by their side-shoots, and succeed best in a moist shady situation.

AIUS LOCUTIUS, the name of a deity to whom the Romans erected an altar.—The words are Latin, and signify “a speaking voice.”—The following accident gave occasion to the Romans, erecting an altar to the Aius Locutius. One M. Seditius, a plebian, acquainted the tribunes, that, in walking the streets by night, he had heard a voice over the temple of Vesta, giving the Romans notice that the Gauls were coming against them. This intimation was however neglected; but after the truth was confirmed by the event, Camillus acknowledged this voice to be a new deity, and erected an altar to it under the name of the *Aius Locutius*.

AJUTAGE, or ADJUTAGE, a kind of tube fitted to the mouth of the vessel through which the water of a fountain is to be played. To the different form and structure of *ajutages*, is owing to the great variety of fountains. See FOUNTAIN and HYDROSTATICS.

AIX, a small, but ancient town in the duchy of Savoy, with the title of a marquisate. It is seated on the lake Bourget, at the foot of a mountain, between Chamberry, Annecy, and Rumilly. There is here a triumphal arch of the ancient Romans, but it is almost entirely ruined. The mineral waters bring a great number of strangers to this place. The place was originally called *Aque Gratiæ*, from the hot baths built there by the Emperor Gratian. E. Long. 7. 10. N. Lat. 45. 40.

AIX, an ancient city, the capital of Provence, in France. It is an archbishopric; and has a parliament, a court of aids, a chamber of accounts, a seneschal's jurisdiction, a generality, and an university. It has that air of silence and gloom so commonly characteristic of places destitute of commerce or industry: It is, however, a well-built city; and most like Paris of any place in the kingdom, as well for the largeness of the buildings, as in respect of the politeness of the inhabitants. It is embellished with abundance of fine fountains, and several beautiful squares. The preachers square is on the side of a hill; it is about 160 yards in length, and is surrounded with trees, and houses built with stone three stories high. The town-hall is at one end of the city, and is distributed into several fine apartments: the two lowest are taken up by the board of accounts, and by the seneschal; that above is designed for the sessions of parliament. The hall of audience is adorned with the pictures of the kings of France on horseback. The hotel of the city is a handsome building, but hid by the houses of the narrow street in which it is placed. The cathedral church is a Gothic structure, with tombs of several earls of Provence, and some good pictures by French masters. The Corse, or Orbitelle, is a magnificent walk, above 300 yards long, formed by a triple avenue of elms, and two rows of regular and stately houses. The church of the fathers of the oratory is a handsome building; and not far from thence is the chapel of the blue penitents, which is full of paintings. The convent of preachers is very fine; in their church is a silver statue of the Virgin Mary almost as big as the life. There are other churches and buildings

Aius
Locutius
||
Aix.

Aix. Buildings which contain a great number of rarities. The baths without the city, which were discovered not long since, have good buildings, raised at a vast expence, for the accommodation of those who drink the waters. Although Aix was the first Roman settlement in Gaul, it is not remarkable for ancient remains. The warm springs from which it is now known and frequented induced Sextus Calvinus to found a colony here, to which he gave the name of *Aque Sextie*. They were supposed to possess particular virtues in cases of debility; and several altars have been dug up sacred to Priapus, the inscriptions on which indicate their gratitude to that deity for his supposed succour and assistance. E. Long. 5. 32. N. Lat. 43. 32.

AIX, a small island on the coast of France, between the isle of Oleron and the continent. It is twelve miles north-west of Rochfort, and twelve south-west of Rochelle. W. Long. 1. 4. N. Lat. 46. 5.

AIX LA CHAPELLE, a fine city of Germany, in the circle of Westphalia and duchy of Juliers.

All authors are agreed about its antiquity, it being mentioned in Cæsar's Commentaries and the Annals of Tacitus. The Romans had colonies and fortresses there, when they were at war with the Germans; but the mineral waters and the hot bath so increased its fame, that, in process of time, it was advanced to the privileges of a city, by the name of *Aquægranii*, that is, the waters of Granius; that which it has now, of *Aix la Chapelle*, was given it by the French, to distinguish it from the other Aix. It is so called, on account of a chapel built in honour of the Holy Virgin by Charlemagne; who having repaired, beautified, and enlarged the city, which was destroyed by the Huns in the reign of Attila in 451, made it the usual place of his residence. The town is seated in a valley surrounded with mountains and woods, and yet the air is very wholesome. It may be divided into the inward and outward city. The inward is encompassed with a wall about three quarters of a league in circumference, having ten gates; and the outward wall, in which there are eleven gates, is about a league and a half in circumference. There are rivulets which run through the town and keep it very clean, turning several mills; besides twenty public fountains, and many private ones. They have stone-quarries in the neighbourhood, which furnish the inhabitants with proper materials for their magnificent buildings, of which the stadt-house and the cathedral are the chief. There are likewise thirty parochial or collegiate churches. The market-place is very spacious, and the houses round it are stately. In the middle, before the stadt-house, is a fountain of blue stones, which throws out water, from six pipes, into a marble basin placed beneath, thirty feet in circumference. On the top of this fountain, is placed the statue of Charlemagne, of brass, gilt, holding a sceptre in his right-hand, and a globe in his left. The stadt-house is adorned with the statues of all the emperors since Charlemagne. This fabric has three stories, the upper of which is one entire room of 162 feet in length and 60 in breadth. In this the new-elected emperor formerly entertained all the electors of the empire.

Aix la chapelle is a free imperial city, and changes its magistracy every year on the eve of St John Baptist. The mayor is in the nomination of the

elector palatine, in the quality of the duke of Juliers, as protector of the city. This place is famous for several councils and treaties of peace concluded here; particularly those between France and Spain in 1668, and between Great Britain and France in 1748.

The hot sulphurous waters for which this place has so long been celebrated, arise from several sources, which supply eight baths constructed in different parts of the town. These waters near the sources are clear and pellucid; and have a strong sulphureous smell resembling the washings of a foul gun; but they lose this smell by exposure to air. Their taste is saline, bitter, and urinous. They do not contain iron. They are also neutral near the fountain, but afterwards are manifestly and pretty strongly alkaline, inasmuch that clothes are washed with them without soap.—On the vaults above the springs and aqueducts of these waters is found, every year, when they are opened, a quantity of fine white-coloured flowers of sulphur, which has been sublimed from the waters.

The heat of the water of the hottest spring, by Dr Lucas's account, raises the quicksilver of Fahrenheit's thermometer to 136—by Monf. Monet's account, to 146—and the heat of the fountain, where they commonly drink, by Dr Lucas's account, to 112.

Dr Simmons has given the following account of their several temperatures, as repeatedly observed by himself with a thermometer constructed by Nairne.

The spring which supplies the Emperor's bath (<i>Bain de l'Empereur</i>), the New Bath (<i>Bain Neuf</i>), and the Queen of Hungary's bath (<i>Bain de la Reine Hongrie</i>),	- - -	127°
St Quirin's bath (<i>Bain de St Quirin</i>),	- - -	112°
The Rose bath (<i>Bain de la Rose</i>), and the Poor's bath (<i>Bain des Pauvres</i>), both which are supplied by the same spring,	- - -	112°
Charles's bath (<i>Bain de Charles</i>), and St Corneille's bath (<i>Bain de St Corneille</i>),	- - -	112°
The spring used for drinking is in the High Street, opposite to Charles's bath; the heat of it at the pump is.	- - -	106°

Dr Lucas evaporated the water of the hottest spring (of the Emperor's Bath), and obtained 268 grains of solid matter from a gallon, composed of 15 grains of calcareous earth, 10 grains of selenites, and 243 grains of a saline matter made up of natron and sea salt. They are at first nauseous and harsh, but by habit become familiar and agreeable. At first drinking, also, they generally affect the head. Their general operation is by stool and urine, without griping or diminution of strength; and they also promote perspiration.

The quantity to be drank as an alterative is to be varied according to the constitution and other circumstances of the patient. In general, it is best to begin with a quarter or half a pint in the morning, and increase the dose afterwards to pints, as may be found convenient. The water is best drank at the fountain. When it is required to purge, it should be drank in large and often-repeated draughts.

In regard to bathing, this also must be determined by the age, sex, strength, &c. of the patient, and by the season. The degree of heat of the bath should likewise be considered. The tepid ones are in general the best, though there are some cases in which the hotter ones are most proper. But even in these, it is best to begin

Aizoon, Akenfide. begin with the temperate baths, and increase the heat gradually.

These waters are efficacious in diseases proceeding from indigestion and from foulness of the stomach and bowels. In rheumatisms; in the scurvy, scrophula, and diseases of the skin; in hysterical and hypochondriacal disorders; in nervous complaints and melancholy; in the stone and gravel; in paralytic complaints; in those evils which follow an injudicious use of mercury; and in many other cases. They ought not, however, to be given in hectic cases where there is heat and fever, in putrid disorders, or where the blood is dissolved, or the constitution much broken down.

The time of drinking, in the first season, is from the beginning of May to the middle of June; and, in the latter season, from the middle of August to the latter end of September.

There are galleries or piazzas under which the company walk during the time of drinking, in order to promote the operation of the waters.—The poor's bath is free for every body, and is frequented by crowds of poor people.

It is scarcely necessary to add, that there are all kinds of amusements common to other places of public resort; but the shapers appear more splendid here than elsewhere, assuming titles, with an equipage suitable to them.—Aix la Chapelle is 21 miles from Spa, 6 from Liege, and 30 from Cologne. E. Long. 5. 48. N. Lat. 51. 55.

AIZOON, called by Mr Miller *sempervive*; though the name Aizoon has been by some writers applied to the house-leek, and also to the aloes: A genus of the pentagynia order, belonging to the icosandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The characters are: The *calyx* is a single-leaved perianthium, divided into five segments, and persistent: There is no *corolla*: The *stamina* consist of very numerous capillary filaments; the antheræ are simple: The *pisillum* has a five-cornered germen above, with five simple styli; and the stigmata are simple. The *pericarpium* is a bellied, retuse, five-cornered capsule, having five cells and five valves: The *seeds* are many and globular.—Linnæus mentions three species; the canariense, hispanicum, and paniculatum. The first is a native of the Canary islands, the second of Spain, and the third of the Cape of Good Hope. They may all be raised in this country on hot-beds; but as they are not remarkable either for beauty or any other property, it appears unnecessary to take further notice of them.

AKENSIDE (Mark), a physician, who published in Latin "A Treatise upon the Dysentery," in 1764, and a few pieces in the first volume of the "Medical Transactions" of the college of physicians, printed in 1768; but far better known, and to be distinguished chiefly hereafter, as a poet. He was born at Newcastle-upon-Tyne, November 9. 1721; and after being educated at the grammar-school in Newcastle, was sent to the universities of Edinburgh and Leyden; at which last he took his degree of Doctor in Physic. He was afterwards admitted by mandamus to the same degree at Cambridge; elected a fellow of the college of physicians, and one of the physicians at St Thomas's Hospital; and, upon the establishment of the queen's household, appointed one of the physicians to her majesty.

Nº 9.

That Dr Akenfide was able to acquire no other kind of celebrity than that of a scholar and a poet, is to be accounted for by the following particulars in his life and conduct, related by Sir John Hawkins.—Mr Dyson and he were fellow-students, the one of law and the other of physic, at Leyden; where, being of congenial tempers, a friendship commenced between them that lasted through their lives. They left the university at the same time, and both settled in London: Mr Dyson took to the bar, and being possessed of a handsome fortune, supported his friend while he was endeavouring to make himself known as a physician; but in a short time, having purchased of Mr Hardinge his place of clerk of the house of commons, he quitted Westminster-hall; and for the purpose of introducing Akenfide to acquaintance in an opulent neighbourhood near the town, bought a house at North-End, Hampstead; where they dwelt together during the summer-season, frequenting the long-room, and all clubs and assemblies of the inhabitants.

At these meetings, which, as they were not select, must be supposed to have consisted of such persons as usually meet for the purpose of gossiping, men of wealth, but of ordinary endowments, and able to talk of little else than news, and the occurrences of the day. Akenfide was for displaying those talents which had acquired him the reputation he enjoyed in other companies: but here they were of little use to him; on the contrary, they tended to engage him in disputes that betrayed him into a contempt of those that differed in opinion from him. It was found out that he was a man of low birth, and a dependent on Mr Dyson; circumstances that furnished those whom he offended with a ground of reproach, that reduced him to the necessity of asserting in terms that he was a gentleman.

Little could be done at Hampstead after matters had proceeded to this extremity: Mr Dyson parted with his villa at North-End, and settled his friend in a small house in Bloomsbury-square; assigning for his support such a part of his income as enabled him to keep a chariot.—In this new situation Akenfide used every endeavour to become popular, but defeated them all, by the high opinion he everywhere manifested of himself, and the little condescension he showed to men of inferior endowments; by his love of political controversy, his authoritative censure of the public councils, and his bigotted notions respecting government; subjects foreign to his profession, and with which some of the wisest of it have thought it prudent not to concern themselves. In the winter evenings he frequented Tom's coffee-house in Devereux-court, then the resort of some of the most eminent men for learning and ingenuity of the time; with some of whom he became entangled in disputes and altercations, chiefly on subjects of literature and politics, that fixed on his character the stamp of haughtiness and self-conceit, and drew him into disagreeable situations. Hence many, who admired him for his genius and parts, were shy of becoming his intimates.

The value of that precept which exhorts us to live peaceably with all men, or, in other words, to avoid creating enemies, can only be estimated by the reflection on those many amiable qualities against which the neglect of it will preponderate. Akenfide was a man of religion and strict virtue; a philosopher, a scholar,

Akenfide.

Akenfide
||
Akond.

and a fine poet. His conversation was of the most delightful kind; learned, instructive, and without any affectation of wit, cheerful and entertaining.

Dr Akenfide died of a putrid fever, June 23. 1770; and is buried in the parish-church of St James's, Westminster.

His poems, published soon after his death in 4to and 8vo, consist of "The Pleasures of Imagination," two books of "Odes," a "Hymn to the Naiads," and some "Inscriptions." "The Pleasures of Imagination," his capital work, was first published in 1744; and a very extraordinary production it was from a man who had not reached his 23d year. He was afterwards sensible, however, that it wanted revision and correction; and he went on revising and correcting it for several years: but finding this task to grow upon his hands, and despairing of ever executing it to his own satisfaction, he abandoned the purpose of correcting, and resolved to write the poem over anew upon a somewhat different and enlarged plan. He finished two books of his new poem, a few copies of which were printed for the use of the author and certain friends; of the first book in 1757, of the second in 1765. He finished also a good part of a third book, and an introduction to a fourth; but his most munificent and excellent friend, conceiving all that is executed of the new work, too inconsiderable to supply the place, and supersede the republication of the original poem, and yet too valuable to be withheld from the public, hath caused them both to be inserted in the collection of his poems.

AKIBA, a famous rabbin, flourished a little after the destruction of Jerusalem by Titus. He kept the flocks of a rich citizen of Jerusalem till the 40th year of his age, and then applied himself to study in the academies for 24 years; and was afterwards one of the greatest masters in Israel, he having 24,000 scholars. He declared for the impostor Barcochebas, whom he owned for the Messiah; and not only anointed him king, but took upon himself the office of his master of the horse. The troops which the emperor Hadrian sent against the Jews, who under the conduct of this false Messiah had committed horrid massacres, exterminated this faction. Akiba was taken, and put to death with great cruelty. He lived 120 years; and was buried with his wife in a cave upon a mountain not far from Tiberias, and his 24,000 scholars were buried round about him upon the same mountain. It is imagined he invented a supposititious work under the name of the patriarch Abraham.

AKISSAT, the ancient Thyatira, a city in Natio-
lia, in Asia, situated in a plain 18 miles broad, which produces plenty of cotton and grain. The inhabitants, who are reckoned to be about 5000, are said to be all Mahometans. The houses are built of nothing but earth or turf dried in the sun, and are very low and ill contrived: but there are six or seven mosques, which are all of marble. There are remarkable inscriptions on marble in several parts of the town, which are part of the ruins of ancient Thyatira. It is seated on the river Hermus, 50 miles from Pergamos. E. Long. 28. 30. N. Lat. 38. 50.

AKOND, an officer of justice in Persia, who takes cognizance of the causes of orphans and widows; of contracts, and other civil concerns. He is the head of

the school of law, and gives lectures to all the subaltern officers; he has his deputies in all the courts of the kingdom, who, with the second *sadra*, make all contracts.

Al
||
Alabaster.

AL, an Arabic particle prefixed to words, and signifying much the same with the English particle *the*: Thus they say, alkermes, alkoran, &c. i. e. the kermes, the koran, &c.

AL, or ALD, a Saxon term frequently prefixed to the names of places, denoting their antiquity; as Aldborough, Aldgate, &c.

ALA, a Latin term properly signifying a wing; from a resemblance to which several other things are called by the same name: Thus,

ALA, is a term used by botanists for the hollow of a stalk, which either the leaf, or the pedicle of the leaf, makes with it; or it is that hollow turning, or sinus, placed between the stalk or branch of a plant and the leaf, whence a new offspring usually issues. Sometimes it is used for those parts of leaves otherwise called *lobes*, or *wings*.

ALÆ (the plural number) is used to signify those petals or leaves of papilionaceous flowers, placed between those others which are called the *vexillum* and *carina*, and which make the top and bottom of the flowers. Instances of flowers of this structure are seen in those of pease and beans, in which the top leaf or petal is the *vexillum*, the bottom the *carina*, and the side ones the *alæ*.

ALÆ is also used for those extremely slender and membranaceous parts of some seeds, which appear as wings placed on them; it likewise signifies those membranaceous expansions running along the stems of some plants, which are therefore called *alated stalks*.

ALÆ, in anatomy, a term applied to the lobes of the liver, the cartilages of the nostril, &c.

ALÆ, in the Roman art of war, were the two wings or extreme parts of the army drawn up in order of battle.

ALABA, one of the three smallest districts of Biscay in Spain, but pretty fertile in rye, barley, and fruits. There are in it very good mines of iron, and it had formerly the title of a kingdom.

ALABANDA (anc. geog.), a town of Caria, near the Meander, situate beneath eminences resembling asses with pack-saddles, which gave rise to the jest; and between Amyzo to the west and Stratonice to the east. Under the Romans they enjoyed assises, or a convention of jurisdiction, by Pliny reckoned the fourth in order; hence the proverb in Stephanus, expressing their happiness. It was built by Alabandus, whom therefore they deemed a god. The people were called *Alabandi*, *Alabandenses*, Cicero; and *Alabandeis*, after the Greek manner, in coins of Augustus and Claudius; they were also called *Alabandeni* (Livy).

ALABARCHA, in antiquity, a kind of magistrate among the Jews of Alexandria, whom the emperors allowed them to elect, for the superintendency of their policy, and to decide differences and disputes which arose among them.

ALABASTER (William), an English divine, was born at Hadley in the county of Suffolk. He was one of the doctors of Trinity college in Cambridge; and he attended the earl of Essex as his chaplain in the expedition to Cadiz in the reign of queen Elizabeth. It

Alabaſter is ſaid, that his firſt reſolutions of changing his religion were occaſioned by his ſeeing the pomp of the churches of the Roman communion, and the reſpect with which the prieſts ſeemed to be treated amongſt them; and appearing thus to waver in his mind, he ſoon found perſons who took advantage of this diſpoſition of his, and of the complaints which he made of not being advanced according to his deſerts in England, in ſuch a manner, that he did not ſcruple to go over to the Popiſh religion, as ſoon as he found that there was no ground to hope for greater encouragement in his own country. However that matter is, he joined himſelf to the Romiſh communion, but was diſappointed in his expectations. He was ſoon diſpleaſed at this; he could not reconcile himſelf to the diſcipline of that church, which made no conſideration of the degrees which he had taken before. It is probable too that he could not approve of the worſhip of creatures, which proteſtants are uſed to look upon with horror. Upon this he returned to England, in order to reſume his former religion. He obtained a prebend in the cathedral of St Paul, and after that the rectorſhip of Therfield in Hertfordſhire. He was well ſkilled in the Hebrew tongue; but he gave a wrong turn to his genius by ſtudying the Cabala, with which he was ſtrangely inſatuated. He gave a proof of this in a ſermon which he preached upon taking his degree of doctor of divinity at Cambridge. He took for his text the beginning of the firſt book of Chronicles, Adam, Seth, Enos; and having touched upon the literal ſenſe, he turned immediately to the myſtical, aſſerting, that Adam ſignified miſfortune and miſery, and ſo of the reſt. His verſes were greatly eſteemed. He wrote a Latin tragedy, intitled *Roxana*; which, when it was acted in a college at Cambridge, was attended with a very remarkable accident. There was a lady who was ſo terrified at the laſt word of the tragedy, *Sequar, Sequar*, which was pronounced with a very ſhocking tone, that ſhe loſt her ſenſes all her lifetime after. Alabaſter was living in 1630. His *Apparatus in Revelationem Jeſu Chriſti* was printed at Antwerp in 1607. As for his *Spiraculum tubarum, ſeu ſons Spiritualium Expoſitionum ex equivocis Pentaglotti ſignificationibus*, and his *Ecce Sponſus venit, ſeu tuba pulchritudinis, hoc eſt demonſtratio quod non ſit illicitum nec impoſſibile computare durationem mundi & tempus ſecundi adventus Chriſti*, they were printed at London. We may judge from theſe titles what the taſte and genius of the author was.

ALABAſTER, in natural hiſtory, a ſpecies of that genus of ſtones whoſe baſe is calcareous earth. It differs from marble in being combined, not with the ærial, but with vitriolic acid; therefore, when mixed with any acid, no efferveſcence appears. It is ſoluble in about 500 times its weight of water at the temperature of 60. It is fuſible alone in a long-continued porcelain heat, or by the blow-pipe. Specific gravity 1.87. Texture granular, with ſhining particles. In compoſition, and conſequently in its chemical properties, it does not differ from gypſum, ſelenite, and plaſter of Paris.

There are three ſpecies of alabaſter. 1. The ſnow-white ſhining alabaſter, or lygdinum of the ancients, is found in Taurus, in pieces large enough to make diſhes, or the like. It cuts very freely, and is capable of a fine poliſh. 2. The yellowiſh alabaſter, or phen-

gites of Pliny, is found in Greece; and is of a ſoft looſe open texture, pretty heavy, and nearly of the colour of honey. This ſpecies has likewiſe been found in Germany, France, and in Derbyſhire in England. 3. Variegated, yellow, and reddiſh alabaſter. This ſpecies is the common alabaſter of the ancients, and is ſo ſoft that it may be cut with a knife: It is remarkably bright, and almoſt transparent; admits of a fine poliſh, and conſiſts of large angular ſparry concretions. It is not proof againſt water; it ferments violently with aqua-fortis, and burns to a pale yellow. The colour of this ſpecies is a clear pale yellow reſembling amber, and variegated with undulated veins; ſome of which are pale red, others whitiſh, and others of a pale brown. It was formerly brought from Egypt, but is now to be met with in ſeveral parts of England. The alabaſters are frequently uſed by ſtatuarics for ſmall ſtatues, vaſes, and columns. After being calcined and mixed with water, they may be caſt in any mould like plaſter of Paris. See GYPSUM.

Alabaſter, Mr Boyle obſerves, being finely powdered, and thus ſet in a baſon over the fire, will, when hot, aſſume the appearance of a fluid, by rolling in waves, yielding to the ſmalleſt touch, and emitting vapour; all which properties it loſes again on the departure of the heat, and diſcovers itſelf a mere incoherent powder. The fineneſs and clearneſs of this ſtone renders it in ſome meaſure transparent; whence it has been ſometimes alſo employed for windows. There is a church at Florence ſtill illuminated by alabaſter-windows; inſtead of panes of glaſs, there are ſlabs of alabaſter near 15 feet high, each of which forms a ſingle window, through which the light is conveyed. The countries in Europe which abound moſt in alabaſter are Germany, toward Coblentz; the province of Maconnois, in the neighbourhood of Cluni in France; Italy, toward Rome; where that of Montaiout is particularly remarkable not only for its whiteness, but alſo for the bigneſs of its blocks, ſome of which are ſo large, that ſtatues as big as the life may eaſily be cut out of them. F. Labat, in his journey to Italy, obſerves, that there are quarries of alabaſter in the neighbourhood of the village called de la Toffa, near Civita Vecchia: there is alſo alabaſter to be found in ſome places of Lorrain; but it is not much eſteemed. A new manufacture of baſſo relievos, from a ſingular ſpecies of factitious alabaſter, has been ſome time ago eſtabliſhed by M. Letapie, at the baths of St Philip in Tuscany. The ſteam at theſe baths depoſites a peculiar kind of ſand, which, when collected and condensed in the cavities of any body employed to oppoſe its current, acquires the nature, hardneſs, and colour of alabaſter, and aſſumes the forms of thoſe cavities in which it is thus lodged.

ALABAſTER, in antiquity, a term uſed for a vaſe wherein odoriferous liquors were anciently put. The reaſon of the denomination is, that veſſels for this purpoſe were frequently made of the alabaſter-ſtone, which Pliny and other ancients repreſent as peculiarly proper for this purpoſe. Several critics will have the box mentioned in the Gospels as made of alabaſter to have been of glaſs: And though the texts ſay that the woman broke it, yet the pieces ſeem miraculoſly to have been united, ſince we are told the entire box was purchaſed by the emperor Conſtantine, and preſerved as

Alaba-
strum
||
Alamandus

a relic of great price. Others will have it, that the name *alabaſter* denotes the form rather than the matter of this box: In this view they define alabaſter by a box without a handle, deriving the word from the primitive *a*, and *alaſtr*, *anſa*, *handle*.

Alabaſter is alſo ſaid to have been uſed for an ancient liquid meaſure, containing ten ounces of wine, or nine of oil. In this ſenſe, the alabaſter was equal to half the ſextary.

ALABAſTRUM DENDROIDE, a kind of laminated alabaſter, beautifully variegated with the figures of ſhrubs, trees, &c. found in great abundance in the province of Hohenſtein.

ALADINISTS, a ſect among the Mahometans, anſwering to free-thinkers among us.

ALADULIA, a conſiderable province of Turkey, in Aſia, in that part called Natolia, between the mountains of Antitaurus, which ſeparate it from Amaſia on the north, and from Carimania on the weſt. It has the Mediterranean ſea on the ſouth; and the Euphrates, or Frat, on the eaſt, which divides it from Diarbeker. It comprehends the Leſſer Armenia of the ancients, and the eaſt part of Cilicia. Formerly it had kings of its own; but the head of the laſt king was cut off by Selim I. emperor of the Turks, who had conquered the country. It is now divided into two parts: the north, comprehended between Taurus, Antitaurus, and the Euphrates, is a beglerbeglic, which bears the name of Marafh, the capital town; and the ſouth, ſeated between mount Taurus and the Mediterranean, is united to the beglerbeglic of Aleppo. The country is rough, ragged, and mountainous; yet there are good paſtures, and plenty of horſes and camels. The people are hardy and thieviſh. The capital is Malatigah.

ALAIN (Chartier), ſecretary to Charles VII. king of France, born in the year 1386. He was the author of ſeveral works in proſe and verſe; but his moſt famous performance was his Chronicle of King Charles VII. Bernard de Girard, in his preface to the Hiſtory of France, ſtyles him “an excellent hiſtorian, who has given an account of all the affairs, particulars, ceremonies, ſpeeches, anſwers, and circumſtances, at which he was preſent himſelf; or had information of.” Giles Coroxet tells us, that Margaret, daughter to the king of Scotland, and wife to the dauphin, paſſing once through a hall where Alain lay aſleep, ſhe ſtopped and kiſſed him before all the company who attended: ſome of them telling her, that it was ſtrange ſhe ſhould kiſs a man who had ſo few charms in his perſon, ſhe replied, “I did not kiſs the man, but the mouth from whence proceed ſo many excellent ſayings, ſo many wiſe diſcourſes, and ſo many elegant expreſſions.” Mr Fontenelle, among his Dialogues of the Dead, has one upon this incident, between the princeſs Margaret and Plato. Mr Paſquier compares Alain to Seneca, on account of the great number of beautiful ſentences interſperſed throughout his writings.

ALAIS, a conſiderable town of France, in the province of Languedoc, ſituated on the river Gardon, at the foot of the Cevennes. The Jeſuits had a college in this place; and a fort was built here in 1689. It is 34 miles north of Montpellier, and 340 from Paris. E. Lon. 4. 20. N. Lat. 44. 8.

ALAMANDUS (Lewis) in French *Aleman*, arch-biſhop of Arles, and cardinal of St Cecilia, was one of

the greateſt men of the fifteenth century. The cardinal preſided in the council of Baſil, which depoſed Eugenius IV. and elected the antipope Felix V. He is much commended by Æneas Sylvius, as a man extremely well formed for preſiding in ſuch aſſemblies, firm and vigorous, illuſtrious by his virtue, learned, and of an admirable memory in recapitulating all that the orators and diſputants had ſaid. One day, when he harangued againſt the ſuperiority of the pope over the council, he diſtinguiſhed himſelf in ſuch an eminent manner, that ſeveral perſons went to kiſs him, while others preſſed even to kiſs his robe. They extolled to the ſkies his abilities and genius, which had raiſed him, though a Frenchman, to a ſuperiority over the Italians, notwithstanding all their natural ſubtlety and fineſſe. There is no need of aſking, whether Pope Eugenius thundered againſt the preſident of a council which depoſed him. He deprived him of all his dignities, and treated him as a ſon of iniquity. However, notwithstanding this, Lewis Alamandus died in the odour of ſanctity, and performed ſo many miracles after his death, that at the requeſt of the canons and Celeſtine monks of Avignon, and the ſolicitation of the cardinal of Clermont legate *a latere* of Clement VII. he was beatified by that pope in the year 1527.

ALAMANNI (Lewis) was born at Florence, of a noble family, on the 28th of October 1495. He was obliged to fly his country for a conſpiracy againſt Julius de Medici, who was ſoon after choſen pope under the name of Clement VII. During this voluntary baniſhment, he went into France; where Francis I. from a love to his genius and merit, became his patron. This prince employed him in ſeveral important affairs, and honoured him with the collar of the order of St. Michael. About the year 1540, he was admitted a member of the Inſtammati, an academy newly erected at Padua, chiefly by Daniel Barbaro and Ugolin Martelli. After the death of Francis, Henry duke of Orleans, who ſucceeded him in 1537, ſhewed no leſs favour to Alamanni; and in the year 1551, ſent him as his ambaffador to Genoa: this was his laſt journey to Italy; and being returned to France, he died at Amboiſe on the 18th of April 1556, being in the 61ſt year of his age. He left many beautiful poems, and other valuable performances, in the Italian language. We have alſo ſome notes of his upon Homer's Iliad and Odyſſey; thoſe upon the Iliad were printed in the Cambridge edition of Homer in 1689, and Joſhua Barnes has alſo inſerted them in his fine edition of Homer in 1711.

ALAMODALITY, in a general ſenſe, is the accommodating a perſon's behaviour, dreſs, and actions, to the prevailing taſte of the country or times in which he lives.

ALAMODALITY of writing, is defined the accommodation of mental productions, both as to the choice of ſubject and the manner of treating it, to the genius or taſte of the times, in order to render them more acceptable to the readers.

ALAMODE, a phraſe originally French, importing a thing to be in the faſhion or mode. The phraſe has been adopted not only into ſeveral of the living languages, as the Engliſh and High-Dutch, but ſome have even taken it into the Latin. Hence we meet with *Alamodicus* and *Alamodalitas*.

Alamanni
||
Alamode.

Alamode
||
Aland.

ALAMODE, in commerce, a thin glossy black silk, chiefly used for womens hoods and mens mourning scarfs.

ALAMOS (Balthasar), a Spanish writer, born at Medina del Campo in Castile. After having studied the law at Salamanca, he entered into the service of Anthony Perez, secretary of state under Philip II. He was in high esteem and confidence with his master, upon which account he was imprisoned after the disgrace of this minister. He was kept in confinement 11 years, when Philip III. coming to the throne, set him at liberty, according to the orders given by his father in his will. Alamos continued in a private capacity, till the duke of Olivarez, the favourite of Philip IV. called him to public employments. He was a man of wit as well as judgment, but his pen was superior to his tongue. He died in the 88th year of his age. His panisfa translation of Tacitus, and the aphorisms which he added in the margin, gained him great reputation. This work was published at Madrid in 1614; and was to have been followed, as mentioned in the king's privilege, with a commentary, which however has never yet appeared. The author composed the whole during his imprisonment.

ALAN (Cardinal William), was born at Rossal in Lancashire, in the year 1532. He went to Oxford at the age of 15, and in 1550 was elected fellow of Oriel college. In 1556, being then only 24 years old, he was chosen principal of St Mary's hall, and one of the professors of the university. In 1558 he was made canon of York; but, upon queen Elizabeth's accession to the throne, he left England, and settled at Louvain in an English college, of which he became the chief support. In 1565 he visited his native country; but, on account of his extreme activity in the propagation of the Roman Catholic religion, he was obliged to fly the kingdom in 1568. He went first to Mechlin, and then to Doway, where he was made doctor of divinity. Soon after, he was appointed canon of Cambray, and then canon of Rheims. He was created cardinal on the 28th of July 1587, by the title of *St Martin in Montibus*; and obtained from the king of Spain a rich abbey in the kingdom of Naples, and afterwards the bishoprick of Mechlin. It is supposed to have been by the advice and instigation of this priest, that Philip II. attempted to invade England. He died on the 20th of October 1594, aged 63; and was buried in the English college at Rome. He was a man of considerable learning, and an elegant writer. He wrote many books in defence of the Romish religion. The most remarkable are, 1. *A defence of the 12 martyrs in one year*. Tho. Alfield was hanged for bringing, and publishing, this and other of Alan's works, into England, in the year 1584. 2. *A declaration of the sentence of Sextus V. &c.* A work intended to explain the pope's bull for the excommunication of queen Elizabeth, and to exhort the people of England to take up arms in favour of the Spaniards. Many thousand copies of this book, printed at Antwerp, were put on board the Armada; but the enterprise failing, they were afterwards destroyed. 3. *Of the worship due to saints and their relicts* 1583. This treatise was answered by Lord Burleigh, and is esteemed the most elegant of the Cardinal's writings.

ALAND, an island of the Baltic sea, between

Sweden and Finland, subject to the former. It lies between 17 and 19 degrees of E. long. and between 59 and 61 degrees of Lat. at the entrance of the gulph of Bothnia.

Alaraf
||
Alascani.

ALARAF, in the Mahometan theology, the partition wall that separates heaven from hell. The word is plural, and properly written *al araf*; in the singular it is written *al arf*. It is derived from the Arabic verb *arafa*, to distinguish. Al araf gives the denomination to the seventh chapter of the alcoran, wherein mention is made of this wall. Mahomet seems to have copied his al araf, either from the great gulf of separation mentioned in the New Testament, or from the Jewish writers, who also speak of a thin wall dividing heaven from hell. Mahometan writers differ extremely as to the persons who are to be found on al araf. Some take it for a sort of limbus for the patriarchs, prophets, &c. others place here such whose good and evil works so exactly balance each other, that they deserve neither reward nor punishment. Others imagine this intermediate space to be possessed by those who, going to war without their parents leave, and suffering martyrdom there, are excluded paradise for their disobedience, yet escape hell because they are martyrs.

ALARBES, a name given to those Arabians who live in tents, and distinguish themselves by their dress from the others who live in towns.

ALARES, in Roman antiquity, an epithet given to the cavalry, on account of their being placed in the two wings of the army.

ALARIC, a famous general of the Goths. He entered Thrace at the head of 200,000 men, and laid waste all the country through which he passed. He marched next to Macedonia and Thessaly: the Thessalians met him near the mouth of the river Peneas, and killed about 3000 of his army; nevertheless he advanced into Greece, and after having ravaged the whole country, returned to Epirus, loaded with immense spoils. After staying here five years, he resolved to turn his arms to the west. He marched through Pannonia; and, finding little resistance, entered Italy, under the consulship of Stilicho and Aurelianus, A. D. 400. After various battles and treaties, he at last took Rome by treachery, and permitted his soldiers to plunder it; this happened A. D. 409. Alaric, having laid waste a great part of Italy, intended to pass into Sicily; but a storm obliging him to land again, he besieged the city of Cosenza; and having took it, he died there in 411, eleven years after he first entered Italy.

ALARM, in the military art, denotes either the apprehension of being suddenly attacked; or the notice thereof, signified by firing a cannon, firelock, or the like. - False alarms are frequently made use of, to harass the enemy, by keeping them constantly under arms. Sometimes also this method is taken to try the vigilance of the piquet-guard, and what might be expected from them in case of real danger.

ALARM-Bell, that rung upon any sudden emergency, as a fire, mutiny, or the like.

ALARM-Post, or ALARM-place, the ground for drawing up each regiment in case of an alarm. This is otherwise called *the rendezvous*.

ALARM, in fencing, is the same with what is otherwise called an appeal, or challenge.

ALASCANI, in church-history, a sect of Antilutherans.

Alasco
||
Alauda.

therans, whose distinguishing tenet, besides their denying baptism, is said to have been this, that the words, *This is my body*, in the institution of the eucharist, are not to be understood of the bread, but of the whole action, or celebration of the supper. They are said to have taken the name from one Joannes a Lasco, a Polish baron, superintendant of the church of that country, in England. See the next article.

ALASCO (John), a Polish nobleman of the 16th century, who, imbibing the reformed opinions, was expelled his country, and became preacher to a Protestant congregation at Embden; but foreseeing persecution there, came to England about the year 1551, while the reformation was carrying on under Edward the VI. The publication of the Interim driving the Protestants to such places as afforded them toleration, 380 were naturalized here, and obtained a charter of incorporation, by which they were erected into an ecclesiastical establishment, independent on the church of England. The Augustine friars church was granted them, with the revenues, for the maintenance of Alasco as superintendant, with four assistant ministers, who were to be approved by the king: and this congregation lived undisturbed until the accession of Queen Mary, when they were all sent away. They were kindly received and permitted to settle at Embden; and Alasco at last, after an absence of 20 years, by the favour of Sigismund, returned to his own country, where he died in 1560. Alasco was much esteemed by Erasmus, and the historians of his time speak greatly in his praise: we have of his writing, *De Cæna Domini liber; Epistola continens summam Controversiæ de Cæna Domini, &c.* He had some particular tenets; and his followers are called *Alascani* in church-history.

ALATAMAHA, a large river of North America, which, rising in the Apalachian mountains, runs south-east through the province of Georgia, and falls into the Atlantic ocean, below the town of Frederica.

ALATERNUS, in botany, the trivial name of a species of the rhamnus. See RHAMNUS.

ALAVA, a district of Spain, about 20 miles in length, and 17 in breadth, containing very good iron-mines. Victoria is the capital town.

ALAUDA, or LARK, in ornithology, a genus of birds of the order of passeres; the characters of which are these: The beak is cylindrical, subulated, straight; and the two mandibles or chaps are of equal size. The tongue is bifid, and the hinder claw is straight, and longer than the toe. There are 28 species of the alauda, of which the following are the most remarkable. 1. The arvensis, or common sky-lark. This and the wood-lark are the only birds that sing as they fly; this raising its note as it soars, and lowering it till it quite dies away as it descends. It will often soar to such a height, that we are charmed with the music when we lose sight of the songster; it also begins its song before the earliest dawn. Milton, in his *Allegro*, most beautifully expresses these circumstances; and bishop Newton observes, that the beautiful scene that Milton exhibits of rural cheerfulness, at the same time gives us a fine picture of the regularity of his life, and the innocency of his own mind: thus he describes himself as in a situation

To hear the lark begin his flight,
And singing startle the dull night,

From his watch-tow'r in the skies,
Till the dappled dawn doth rise.

Alauda.

It continues its harmony several months, beginning early in the spring, on pairing. In the winter they assemble in vast flocks, grow very fat, and are taken in great numbers for our tables. They build their nest on the ground, beneath some clod, forming it of hay, dry fibres, &c. and lay four or five eggs.—The place these birds are taken in the greatest quantity, is the neighbourhood of Dunstable: the season begins about the 14th of September, and ends the 25th of February; and during that space, about 4000 dozen are caught, which supply the markets of the metropolis. See *BIRD-Catching*. Vastly greater numbers than the above, however, are at times caught in different parts of Germany, where there is an excise upon them. Keyser says, that the excise alone produces 6000 dollars (about L. 900 Sterling) every year to the city of Leipsic; whose larks are famous all over Germany as having the most delicate flavour. But it is not only at Leipsic that they are taken in such numbers, but also in the country about Naumburg, Merseburg, Halle, and other parts.—2. The pratensis, or tit-lark, has the two outward feathers of the wing edged with white, and frequents the meadows. It is found frequently in low marshy grounds: like other larks, it builds its nest among the grass, and lays five or six eggs. Like the wood-lark, it sits on trees; and has a most remarkable fine note, singing in all situations, on trees, on the ground, while it is sporting in the air, and particularly in its descent. This bird, with many others, such as the thrush, black-bird, willow-wren, &c. become silent about midsummer, and resume their notes in September: hence the interval is the most mute of the year's three vocal seasons, spring, summer, and autumn. Perhaps the birds are induced to sing again as the autumnal temperament resembles the vernal.—3. The arborea, or wood-lark, is a native of Europe, and is distinguished by an annular white fillet about the head. It is inferior in size to the sky-lark, and is of a shorter thicker form; the colours are paler, and its note is less sonorous and less varied, though not less sweet. It perches on trees, and whistles like the black-bird. It will sing in the night; and, like the common lark, will sing as it flies. It builds on the ground, and makes its nest on the outside with moss, within of dried bents, lined with a few hairs. It lays five eggs, dusky and blotched with deep brown marks, darkest at the thicker end. The males of this and the last are known from the females by their superior size. But this species is not near so numerous as that of the common kind.—4. The campestris, has one half of its chief feathers of the wings brown, except two in the middle which are white, and the throat and breast are yellowish.—5. The trivialis, whose chief feathers on the tail are brown, only half of the outermost is white, and the second is white at the end, in the shape of a wedge; there is likewise a double whitish line on the wings. It is a native of Sweden, and perches on the top of trees.—6. The cristata: the chief tail-feathers are black, but the two outermost are edged with white, and the head is crested. It is a native of Europe. It sings well, like the sky-lark; lays four or five eggs; and is said to hatch twice in a year.—7. The spinoletta: the chief tail-feathers are black,

only.

Alauda
||
Alay.

only the outermost two are obliquely half white. It is a native of Italy.—8. The alpestris: the chief wing-feathers are half white, the throat yellow, and it has a black streak under the eyes and on the breast. It inhabits North America, where it is migratory. It visits the neighbourhood of Albany the beginning of May, but goes farther north to breed. In winter it comes in vast flocks into Virginia and Carolina, returning North in spring. It feeds, during its stay in the more southern parts, on oats and other grain; and while at Albany, on the grass and the buds of sprig-birch. It runs into holes; whence the natives of these last parts have given it the name of *chi-chup-pi-sue*. The English call it the *ortalon*, and reckon it delicious eating. By some it is called *snow bird*, as being very plenty in that season. It is frequently caught in great numbers by means of horse-hair springes placed in some bare place, the snow being scraped away, and a little chaff strewed about. It is always seen on the ground, and has little or no song. This bird is not peculiar to North America: we hear of it in Germany also; and is in plenty throughout Russia and Siberia, going northward in spring.—9. The magna, is yellow on the belly, with a crooked black streak on the breast, and the three side-feathers of the tail white. It is a native of Africa and America.—10. The New Zealand lark (Plate XVI.) is seven and a half inches in length: the bill is half an inch, of a pale ash-colour, with the upper part black: the upper parts of the body are dusky, edged with pale ash-colour: the breast and belly are white: the legs reddish ash-colour, and the claws black. It inhabits Charlotte Sound, and is called *kogoo aroure*.

ALAUTA, a considerable river of Turkey in Europe, which, after watering the north-east part of Transylvania and part of Wallachia, falls into the Danube almost opposite to Nicopolis.

ALAY, signifying in the Turkish language "The Triumph," a ceremony which accompanies the assembling together the forces of that vast empire upon the breaking out of a war. It consists of the most insipid buffoonery, and is attended with acts of the most shocking barbarity. That which took place upon occasion of the late war between the Porte and Russia is described by Baron Tott in his Memoirs as follows.

"It consists in a kind of masquerade, in which each trade successively presents to the spectators the mechanical exercise of its respective art. The labourer draws his plough, the weaver handles his shuttle, the joiner his plane; and these different characters, seated in cars richly ornamented, commence the procession, and precede the standard of Mahomet, when it is brought out of the seraglio to be carried to the army, in order to insure victory to the Ottoman troops.

"This banner of the Turks, which they name *Sandjak-Cheriff*, or The Standard of the Prophet, is so revered among them, that, notwithstanding its reputation has been so often tarnished, it still retains their implicit confidence, and is the sacred signal unto which they rally. Every thing proclaims its sanctity. None but the emirs are allowed to touch it; they are its guards, and it is carried by their chief. The Mussulmen alone are permitted to look upon it. If touched by other hands, it would be defiled; if seen by

other eyes, profaned. In short, it is encompassed by the most barbarous fanaticism.

"A long peace had unfortunately caused the ridiculousness, and especially the danger, of this ceremony to be forgotten. The Christians imprudently crowded to see it; and the Turks, who, by the situation of their houses, could make money of their windows, began to profit by the advantage; when an emir, who preceded the banner, proclaimed with a loud voice, 'Let no infidel dare to profane with his presence the holy standard of the prophet; and let every Mussulman who perceives an unbeliever make it known under pain of reprobation.'

"From that moment no asylum was to be found; even those became informers, who, by letting out their houses, had rendered themselves accomplices in the crime. A religious fury seized on every mind, and put arms in every hand; the more atrocious the cruelty, the more was it meritorious. No regard was paid to sex or age; pregnant women, dragged by the hair, and trodden under feet by the multitude, perished in the most deplorable manner. Nothing was respected by these monsters; and under such auspices the Turks commenced the war."

ALB, or ALBE, in the Romish church, a vestment of white linen hanging down to the feet, and answering to the surplice of the English clergy. In the ancient church, it was usual, with those newly baptized, to wear an alb, or white vestment; and hence the Sunday after Easter was called *dominica in albis*, on account of the albs worn by those baptized on easter-day.

ALB is also a name of a Turkish coin, otherwise called *asper*. See ASPER.

ALBA (anc. geog.), a town of the Marfi in Italy, situated on the north-side of the Lacus Fucinus, still retaining in its name. It stands upon an eminence, and is noted in Roman history for being the state prison where captive princes were shut up, after being barbarously dragged through the streets of Rome at the chariot wheels of a triumphant consul. Perseus king of Macedon terminated his wretched career in this confinement, with his son, the last hope of an illustrious line of kings. Syphax the Numidian, and Bituinus king of the Averni, were also condemned to this goal by the particular clemency of the senate, which sometimes indulged its savage disposition by putting its captives to death.

Alba being situated in the centre of Italy, amidst difficult mountainous passes, and far from all means of escape, was esteemed a most proper place for the purpose of guarding prisoners of importance. Artificial strength was added to its natural security by fortifications, which remain to this day in a state that proves their ancient solidity. For the entertainment of the garrison, which was required in a place of such consequence, an amphitheatre was erected, of which the ruins are still valuable, as well as the foundations of a temple, and other buildings of Roman times.

Lucius Vitellius, brother to the emperor of that name, had a villa near this place, famous for the variety and excellence of its fruit-trees, which he had brought from Syria. His gardens were the nurseries where several of the most delicious stone-fruits, that are now so common in Europe, were first cultivated and multiplied.

Alb,
Alba.

Alba
||
Alban.

It must have been necessary at Alba to shelter trees transplanted from Asia, and to treat them with great tenderness and care, in order to rear them to perfection: for the climate of this high region is extremely rigorous in winter; the cold season lasts long, and is accompanied with violent storms of wind and falls of snow. The lake has been often frozen entirely over.

ALBA Firma, or *Album*, in our old customs, denoted rent paid in silver, and not in corn, which was called *black-mail*.

ALBA Terra, one of the numerous names for the philosopher's stone.

ALBA Regalis. See *STUL WEISSENBURGH*.

ALBA Helviorum, or *Albaugusta*, (anc. geog.), afterwards called *Vivarium*, now *Viviers*, in the south-east of Languedoc, on the Rhone. In the lower age the inhabitants were called *Albanenses*, and their city *Civitas Albanensium*, in the *Notitia Galliarum*. E. Long. 4. 45. Lat. 44. 50.

ALBA Julia (anc. geog.), now *Weissenburg*, a town of Transylvania, on the river Marisus, or Merisch, to the west of Hermanstadt, supposed to be called *Alba Julia*, after Julia Donna the mother of Caracalla. There are, however, several inscriptions found at or near Weissenburg, which bear *COL. APUL.* that is *Colonia Apulensis*, without the least mention of *Alba Julia*, though inscribed after Caracalla's time. Add, that Ulpian, reciting the colonies of Dacia, calls this colony *Apulensis*, and neither *Alba* nor *Julia*. Whence there is a suspicion, that *Alba Julia* is a corruption of *Apulum*. It was also called *Apulum Augustum*. E. Long. 25. 0. Lat. 46. 46.

ALBA Longa (anc. geog.), a colony from Lavinium, in Latium, established by Afcanius the son of Æneas, at the foot of the Mons Albanus: called *Alba*, from a white sow found by Æneas, which farrowed 30 white pigs on that spot; which circumstance was interpreted to portend the building of a city there in 30 years after (Propertius). The epithet *Longa* was added on account of its length. It was the royal residence till the building of Rome, as was foretold by Anchises (Virgil); was destroyed by Tullius Hostilius, all but the fane or temple; and the inhabitants were transplanted to Rome (Strabo).

ALBA Pompeia (anc. geog.), on the river Ceba, now *Ceva*, in Liguria, the birth-place of the emperor Pertinax; a colony either established at first by Pompey, or re-established by him after having been before settled by Scipio. The inhabitants were called *Albanenses Pompeiani*. At this day the town is simply called *Alba*, without any epithet.

ALBAHURIM, *figura sexdecim laterum*, a figure of great importance according to astrological physicians, who built their prognostics on it.

ALBAN (St) is said to have been the first person who suffered martyrdom for Christianity in Britain; he is therefore usually styled the protomartyr of this island. He was born at Verulam, and flourished towards the end of the third century. In his youth he took a journey to Rome, in company with Amphibalus a monk of Caerleon, and served seven years as a soldier under the emperor Dioclesian. At his return home, he settled in Verulam; and, through the example and instructions of Amphibalus, renounced the errors of paganism, in which he had been educated, and

became a convert to the Christian religion. It is generally agreed, that Alban suffered martyrdom during the great persecution under the reign of Dioclesian; but authors differ as to the year when it happened: Bede and others fix it in 286; some refer it to the year 296; but Usserius reckons it amongst the events of 303. The story and circumstances relating to his martyrdom, according to Bede, are as follows. Being yet a pagan (or at least it not being known that he was a Christian), he entertained Amphibalus in his house. The Roman governor being informed thereof, sent a party of soldiers to apprehend Amphibalus; but Alban, putting on the habit of his guest, presented himself in his stead, and was carried before that magistrate. The governor having asked him of what family he was? Alban replied, "To what purpose do you inquire of my family? if you would know my religion, I am a Christian." Then being asked his name, he answered, "My name is Alban; and I worship the only true and living God, who created all things." The magistrate replied, "If you would enjoy the happiness of eternal life, delay not to sacrifice to the great gods." Alban answered, "The sacrifices you offer are made to devils; neither can they help the needy, or grant the petitions of their votaries." His behaviour so enraged the governor, that he ordered him immediately to be beheaded. In his way to execution, he was stopped by a river, over which was a bridge so thronged with spectators that it was impossible to cross it; the faint, as we are told, lifted up his eyes to heaven, and the stream was miraculously divided, and afforded a passage for himself and a thousand more persons. Bede does not indeed give us the name of this river; but, notwithstanding this omission, the miracle, we suppose, will not be the less believed. This wonderful event converted the executioner upon the spot, who threw away his drawn sword, and, falling at St Alban's feet, desired he might have the honour to die with him. This sudden conversion of the headman occasioning a delay in the execution till another person could be got to perform the office, St Alban walked up to a neighbouring hill, where he prayed for water to quench his thirst, and a fountain of water sprung up under his feet: here he was beheaded, on the 23d of June. The executioner is said to have been a signal example of divine vengeance; for as soon as he gave the fatal stroke, his eyes dropt out of his head. We may see the opinion of Mr Milton in regard to this narrative, in his History of England. His words are these, speaking of St Alban, "The story of whose martyrdom, soiled and worse martyred with the fabling zeal of some idle fancies, more fond of miracles than apprehensive of the truth, deserves no longer digression." Between

4 or 500 years after St Alban's death, Offa, king of the Mercians, built a very large and stately monastery to his memory; and the town of St Albans in Hertfordshire takes its name from our protomartyr.

ALBANA (anc. geog.), a sea-port town of Albania, on the Caspian sea, between the rivers Casius and Albanus; now called *Bachu*, or *Bachy*, giving name to the Caspian sea, viz. *Mar de Babu*. E. Long. 49. 0. Lat. 40. 0.

ALBANENSES, in church-history, the same with *Albigenes*, according to some; according to others, different. Those, however, who are for distinguishing them.

Alban
||
Albanenses.

Albani.

them, attribute the same opinions to both; only making the Albanenses to have been prior in respect of time, as having been found towards the close of the eighth century; whereas the Albigenfes appeared not till the twelfth. See ALBIGENSES.

ALBANI, in Roman antiquity, a college of the *falii*, or priests of Mars; so called from mount Albanus, the place of their residence. See SALII.

ALBANI (Francis), a celebrated painter, born in Bologna, March 17, 1578. His father was a silk merchant, and intended to bring up his son to that business; but Albani having a strong inclination to painting, when his father died, devoted himself entirely to that art, though then but twelve years of age. He first studied under Denys Calvert; Guido Rheni being at the same time under this master, with whom Albani contracted a very great friendship. Calvert drew but one profile for Albani, and afterwards left him entirely to the care of Guido; under whom he made great improvement, his fellow-disciple instructing him with the utmost humanity and good humour. He followed Guido to the school of the Caraches: but a little after their friendship for each other began to cool; which was owing perhaps to the pride of Albani, who could not bear to see Guido surpass him, or to the jealousy of Guido at finding Albani make so swift a progress. They certainly endeavoured to eclipse one another; for when Guido had set up a beautiful altar-piece, Albani would oppose to it some fine picture of his: thus did they behave for some time, and yet spoke of each other with the highest esteem. Albani, after having greatly improved himself under the Caraches, went to Rome, where he continued many years, and married in that city; but his wife dying in childbed, at the earnest request of his relations he returned to Bologna, where he entered again into the state of matrimony. His second wife (Doralice) was well descended, but had very little fortune; which he perfectly disregarded, so strongly was he captivated with her beauty and good sense. Albani, besides the satisfaction of possessing an accomplished wife, reaped likewise the advantage of having a most beautiful model; so that he had now no occasion to make use of any other woman to paint a Venus, the Graces, Nymphs, and other deities, whom he took a particular delight in representing. His wife answered this purpose admirably well; for besides her bloom of youth, and the beauty of her person, he discovered in her so much modesty, so many graces and perfections, so well adapted to painting, that it was impossible for him to meet with a more finished woman. She afterwards brought him several boys, all extremely beautiful and finely proportioned; so that she and her children were the originals of his most agreeable and graceful compositions. Doralice was so conformable to his intentions, that she took a pleasure in setting the children in different attitudes, holding them naked, and sometimes suspended by strings, when Albani would draw them in a thousand different ways. It was from them, too, that the famous sculptors Flamad and Argaldi modelled their little Cupids.

Albani was of a happy temper and disposition; his paintings, says Malvasia, breathing nothing but content and joy. Happy in a force of mind that conquered every uneasiness, his poetical pencil carried him
N° 9.

through the most agreeable gardens to Paphos and Citheria: those delightful scenes brought him over the lofty Parnassus to the delicious abodes of Apollo and the Muses; whence what Du Fresnoy says of the famous Giulio Romano may be justly applied to Albani:

Taught from a child in the bright Muses' grots,
He open'd all the treasures of Parnassus,
And in the lovely poetry of painting
The myst'ries of Apollo has reveal'd.

He died the 4th of October 1660, to the great grief of all his friends and the whole city of Bologna. Malvasia has preserved some verses of Francisco de Lemene, intended for his monument; the sense whereof is, "That the mortal remains of the illustrious Albani, he who gave life to shade, lie interred in this tomb: the earth never produced so wonderful an artist, or a hand equal to his immortal one; which gave colours to the foul, and a foul to colours. Prometheus animated clay, and gave life by means of the sun; but Albani animated merely by the assistance of shade." He was very famous in his lifetime, and had been visited by the greatest painters. Several princes honoured him with letters; and amongst the rest King Charles I. who invited him to England by a letter signed with his own hand.

ALBANIA, a province of Turkey in Europe, on the gulph of Venice, bounded by Livadia on the south by Thessaly and Macedonia on the east, and on the north by Bosnia and Dalmatia. The people are strong, large, courageous, and good horsemen; but are said to be of a thievish disposition: the grand seignior procures excellent soldiers from hence, particularly cavalry, known by the name of *Arnauts*. There are several large towns in this province; and the inhabitants are almost all Christians of the Greek church, and descended from the ancient Scythians. Formerly it was part of the kingdom of Macedonia. Their chief manufacture is carpets. The principal places are Durazzo, Velona, Antivari, Scutari, Croya, Alesso, Dibra, Dolcigno, and Albanapoli. Long. from 28° to 31° E. Lat. from 39° to 43° N.

ALBANIA, a country of Asia, bounded on the west by Iberia; on the east by the Caspian sea; on the north by mount Caucasus; on the south by Armenia, and the river Cyrus, now Kur; which, springing from the Moschian mountains that separate Colchis from Armenia, and watering the country of Moka, receives the Aragus and Araxes, and falls into the Caspian sea within a small distance from the southern borders of this country.—The whole country formerly called *Albania*, now goes under the names of *Shirwan* and *East-Georgia*, and is extremely fruitful and pleasant. The ancient historians take notice of the Albanian men being tall, strong-bodied, and, generally speaking, of a very graceful appearance; far excelling all other nations in comeliness as well as stature. Modern travellers take no notice of the appearance of the men; but extol the beauty of the women, which seems to be unnoticed by the ancients. The Albanians were anciently an independent and pretty powerful people; but we find no mention made of their kings till the reign of Alexander the Great, to whom the king of Albania is said to have presented a dog of an extraordinary fierceness and size.—It does not appear that the Alba-
nians

Albania.

Albano,
St Albans.

nians were ever conquered by the Romans, even when their power was at its greatest height; though, when they ventured to engage in war with that powerful empire, they were always defeated, as might naturally be expected.

ALBANO, a town of Italy, on a lake of the same name, in the Campagnio of Rome. It was called by the ancients *Albanum Pompeii*, and built out of the ruins of the ancient Alba Longo, which was destroyed by Tullus Hostilius. It stands within twelve miles south-east of Rome, and for the pleasantness of its situation is the summer retirement of a great many Roman princes. It is likewise the see of a bishop, who is one of the six senior cardinals. The town is famous for its excellent wine, and the ruins of a mausoleum, which, according to the tradition of the inhabitants, was made for Alcanius. The prospect from the garden of the Capuchins is extremely pleasant, taking in the Campania of Rome, and terminating in a full view of the Tuscan sea. Close by the town lies the Alban lake, of an oval figure, and about seven miles in circumference, which, by reason of the high mountains round it, looks like the area of a great amphitheatre. It abounds with excellent fish, and over against the hermitage it is said to be unfathomable. The mountain of Albano is called *Monte Cavo*, on the top of which was a celebrated temple dedicated to Jupiter and Juno. Near the Capuchins there is another convent of Franciscans; and not far from thence the palace of Cardinal Barberini, remarkable for very pleasant gardens, with the ruins of ancient baths, and several old fragments of Mosaic work. E. Long. 13. 10. N. Lat. 41. 43.

There is likewise another town of the same name in the Basilicate of the kingdom of Naples, remarkable for the fertility of the surrounding territory, and for the nobility of the inhabitants.

ALBANS (St), a market-town of Hertfordshire, is a very great thoroughfare, accommodated with good inns, on the north-west road from London, at the distance of 21 miles. This town sends two members to parliament, gives the title of *duke* to the noble family of Beauclerc, and has one of the best markets for wheat in England. St Albans is seated near the ruins of an ancient Roman city, by Tacitus called *Verulam*; and by the Saxons *Watlingcestre*, because it is seated on the road called *Watlingstreet*. Nothing now remains of Verulam but the ruins of old walls; in the fields adjacent to which they continue to find Roman coins, as they formerly found tessellated pavements. In memory of St Alban, Offa, king of the Mercians, anno 795, erected an abbey, calling it *St Albans*; and near it the town of the same name was afterwards built. The church of the abbey is remaining to this day: time and the weather have made it look like stone on the outside; but if you break a bit off, the redness of the brick immediately appears. When the monasteries were dissolved, the townsmen paid L. 400 to prevent its being levelled with the ground, and have since converted it into a parish-church, which, for its largeness, beauty, and antiquity, claims a particular regard. It had a very noble font of solid brass, in which the children of the kings of Scotland were used to be baptized; and was brought from Edinburgh, by Sir Philip Lea, when that city was in flames; but in the times of the late civil wars, it was taken away. Not

Vol. I. Part I.

many years since, a tomb was discovered in this church, said to be that of Humphry Duke of Gloucester: when the leaden coffin was opened, the body was pretty entire, being preserved in a sort of pickle. There was a stately cross in the middle of the town, as there were in many other places where queen Eleanor's body rested when it was brought out of the north for interment at Westminster; but it has been demolished, as some say, by the inhabitants. The market-days are Wednesdays and Saturdays. W. Long. 0. 12. N. Lat. 51. 44.

ALBANUS MONS (anc. geog.), now called *Monte Albano*, 16 miles from Rome, near where Alba Longa stood.

ALBANUS MONS (anc. geog.), to the north of Istria, called *Albius* by Strabo; the extremity of the Alps, which, together with the mountains to the east, joining it, called *Montes Bebii*, separates the farther Liburnia and Dalmatia from Pannonia.

ALBANY, a fortress belonging to the British, seated on the S. W. of Hudson's bay. W. Long. 84. 20. N. Lat. 53. 20.

ALBANY, a town of North America, the capital of one of the ten counties of the province of New-York, which goes by the same name, is a well-built place, considering the country. Here the sachems, or the kings of the Five Nations of Iroquois, met the governors of the British plantations, when they entered into any treaty with them. W. Long. 44. 29. N. Lat. 42. 30.

ALBARAZIN, a strong town, and one of the most ancient of the kingdom of Arragon in Spain. It is seated upon an eminence, near the river Guadalquivir, a little below its source, and on the frontiers of Valencia and New Castile. It is the seat of a bishop, and produces the best wool in all Arragon. It is about 100 miles east of Madrid. E. Long. 2. 10. N. Lat. 40. 32.

ALBARII, in antiquity, properly denoted those who gave the whitening to earthen vessels, &c. In which sense they stood contradistinguished from *Dealbatores*, who whitened walls.

ALBARIUM OPUS, in the ancient building, the incrustation or covering of the roofs of houses with white plaster, made of mere lime. This is otherwise called *opus album*. It differs from *Tectorium*, which is a common name given to all roofing or ceiling, including even that formed of lime and sand, or lime and marble; whereas *Albarium* was restrained to that made of lime alone.

ALBATI EQVI, an appellation given to such horses, in the games of the ancient circus, as wore white furniture.

ALBATROSS, in ornithology, a species of the diomedea. See DIOMEDEA:

ALBAZIN, a town of Greater Tartary, with a strong castle. It is situated upon the river Amur, or Yamour, and belongs to the Muscovites. E. Long. 103. 30. N. Lat. 54. 0.

ALBE, a small piece of money, current in Germany, worth only a French sol and seven deniers.

ALBEMARLE, or AUMARLE, a town of France, in Upper Normandy, and in the territory of Caux, from whence the noble family of Keppel takes the title of *Earl*. The serges of this town are in high esteem.

Albanus
||
Albemarle.

Albemarle
||
Albertus.

It is seated on the declivity of a hill, on the confines of Picardy, 35 miles N. E. of Rouen, and 70 N. W. of Paris. E. Long. 2. 21. N. Lat. 49. 50.

ALBEMARLE, the most northern part of the province of North Carolina in America.

ALBENGUA, a town of Italy, in the territory of Genoa. It is the see of a bishop; and is a very ancient handsome town, but not well peopled on account of the insalubrity of the air. However, it is seated in a very beautiful plain, which is well cultivated; and the outside of the town is surrounded with olive-trees. It is a seaport, about 38 miles S. W. of Genoa. E. Long. 8. 13. N. Lat. 44. 4.

ALBERNUO, a kind of camblet, brought from the Levant by the way of Marseilles.

ALBERONI (Julius), the son of a poor gardener in the suburbs of Placentia, born in 1664; who, by his great abilities and good fortune, rose from this low original, to the employment of first minister of state at the court of Spain, and to the dignity of cardinal. He roused that kingdom out of the lethargy it had sunk into for a century past; awakened the attention, and raised the astonishment, of all Europe, by his projects; one of which was to set the Pretender on the throne of Great Britain. He was at length deprived of his employment, and banished to Rome. He died in 1752, at the great age of 89. His *Testament Politique*, collected from his memoirs and letters, was published at Laufanne in 1753.

ALBERT, Margrave of Brandenburg, and the last grand master of the Teutonic Order, laid aside the habit of his order, embraced Lutheranism, and concluded a peace at Cracow in 1525, by which he was acknowledged Duke of the east part of Prussia (formerly called for that reason *Ducal Prussia*), but to be held as a fief of Poland, and to descend to his male heirs. See PRUSSIA.

ALBERTI (Leone Battista), was descended from a noble family in Florence; and was perfectly acquainted with painting, sculpture, and architecture. He wrote of all three in Latin; but his studies did not permit him to leave any thing considerable behind him in painting. He was employed by pope Nicholas V. in his buildings, which he executed in a beautiful manner; and his work on architecture, which consists of ten books, is greatly esteemed. He also wrote some treatises of morality, and a piece on arithmetic. He died in 1485.

ALBERTISTS, a sect of scholastics, so named from their leader Albertus Magnus.

ALBERTUS (Magnus), a Dominican friar, and afterwards bishop of Ratibon, was one of the most learned men and most famous doctors of the 13th century. He is said to have acted as a man-midwife; and some have been highly offended that one of his profession should follow such an employment. A book intitled *De Natura Rerum*, of which he was reputed the author, gave rise to this report. In this treatise there are several instructions for midwives, and so much skill shown in their art, that one would think the author could not have arrived at it without having himself practised: but the advocates for Albert say he was not the writer thereof, nor of that other piece *De Secretis Mulierum*; in which there are many phrases and expressions unavoidable on such a subject, which

gave great offence, and raised a clamour against the supposed author. It must be acknowledged, however, that there are, in his Comment upon the Master of Sentences, some questions concerning the practice of conjugal duty, in which he has used some words rather too gross for chaste and delicate ears: but they allege what he himself used to say in his own vindication, that he came to the knowledge of so many monstrous things at confession, that it was impossible to avoid touching upon such questions. Albert was certainly a man of a most curious and inquisitive turn of mind, which gave rise to other accusations brought against him. They say, that he laboured to find out the philosopher's stone; that he was a magician; and that he made a machine in the shape of a man, which was an oracle to him, and explained all the difficulties he proposed. He had great knowledge in the mathematics, and by his skill in that science might probably have formed a head with springs capable of articulate sounds; like to the machines of Boëtius, of which Cassiodorus has said, "Metals lowe; the birds of Diomedes trumpet in brass; the brazen serpent hisses; counterfeited swallows chatter, and such as have no proper note, from brass send forth harmonious music." John Matthæus de Luna, in his treatise *De Rerum Inventoribus*, has attributed the invention of fire-arms to Albert; but in this he is confuted by Naude, in his *Apolo- gie des Grands Hommes*. We are told, that Albert was naturally very dull, and so incapable of instruction, as to be upon the point of quitting the cloister, from despair of learning what his habit required: but that the Holy Virgin appeared to him, and asked him in which he chose to excel, philosophy or divinity? that having chosen the former, she assured him he should become incomparable therein; but that, as a punishment for not preferring divinity, he should sink, before he died, into his former stupidity. It is added, that after this apparition he had an infinite deal of wit; and that he advanced in all the sciences with so quick a progress, as utterly astonished his masters: but that, three years before his death, he stopped short when reading a divinity-lecture at Cologne; and having in vain endeavoured to recal his ideas, he found that the Virgin's prediction was accomplished. "It would be very unnecessary (says Bayle, after relating these particulars) to observe that they are fables. Those who would believe me need not be told this, since they would judge in the same manner of their own accord; and as for such as think otherwise, they would not alter their opinion by reading here that I am of a different way of thinking." Albert died at Cologne, November 15. 1280. His works were printed at Lyons, in 1651, in 21 volumes in folio.

ALBERTUS, a gold coin, worth about 14 French livres: it was coined during the administration of Albertus archduke of Austria.

ALBESIA, in antiquity, a kind of shields otherwise called *Decumana*. See DECUMANA.

ALBI, a city of France, the capital of the Albigeois, in Languedoc, and the see of an archbishop. The cathedral is dedicated to St Cecilia, and has one of the finest choirs in the kingdom. Here is a very valuable silver shrine, of exquisite workmanship, of the Mosaic kind: it contains the reliques of St Clair, the first bishop of this city. The chapel of this

†aint

Albertus
||
Albi.

Albi. **Albigenses.** faint is magnificent, and adorned with paintings. The Lice is a fine large walk without the city: what distinguishes this from all others, is a terras above a deep mall, which serves instead of a fosse; it is bordered with two rows of very fine trees, which are kept in excellent order. There are four gates, through which you may view all the beauties of a delightful plain. At one end of this is the convent of the Dominicans. The archbishop's palace is very beautiful. The river washes its walls, and serves both for an ornament and defence. This city is seated on the river Tarn, 35 miles north-by-west of Touloufe, and 250 south of Paris. E. Long. 0. 52. N. Lat. 43. 56.

The Albigeois is a small territory about 27 miles in length, and 20 in breadth, abounding in corn, woad, grapes, saffron, plums; and sheep; and the inhabitants drive a great trade in dried prunes, grapes, a coarse sort of cloth, and wines of Gaillac. These wines are the only sorts hereabouts that are fit for exportation: they are carried down to Bourdeaux, and generally sold to the British. They have likewise several coal-mines.

ALBIGENSES, in church-history, a sect or party of reformers, about Touloufe and the Albigeois in Languedoc, who sprung up in the 12th century, and distinguished themselves by their opposition to the discipline and ceremonies of the Romish church.

This sect had their name, it is supposed, either by reason there were great numbers of them in the diocese of Albi, or because they were condemned by a council held in that city. In effect, it does not appear that they were known by this name before the holding of that council. The *Albigenses* were also called *Albians*, *Albigesei*, *Albii*, and *Albanenses*, though some distinguish these last from them. Other names given to them are, *Henricians*, *Abelardists*, *Bulgarians*, &c. some on account of the qualities they assumed; others on that of the country from whence it is pretended they were derived; and others on account of persons of note who adopted their cause, as Peter de Brius, Arnold de Breffe, Abelard, Henry, &c. Berengarius, if not Wickliff himself, is by some ranked in the number. The *Albigenses* are frequently confounded with the *Waldenses*; from whom, however, they differ in many respects, both as being prior to them in point of time, as having their origin in a different country, and as being charged with divers heresies, particularly Manicheism, from which the *Waldenses* are exempt. But several Protestant writers have vindicated them from that imputation. Dr Allix shows, that a great number of *Manichees* did spread over the western countries from Bulgaria; and settled in Italy, Languedoc, and other places, where there were also *Albigenses*; by which means, being both under the imputation of *heresy*, they came, either by ignorance or malice, to be confounded, and called by the same common name, though in reality entirely different.

Other errors imputed to them by their opponents, the monks of those days, were, That they admitted two Christs; one evil, who appeared on earth; the other good, who has not yet appeared: That they denied the resurrection of the body; and maintained human souls to be dæmons imprisoned in our bodies, by way of punishment for their sins: That they condemned all the sacraments of the church; rejected baptism as

useless; held the eucharist in abhorrence; excluded the use of confessions and penance; maintained marriage unlawful; laughed at purgatory, prayers for the dead, images, crucifixes, &c.—There were likewise said to be two classes of them; the Perfect, and the Believers. The perfect boasted of their living in continence, of eating neither flesh, eggs, nor cheese. The believers lived like other men, and were even loose in their morals; but they were persuaded they should be saved by the faith of the perfect, and that none were damned who received imposition of hands from them. But from these charges also they are generally acquitted by Protestants; who consider them as the pious inventions of the Romish church, whose members deem it meritorious by any means to blacken heretics.

However this be, the *Albigenses* grew so formidable, that the Catholics agreed upon a holy league or crusade against them. They were at first supported by Raimond, count of Touloufe. Pope Innocent III. desirous to put a stop to their progress, sent a legate into their country; which failing, he stirred up Philip Augustus, king of France, and the other princes and great men of the kingdom, to make war upon them. Upon this the count of Touloufe, who had sided with them, made his submission to the pope, and went over to the Catholics: but soon after, finding himself plundered by the crusaders, he declared war against them, and was joined by the king of Arragon. His army was defeated at the siege of Muret, where he himself was killed, and the defeat followed by the surrender of the city of Touloufe, and the conquest of the greatest part of Languedoc and Provence. His son Raimond succeeded him; who agreed with the king and the pope to set up the inquisition in his estates, and to extirpate the *Albigenses*. In an assembly held at Milan, the archbishop of Touloufe drew up articles; agreeable to which the count made a most ample declaration against them, which he published at Touloufe in 1253. From this time the *Albigenses* dwindled by little and little, till the times of the reformation; when such of them as were left fell in with the Vaudois, and became conformable to the doctrine of Zuinglius and the disciples of Geneva.

ALBIGENSES is also a name sometimes given to the followers of Peter Vaud, or Waldo; and hence synonymous with what we more properly call *Waldenses*, or Poor Men of Lyons. In this sense the word is applied by Camerarius, Thuanus, and several other writers. The reason seems to be, that the two parties agreed in their opposition to the papal innovations and encroachments, though in divers other respects said to be different enough. The bishop of Meaux labours hard to support a distinction between the two sects, alleging that the *Albigenses* were heretics and Manichees; whereas the *Waldenses* were only schismatics, not heretics; being found as to articles of faith, and only separating from the church of Rome on account of forms and discipline. Dr Allix endeavours to set aside the distinction; and shows, that both of them hold the same opinions, and were equally condemned and held for heretics: and this not for points of faith, but for declaiming against the papal tyranny and idolatry, and holding the pope to be the Antichrist; which last, according to M. de Meaux, constitutes nothing less than

Albintemelum
||
Albinos.

Manicheism. In this sense the Lollards and Wickliffites in England were not only Albigenes but Manichees.

ALBINTEMELIUM, ALBINTIMILIUM, (Tacitus;) or at full length, ALBIUM INTEMELIUM, (Pliny, Strabo); now *Vintimiglia*, situated in the south-west of the territory of Genoa, near the borders of the county of Nice, with a port on the Mediterranean, at the mouth of the rivulet Rotta, almost about half-way between Monaco and S. Remo. E. Long. 7. 40. Lat. 43. 17.

ALBIOECE, or ALEBECE, (Pliny, Strabo); otherwise called *Reii Apollinares*, from their superstitious worship of Apollo; also *Civitas Reiensium*; now *Riez*, in Provence, about 18 leagues to the north-east of Toulon, on the north side of the rivulet Verdon; was originally a Roman colony, (Inscription.) It is sometimes written *Regium*. The people were called *Albici*, (Cæsar.) E. Long. 1. 0. Lat. 43. 20.

ALBINI, in antiquity, the workmen employed in what was called *Opus Albarium*. They make a different profession from the *dealbatores* or *whiteners*.

ALBINOS, the name by which the Portuguese call the white Moors, who are looked upon by the negroes as monsters. They at a distance might be taken for Europeans; but, when you come near them, their white colour appears like that of persons affected with a leprosy.

In SAUSSURE'S *Voyages dans les Alpes*, is the following account of two boys, at Chamouni, who have been called *Albinos*. "The elder, who was at the end of the year 1785 about twenty, or one and-twenty years of age, had a dull look; with lips somewhat thick, but nothing else in his features to distinguish him from other people. The other, who is two years younger, is rather a more agreeable figure: he is gay and sprightly, and seems not to want wit. But their eyes are not blue; the iris is of a very distinct rose-colour: the pupil too, when viewed in the light, seems decidedly red; which seems to demonstrate, that the interior membranes are deprived of the uvea, and of that black mucous matter that should line them. Their hair, their eye-brows, and eye-lashes, the down upon their skin, were all, in their infancy, of the most perfect milk-white colour, and very fine; but their hair is now of a reddish cast, and has grown pretty strong. Their sight too is somewhat strengthened; though they exaggerate to strangers their aversion for the light, and half-shut the eye-lids, to give themselves a more extraordinary appearance. But those who, like me, have seen them in their infancy, before they were tutored to this deceit, and when too few people came to Chamouni to make this affectation profitable to them, can attest that then they were not very much offended with the light of day. At that time, they were so little desirous of exciting the curiosity of strangers, that they hid themselves to avoid such; and it was necessary to do a sort of violence to them before they could be prevailed on to allow themselves to be inspected. It is also well known at Chamouni, that when they were of a proper age they were unable to tend the cattle like the other children at the same age; and that one of their uncles maintained them out of charity, at a time of life when others were capable of gaining a subsistence by their labour.

Albinos.

"I am therefore of opinion, that we may consider these two lads as true albinos: for if they have not the thick lips and flat noses of the white negroes, it is because they are albinos of Europe, not of Africa. This infirmity affects the eyes, the complexion, and the colour of the hair; it even diminishes the strength, but does not alter the conformation of the features. Besides, there are certainly in this malady various degrees: some may have less strength, and be less able to endure the light: but these circumstances in those of Chamouni are marked with characters sufficiently strong to intitle them to the unhappy advantage of being classed with that variety of the human species denominated albinos.

"When nature presents the same appearance often, and with circumstances varied, we may at last discover some general law, or some relation which that appearance has with known causes: but when a fact is so singular and so rare, as that of those albinos, it gives but little scope to conjectures; and it is very difficult to verify those by which we attempt to explain it.

"I at first imagined that this disease might be referred to a particular sort of organic debility; that a relaxation of the lymphatic vessels within the eye might suffer the globules of the blood to enter too abundantly into the iris, the uvea, and even into the retina, which might occasion the redness of the iris and of the pupil. The same debility seemed also to account for the intolerance of the light, and for the whiteness of the hair.

"But a learned physiologist, M. Blumenbach, professor in the university at Gottingen, who has made many profound observations on the organs of sight, and has considered with great attention the albinos of Chamouni, attributes their infirmity to a different cause.

"The study of comparative anatomy has furnished him with frequent opportunities of observing this phenomenon; he has found it in brutes, in white dogs, and in owls; he says, it is generally to be seen in the warm-blooded animals; but that he has never met with it in those with cold blood.

"From his observations, he is of opinion, that the redness of the iris, and of the other internal parts of the eye, as well as the extreme sensibility that accompanies this redness, is owing to the total privation of that brown or blackish mucus, that, about the fifth week after conception, covers all the interior parts of the eye in its sound state. He observes, that Simon Pontius, in his treatise *de Coloribus Oculorum*, long ago remarked, that in blue eyes the interior membranes were less abundantly provided with this black mucus, and were therefore more sensible to the action of light. This sensibility of blue eyes agrees very well, says M. Blumenbach, with northern people, during their long twilight; while, on the contrary, the deep black in the eyes of negroes enables them to support the splendor of the sun's beam in the torrid zone.

"As to the connection between this red colour of the eyes and the whiteness of the skin and hair, the same learned physiologist says, that it is owing to a similarity of structure, *consensus et similitudine fabricæ*. He asserts, that this black mucus is formed only in the delicate cellular substance, which has numerous blood-vessels contiguous to it, but contains no fat; like the inside of the eye, the skin of negroes, the spotted palate of several domestic animals, &c. And, lastly, he says,

Albinos. fays, that the colour of the hair generally corresponds with that of the iris. *Gazette litt. de Gotingue*, Oct. 1784.

“At the very time that M. Blumenbach was reading this memoir to the Royal Society of Gottingen, M. Buzzi, surgeon to the hospital at Milan, an eleve of the celebrated anatomist *Moscatti*, published, in the *Opuscoli Scelti de Milan*, 1784, t. vii. p. 111. a very interesting memoir, in which he demonstrates by dissection what Blumenbach had only supposed.

“A peasant of about 30 years of age died at the hospital of Milan of a pulmonary disorder. His body, being exposed to view, was exceedingly remarkable by the uncommon whiteness of the skin, of the hair, of the beard, and of all the other covered parts of the body. M. Buzzi, who had long desired an opportunity of dissecting such a subject, immediately seized upon this. He found the iris of the eyes perfectly white, and the pupil of a rose-colour. The eyes were dissected with the greatest possible care, and were found entirely destitute of that black membrane which anatomists call the *uvea*; it was not to be seen either behind the iris, or under the retina: within the eye there was only found the choroid coat extremely thin and tinged, of a pale red colour, by vessels filled with discoloured blood. What was more extraordinary, the skin, when detached from different parts of the body, seemed also entirely divested of the *rete mucosum*: maceration did not discover the least vestige of this, not even in the wrinkles of the abdomen, where it is most abundant and most visible.

“M. Buzzi likewise accounts for the whiteness of the skin and of the hair, from the absence of the *rete mucosum*, which, according to him, gives the colour to the cuticle, and to the hairs that are scattered over it. Among other proofs of this opinion, he alleges a well-known fact, that if the skin of the blackest horse be accidentally destroyed in any part of the body, the hairs that afterwards grow on that part are always white, because the *rete mucosum* which tinges those hairs is never regenerated with the skin.

“The proximate cause of the whiteness of albinos, and the colour of their eyes, seems therefore pretty evidently to depend on the absence of the *rete mucosum*: But what is the remote cause?

“In the first place, it seems probable that men affected with this infirmity form no distinct species, for they are produced from parents that have dark skins and black eyes. What is it then that destroys the *rete mucosum* in such persons? M. Buzzi relates a singular fact, which seems to throw some light on this subject.

“A woman of Milan, named Calcagni, had seven sons. The two eldest had brown hair and black eyes; the three next had white skins, white hair, and red eyes: the two last resembled the two eldest. It was said that this woman, during the three pregnancies that produced the albinos, had a continual and immoderate appetite for milk, which she took in great quantities: but that when she was with child of the other four children, she had no such desire. It is not however ascertained, that this preternatural appetite was not itself the effect of a certain heat, or internal disease, which destroyed the *rete mucosum* in the children before they were born.

“The albinos of Chamouni are also the offspring of

parents with dark skins and black eyes. They have three sisters by the same father and mother, who are also brunettes. One of them that I saw had the eyes of a dark brown, and the hair almost black. They are said, however, to be all afflicted with a weakness of sight. When the lads are married, it will be curious to observe how the eyes of their children will be formed. The experiment would be particularly decisive if they were married to women like themselves. But this faulty conformation seems to be more rare among women than among men; for the four of Milan, the two of Chamouni, the one described by Mauperitus, the one by Helvetius, and almost all the instances of these singular productions, have been of our sex. It is known, however, that there are races of men and women affected with this disease, and that these races perpetuate themselves, in Guinea, in Java, at Panama, &c.

“Upon the whole, this degeneration does not seem to be owing to the air of the mountains; for though I have traversed the greatest part of the Alps, and the other mountains of Europe, these are the only individuals of the kind that ever I met with.”

ALBINOVANUS, a Latin poet, whom Ovid furnished the *Divine*. There is now nothing of his extant, except an Elegy on Drusus, and another on the Death of Mæcenas.

ALBINUS (Bernhård Siegfred), a celebrated physician and anatomist, was born, of an illustrious family, at Francfort on the Oder in 1697. His father was then professor of the practice of medicine in the university of Francfort; but in the year 1702 he repaired to Leyden, being nominated professor of anatomy and surgery in that university. Here his son had an opportunity of studying under the most eminent masters in Europe, who, from the singular abilities which he then displayed, had no difficulty in prognosticating his future eminence. But while he was distinguished in every branch of literature, his attention was particularly turned to anatomy and surgery. His peculiar attachment to these branches of knowledge gained him the intimate friendship of Ruysch and Rau, who at that time flourished in Leyden; and the latter, so justly celebrated as a lithotomist, is said to have seldom performed a capital operation without inviting him to be present. Having finished his studies at Leyden, he went to Paris, where he attended the lectures of DuVerney, Vaillant, and other celebrated professors. But he had scarce spent a year there, when he was invited by the curators of the university of Leyden, to be a lecturer in anatomy and surgery at that place. Though contrary to his own inclination, he complied with their request, and upon that occasion was created Dr of physic without any examination. Soon after, upon the death of his father, he was appointed to succeed him as professor of anatomy; and upon being admitted into that office on the 9th of November 1721, he delivered an oration, *De vera via ad fabricam humani corporis cognitionem ducente*; which was heard with universal approbation. In the capacity of a professor, he not only bestowed the greatest attention upon the instruction of the youth entrusted to his care, but in the improvement of the medical art. With this view, he published many important discoveries of his own; and by elegant editions, turned the attention of physicians to works of merit, which might otherwise have been neglected.

neglected. By these means his fame was soon extended over Europe; and the societies of London, Peterburgh, and Harlem, cheerfully received him as an associate. In 1745, he was appointed professor of the practice of medicine at Leyden, and was succeeded in the anatomical chair by his brother Frid. Bern. Albinus. He was twice rector of the university, and as often he refused that high honour when it was voluntarily offered him. At length, worn out by long service and intense study, he died on the 9th of September 1770, in the 74th year of his age.

ALBION, the ancient name of BRITAIN.

New Albion, a name given by Sir Francis Drake to California.

ALBIREO, (in Astronomy) a star of the third or fourth magnitude, in the constellation CYGNUS.

ALBIS, (in anc. geog.) now the Elbe, which divided ancient Germany in the middle, and was the boundary of the ancient geography of Germany, so far as that country was known to the Romans: all beyond they owned to be uncertain, no Roman except Drusus and Tiberius having penetrated so far as the Elbe. In the year of the building of the city 744, or about six years before Christ, Domitius Ahenobarbus, crossing the river with a few, merited the ornaments of a triumph; so glorious was it reckoned at Rome to have attempted the passage. In the following age, however, the river that before occupied the middle of ancient Germany, became its boundary to the north, from the irruptions of the Sarmatae, who possessed themselves of the Transalbin Germany. The Elbe rises in the borders of Silesia, out of the Rifenberg, runs through Bohemia, Misnia, Upper Saxony, Anhalt, Magdeburg, Brandenburg, Danneberg, Lauenburg, Holstein, and after being swelled by many other rivers, and passing by Hamburg and Gluckstadt, falls into the German, or North sea, to both which places the river is navigable by large vessels.

ALBISOLA, a small town belonging to the republic of Genoa: here is a porcelain manufacture, and several country-houses of the Genoese nobility. It was bombarded in 1745 by the English. E. Long. 8. 20. N. Lat. 44. 15.

ALBOGALERUS, in Roman antiquity, a white cap worn by the *flamen dialis*, on the top of which was an ornament of olive branches.

ALBORAK, amongst the Mahometan writers, the beast on which Mahomet rode in his journeys to heaven. The Arab commentators give many fables concerning this extraordinary vehicle. It is represented as of an intermediate shape and size between an ass and a mule. A place, it seems, was secured for it in paradise at the intercession of Mahomet; which, however, was in some measure extorted from the prophet, by Alborak's refusing to let him mount him when the angel Gabriel was come to conduct him to heaven.

ALBORO, in zoology, a name by which the erythrinus, a small red fish, caught in the Mediterranean, is commonly known in the markets of Rome and Venice.

ALBOURG, a town of Denmark, in North Jutland, capital of the diocese of the same name, and a bishop's see. It has this name, which signifies *eel-town*, on account of the great number of eels taken here. It is seated on a canal, 10 miles from the sea, 30 north of Wiburgh, and 50 north of Arhuys. It has an ex-

change for merchants, and a safe and deep harbour. They have a considerable trade in herrings and corn; and a manufactory of guns, pistols, saddles, and gloves. E. Long. 29. 16. N. Lat. 56. 35.

ALBRICIUS, born at London, was a great philosopher, a learned and able physician, and well versed in all the branches of polite literature. He lived in the 11th century, and wrote several works in Latin, particularly, 1. Of the origin of the gods. 2. The virtues of the ancients. 3. The nature of poison, &c.

ALBUCA, BASTARD STAR-OF-BETHLEHEM: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 10th order, *Coronariae*. The characters are: The *calyx* is wanting: The *corolla* consists of six oval oblong petals, which are persistent: The *stamina* consist of six three-sided filaments the length of the corolla: Of these, three are fertile, with versatile antheræ; three are barren, without antheræ: The *pisillum* has an oblong three-sided germen; the *stylus* is three-sided: The *pericarpium* is an oblong obtuse triangular capsule, having three cells and three valves: The *seeds* are numerous, flat, and incumbent. Of this genus Linnæus reckons only two

Species. 1. The major, or star-flower, with spear-shaped leaves. This is a native of Canada, and some other parts of North America: the root is bulbous; from whence shoot up eight or ten long, narrow, spear-shaped leaves. In the centre of these arises a flower-stem, a foot or more in height, garnished with a loose spike of greenish yellow flowers. After the flowers are past, the germen swells to a three-cornered capsule, having three cells filled with flat seeds. 2. The minor, or African star-flower, is a native of the Cape of Good Hope. This hath also a pretty large bulbous root, from which arise four or five narrow awl-shaped leaves, of a deep green colour; the flower-stem, which comes from the center of the root, is naked, and rarely rises more than eight or nine inches high, having five or six greenish-yellow flowers, growing almost in the form of an umbel at top: these are rarely succeeded by seeds in Britain.

Culture. The Canada albica is hardy; so the roots may be planted about four inches deep in a border of light earth, where they will thrive and produce their flowers late in the summer: but as the seeds do not often ripen in Britain, and the bulbs put out few offsets, the plants are not common in this country. The African sort generally flowers twice a-year; first in March or April, and again in July or August; and if its roots are kept in pots filled with light earth, sheltered under a hot-bed frame, they will flower even in winter; but the best method is to have a border in the front of a green-house, or stove, where the roots of most of the bulbous flowers may be planted in the full ground, and screened in winter from frost: in such situations they thrive much better, and flower stronger, than when kept in pots.

ALBUGINEA TUNICA, in anatomy, the third or innermost coat or covering of the testes; it is likewise the name given to one of the coats of the eye.

ALBUGINEUS, in anatomy, a term sometimes applied to the aqueous humour of the eye.

ALBUGO, or LEUCOMA, in medicine, a distemper occasioned

Albricius
||
Albugo.

Album
||
Albumen.

occasioned by a white opaque spot growing on the *cornea* of the eye, and obstructing vision. See *MEDICINE* (Index).

ALBUM, in antiquity, a kind of white table, or register, wherein the names of certain magistrates, public transactions, &c. were entered. Of these there were various sorts; as the *album decurionum*, *album senatorum*, *album judicum*, *album pratoris*, &c.

ALBUM Decurionum, was the register wherein the names of the *decuriones* were entered. This is otherwise called *matriculatio decurionum*.

ALBUM Senatorum, the list of senators names, which was first introduced by Augustus, and renewed yearly.

ALBUM Judicum, that wherein the names of the persons of those *d. curiæ* who judged at certain times, were entered.

ALBUM Pratoris, that wherein the *formulae* of all actions, and the names of such judges as the prætor had chosen to decide causes, were written.

The high-priest entered the chief transactions of each year into an *album*, or table, which was hung up in his house for the public use.

ALBUM is also used, in later times, to denote a kind of table, or pocket-book, wherein the men of letters with whom a person has conversed, inscribe their names with some sentence or motto.—The famous Algernon Sydney being in Denmark, was by the university of Copenhagen presented with their *album*, whereupon he wrote these words:

Manus hæc inimica tyrannis
Ense petit placidam sub libertate quietem.

ALBUM Græcum, among physicians, the white dung of dogs, formerly prescribed for inflammations of the throat, &c. but now justly despised.

ALBUMAZAR, a learned Arabian astronomer in the tenth century, who wrote a treatise, *Of the Revolution of the Years*.

ALBUMEN, the white of an egg. For its nature, origin, and office, see *EGG*.

The white of an egg, according to Boerhaave, makes an extraordinary menstruum. Being boiled hard in the shell, and afterwards suspended in the air by a thread, it resolves and drops down into an insipid, scentless, liquor, which appears to be that anomalous unaccountable menstruum so much used by Paracelsus; and will, though it contain nothing sharp, oleaginous, or saponaceous, make a thorough solution of myrrh; which is more than either water, oil, spirits, or even fire itself, can effect.

A little putrid white of egg taken into the stomach, occasions a nausea, horror, fainting, vomiting, diarrhoea, and gripes; it inflames the bile, excites heat, thirst, fever; and dissolves the humours like the plague. On the contrary, the white of fresh-laid eggs, if taken while warm from the hen, is extremely nourishing to the infirm: it may be taken in luke-warm milk; but if any other heat is applied to it, the nutritious quality will be destroyed. The fresh white of egg prevents burns from rising in blisters, if it is used immediately after the accident: it mitigates inflammations of the eyes, and preserves the face from sun-burning. In pharmacy, it is used as a medium to render balsams and turpentine, &c. miscible with aqueous fluids; but as it disagrees with many stomachs when thus taken, a mucilage of gum arabic may supply its place, it being as

good a medium in similar circumstances, and not apt to offend the tenderest stomach.—Whites of eggs are also useful for clarifying liquors; to which purpose, being mixed and incorporated with the liquors to be clarified, and the whole afterwards boiled, the whites of eggs are by this means brought together and hardened, and thus carry off the gross parts of the liquor along with them.

ALBUQUERQUE, a small city in Spain, in the province of Estremadura, is seated on an eminence, nine miles from the frontiers of Portugal. It is commanded by an almost impregnable fortress, built on a high mountain, and serving to defend the town. It carries on a great trade in wool and woollen manufactures. It was taken by the allies of Charles king of Spain, in 1705. W. Long. 7.0. N. Lat. 38.52.

ALBURN, the English name of a compound colour, being a mixture of white and red, or reddish brown. Skinner derives the word, in this sense, from the Latin *albus*, and the Italian *burno*, from *bruno*, brown.

ALBURNUM, the soft white substance which in trees is found between the liber or inner bark and the wood, and in progress of time acquiring solidity, becomes itself the wood. From its colour and comparative softness, it has been styled by some writers the fat of trees, *adeps arborum*.

The alburnum is found in largest quantities in trees that are vigorous; though in such as languish, or are sickly, there is a great number of beds. In an oak six inches in diameter, this substance is nearly equal in bulk to the wood. In a trunk of one foot diameter, it is as one to three and a half; of two and a half feet diameter, as one to four and a half, &c. but these proportions vary according to the health and constitution of the trees.—The alburnum is frequently gnawed in pieces by insects, which lodge in the substance, and are nourished from it.

ALBURNUS, in zoology, a species of the *cyprinus* of Linnæus. See *CYPRINUS*.

ALCA, or **AUK**, in ornithology, a genus of the order of anseres. The beak of this genus is without teeth, short, convex, compressed, and frequently furrowed transversely; the inferior mandible is gibbous near the base; the feet have generally three toes. The species of the alca are 12; of which the most remarkable are,

1. The impennis, northern penguin, or great auk, with a compressed bill furrowed on each side, and an oval spot on each side of the eyes. According to Mr Martin, this bird breeds on the isle of St Kilda; appearing there the beginning of May, and retiring the middle of June. It lays one egg, which is six inches long, of a white colour; some are irregularly marked with purplish lines crossing each other, others blotched with black, and ferruginous about the thicker end: if the egg is taken away, it will not lay another that season. Mr Macaulay informs us that it does not visit that island annually, but sometimes keeps away for several years together; and adds, that it lays its egg close to the sea-mark, being incapable, by reason of the shortness of its wings, to mount higher. The length of this bird, to the end of its toes, is three feet: but its wings are so small, as to be useless for flight; the length, from the tip of the longest quill-feathers to

Albu-
querque
||
Alca.

Alca.

the first joint, being only four inches and a quarter. This bird is observed by seamen never to wander beyond soundings; and according to its appearance they direct their measures, being then assured that land is not very remote. It sometimes frequents the coasts of Norway, the Ferroe isles, Iceland, Greenland, and Newfoundland; and feeds much on the lump-fish, father-lasher, and other fish of that size. The young birds eat rose-root, and other plants. The old ones are very rarely seen on shore, tho' the young ones are not unfrequently met with. It is a very shy bird. It walks ill; but dives well, and is taken in the manner used for the razor-bill and puffin. The skin between the jaws is blown into a bladder, and used for the darts of the Greenlanders, as is also that of some other birds. The skin of the body is supposed to be used by the Esquimaux Indians for garments.

2. The alle, little auk, or black and white diver, with a smooth conical bill, a white streak on the belly and wings, and black feet. The bulk of this species exceeds not that of a black-bird. It is not very common in Britain, being only met with now and then. It seems to be most plentiful towards the north, being met with in various parts as far as Spitzbergen. It is common in Greenland, in company with the black-billed species; feeds on the same food; and lays two blueish white eggs, larger than those of a pigeon. It flies quick, and dives well; and is always dipping its bill into the water while swimming or at rest on the water. It grows fat in the stormy season, from the waves bringing plenty of crabs and small fish within its reach; but from its size it is less sought after than the others. In Greenland it is called the *Ice-bird*, being the harbinger of ice. This species is sometimes seen of a pure white.

3. The arctica, or puffin, with a compressed bill and four furrows; the orbit of the eyes and temples are white. The legs of this species are very small; and placed so far behind as to disqualify it from standing, except quite erect, resting not only on the foot, but the whole length of the leg. This circumstance* makes the rise of the puffin from the ground very difficult, and it meets with many falls before it gets on wing; but when that is effected, few birds fly longer or stronger. These birds frequent the coasts of several parts of Great Britain and Ireland; but no place in greater numbers than Prieftholm isle, where their flocks may be compared to swarms of bees for multitude. These are birds of passage; they resort there annually about the fifth or tenth of April, quit the place (almost to a bird), and return twice or thrice before they settle to burrow and prepare for ovation and incubation. They begin to burrow the first week in May; but some few save themselves that trouble, and dislodge the rabbits from their holes, taking possession of them till their departure from the isle. Those which form their own burrows, are at that time so intent on the work as to suffer themselves to be taken by the hand. This task falls chiefly to the share of the males; who also assist in incubation. The first young are hatched the beginning of July. The old ones show vast affection towards them; and seem totally insensible of danger in the breeding season. If a parent is taken at that time, and suspended by the wings, it will in a sort of despair treat itself most cruelly, by biting every part it can

* It attends every one of the genus.

N^o 9.

reach; and the moment it is loosed, will never offer to escape, but instantly resort to its unfledged young: this affection ceases at the stated time of migration, which is most punctually about the 11th of August, when they leave such young as cannot fly to the mercy of the peregrine falcon, who watches the mouths of the house for the appearance of the little deserted puffins, which, forced by hunger, are compelled to leave their burrows. They lay only one egg. The eggs differ much in form: some have one end very acute; others have both extremely obtuse; all are white. Their flesh is excessively rank, as they feed on sea-weeds and fish, especially sprats: but when pickled and preserved with spices, are admired by those who love high-eating. Dr Caius tells, that, in his days, the church allowed them in lent, instead of fish: he also acquaints us, that they were taken by means of ferrets, as we take rabbits: at present, they are either dug out, or drawn from their burrows by a hooked stick: they bite extremely hard; and keep such fast hold on whatever they fasten, as not to be easily disengaged. Their noise, when taken, is very disagreeable; being like the efforts of a dumb person to speak. These birds are also common in Ireland; on the island Sherries, three leagues N. N. W. of Holyhead; and in the S. Stack, near Holyhead, they breed in plenty. They inhabit Iceland and Greenland; and breed in the extreme part of the islands. It is also found in the Ferroe isles, where it is called *Lunda*; and in the Farn isles, where it is called *Coulterneb*, from the shape of the bill. It goes also by various other names; such as *Gulden-head*, *Bottle-nose*, and *Helegug*, in Wales; at Scarborough, *Mullet*; and in Cornwall, *Pope*. In America they are said to frequent Carolina in winter; and have been met with in Sandwich Sound by our late voyagers: the natives ornament the fore parts and collar of their seal-skin jackets with the beaks of them; and those of Aoonalashka wear gowns of their skins, along with those of other birds. On the coast of Kamtschatka and the Kurulshchi islands they are common, even on the Penschinski bay, almost as far as Ochotka: the nations of the two first wear the bills about their necks fastened to straps; and, according to the superstition of these people, their shaman or priest must put them on with a proper ceremony, in order to procure good fortune.

4. The torda, or razor-bill, with four furrows on the bill, and a white line on each side running from the bill to the eyes. These birds, in company with the guillemot, appear in our seas the beginning of February; but do not settle on their breeding places till they begin to lay, about the beginning of May. They inhabit the ledges of the highest rocks that impend over the sea, where they form a grotesque appearance; sitting close together, and in rows one above another. They properly lay but one egg a-piece, of an extraordinary size for the bulk of the bird, being three inches long: it is either white, or of a pale sea-green, irregularly spotted with black: if this egg is destroyed, both the auk and the guillemot will lay another; if that is taken, then a third: they make no nest, depositing their egg on the bare rock; and though such multitudes lay contiguous, by a wonderful instinct each distinguishes its own. What is also matter of great amazement, they fix their egg on the smooth rock, with so exact a balance, as to secure it from rolling off; yet should

Alca.

Alca. should it be removed, and then attempted to be replaced by the human hand, it is extremely difficult, if not impossible, to find its former equilibrium. According to Mr Latham, it is by means of a cement that the bird fixed its egg. The eggs are food to the inhabitants of the coasts they frequent; which they get with great hazard; being lowered from above by ropes, trusting to the strength of their companions, whose footing is often so unstable that they are forced down the precipice, and perish together. These birds are found in the north of Europe, also in Iceland, Greenland, and on the coast of Labrador. In Europe they extend along the White Sea into the Arctic Asiatic shores, and from thence to Kamtschatka and the gulph of Ochotka: It is the only one which reaches the inland Baltic; being found there on the Carls-Ozar isles, near Gotland, and the isle of Bondon off Angermania.

5. The pica, or black-billed auk, has the bill of the same form with the torda, but is entirely black. The cheeks, chin, and throat, are white: in all other respects it agrees with the former species. Mr Latham is of opinion that it is no other than the young of that species. Mr Pennant observes, that it is sometimes found on our coasts; but, according to Mr Latham, it is in the winter-season only, when the common sort has quitted them. They are said to be met with on the coast of Candia and other parts of the Mediterranean; "where, no doubt (Mr Latham observes) the complete old bird is likewise found, as I have been informed that they are common in the bay of Gibraltar, where it is curious to see their activity under water when pursuing the fish; for, as the water in the bay is sometimes clear for a great depth from the surface, these birds may be often seen as it were flying after their prey, with all the agility of a bird in the air, turning in every direction after the fish, with such wonderful address and dexterity as seldom to miss their aim."

6. The cirrhata of Dr Pallas, or tufted auk, somewhat bigger than the common puffin, and the colours much the same: the bill is an inch and three-quarters in length, the same in depth at the base, and crossed with three furrows: over each eye arises a tuft of feathers four inches in length, which falls elegantly on each side of the neck, reaching almost to the back; and are white as far as they are attached to the head, but afterwards of a fine buff yellow: the legs are of a bright red; the claws black. The female is principally distinguished by having the bill crossed only with two furrows instead of three. This species inhabits the shores of Kamtschatka, the Kurile islands, and those intervening between Kamtschatka and America. In manners it greatly resembles the puffin; living all day at sea, but at no great distance from the rocks; it comes on shore at night; burrows a yard deep under ground, and makes a nest, with feathers and sea-plants; is monogamous, and lodges there the whole night with its mate. It lays one white egg, the end of May or beginning of June, which alone is thought fit to be eaten, the flesh of the bird itself being insipid and hard. It feeds on crabs, shrimps, and shell-fish, which last it forces from the rocks with its strong bill. Pallas remarks, that the Kamtschatkan girls imitate the tufts of these birds, which nature has supplied them

with, by placing a similar strip of the white skin of the glutton behind each ear, hanging down behind by way of ornament; and is a well-received present from a lover to his mistress. The bills both of this and the common puffin were formerly held by the natives as a charm, and worn by the priests as amulets; indeed at the present these have been seen fixed round their head-dresses, but supposed now to be only esteemed as mere ornaments: the skins are however made use of for clothing, being sewed together. It is called in Kamtschatka, *Muechagatka*; and in Oschotka, *Igilma*.

7. The pittacula, or perroquet auk, of Dr Pallas, is about the size of the little auk. The bill is much compressed on the sides, in shape convex both above and below, and of a bright red colour: from the remote corner of each eye is a very slender tuft of fine white feathers, hanging down the neck: the head and upper part of the body are dusky; the lower whitish, varied with black edges: the legs are of a dirty yellow; and the webs dusky. This species is found at Kamtschatka, in the isles towards Japan, and on the western shores of America. They are sometimes seen in flocks, but seldom far from land, except driven by storms. Of nights they harbour in the crevices of rocks. They lay an egg almost the size of a hen's, of a dirty white or yellowish colour spotted with brown; which they do about the middle of June, upon the bare rock or sand, for they make no nest. Like most of the tribe, they are stupid birds, as may be evinced by the ridiculous method of catching them:—One of the natives places himself under a loose garment of fur, of a particular make, with large open sleeves, among the rocks, at evening; when the birds, returning to their lodging-places at dusk, run under the skirts, and up the arm-holes, for shelter during the night; and thus become an easy prey. Their stupidity likewise occasions them to fly aboard a ship at such times, mistaking it for a roofing-place; whereby navigators have been taught to avoid the danger of falling in too near with land, either of evenings, or on approaching storms. The eggs are esteemed good.

ALCÆUS, a famous ancient lyric poet, born at Mitylene, in the island of Lesbos. Horace seems to think him the inventor of this kind of poetry:

Now the Roman muse inspire,
And warm the song with Grecian fire. *Francis.*

He flourished in the 44th Olympiad, at the same time with Sappho, who was likewise of Mitylene. Alcæus was a great enemy to tyrants, but not a very brave soldier. He was present at an engagement, wherein the Athenians gained a victory over the Lesbians; and here, as he himself is said to have confessed in one of his pieces, he threw down his arms, and saved himself by flight. Horace, who, of all the Latin poets, most resembled Alcæus, has made the like confession:

With thee I saw Philippi's plain,
Its fatal rout, a fearful scene!
And dropp'd, alas! th' inglorious shield,
Where valour's self was forc'd to yield;
Where foil'd in dust the vanquish'd lay,
And breath'd th' indignant soul away. *Francis.*

The poetical abilities of Alcæus are indisputed; and
Z z though

Alcæus,
Alcaics.

though his writings were chiefly in the lyric strain, yet his muse was capable of treating the sublimest subjects with a suitable dignity. Hence Horace says,

Alcæus strikes the golden strings,
And seas, and war, and exile, sings.
Thus while they strike the various lyre,
The ghosts the sacred sounds admire :
But when Alcæus lifts the strain
To deeds of war and tyrants slain,
In thicker crowds the shadowy throng
Drink deeper down the martial song. *Francis.*

ALCÆUS, an Athenian tragic poet, and, as some think, the first composer of tragedies. He renounced his native country Mitylene, and passed for an Athenian. He left ten pieces, one of which was *Pasiphaë*, that which he produced when he disputed with Aristophanes, in the fourth year of the 97th Olympiad.

There is another ALCÆUS mentioned in Plutarch, perhaps the same whom Porphyrius mentions as a composer of satirical iambics and epigrams, and who wrote a poem concerning the plagiarism of Euphorus the historian. He lived in the 145th Olympiad.

We are told likewise of one ALCÆUS, a Messenian, who lived in the reign of Vespasian and Titus. We know not which of these it was who suffered for his lewdness a very singular kind of death, which gave occasion to the following epitaph :

Ἀλκαίου ταφος ἕτος, &c.

This is Alcæus's tomb ; who died by a radish,
The daughter of the earth, and punisher of Adulterers.

This punishment inflicted on adulterers, was thrusting one of the largest radishes up the anus of the adulterer : or, for want of radishes, they made use of a fish with a very large head, which Juvenal alludes to :

Quosdam mæchos et mugilis intrat. Sat. x.
The mullet enters some behind.

Hence we may understand the menace of Catullus,

*Ah! tum te miserum, malique sati,
Quem attractis pedibus, patente porta,
Percurrent raphanisque magilesque. Epig. xv.*
Ah! wretched thou, and born to luckless fate,
Who art discover'd by the unshut gate!
If once, alas! the jealous husband come,
The radish or the sea-fish is thy doom.

ALCAICS, in ancient poetry, a denomination given to several kinds of verse, from Alcæus, their inventor.

The first kind consists of five feet, viz. a spondee, or iambic ; an iambic ; a long syllable ; a dactyle ; another dactyle : such is the following verse of Horace,

*Omnis | eodem cogimur, | omnium
Versa | tur ur | ni | serius | ocys |
Sors exitura.*

The second kind consists of two dactyles and two trochees : as,

Exillum | impos | tura | cymbæ.

Besides these two, which are called *dactylic Alcaics*, there is another styled simply *Alcaic* ; consisting of an epitrite ; a choriambus ; another choriambus ; and a bacchius : the following is of this species,

Cur timet fluvium Tiberim | tangere, cur | olivum ?

Alcaic Ode, a kind of manly ode composed of several strophes, each consisting of four verses ; the two first of which are always Alcaics of the first kind ; the third verse is a diameter hypercatalectic, or consisting of four feet and a long syllable ; and the fourth verse is an Alcaic of the second kind. The following strophe is of this species, which Horace calls *minaces Alcai camena*.

*Non possidentem multa vocaveris
Recte beatum : rectius occupat
Nomen beati, qui deorum
Muneribus sapienter uti, &c.*

ALCAID, ALCAYDE, or ALCALDE, in the polity of the Moors, Spaniards, and Portuguese, a magistrate, or officer of justice, answering nearly to the French provost and the British justice-of-peace.—The alcaid among the Moors is vested with supreme jurisdiction, both in civil and criminal cases.

ALCALA DE GUADEIRA, a small town of Spain, in Andalusia, upon the river Guadeira. Here are a abundance of springs, from whence they convey water to Seville by an aqueduct. W. long. 6. 16. N. lat. 37. 15.

ALCALA de Henares, a beautiful and large city of Spain, in New Castile, seated upon the river Henares, which washes its walls. It is built in a very agreeable plain, and is of an oval figure. The streets are handsome and pretty straight ; one of them is very long, running from one end of the city to the other. The houses are well built ; and there are several squares, the largest of which is an ornament to the city ; it is surrounded on all sides with piazzas, where tradesmen have their shops, to expose several sorts of commodities to sale, of which there is as great plenty and variety as in most towns of Spain. The university was founded by cardinal Ximenes, archbishop of Toledo, about the beginning of the 16th century. The land about Alcalá is watered by the Henares, well cultivated, and very fruitful, while that at a distance is dry and sterile : it yields grain in plenty, very good muscat wine, and melons of a delicious kind. Without the walls is a spring, the water of which is so pure and so well tasted, that it is inclosed and shut up for the king of Spain's own use, from whence it is carried to Madrid.—This city is 10 miles south-west of Guadalaxara, and 13 miles east of Madrid. W. long. 4. 20. N. lat. 40. 30.

ALCALA-Real, a small city of Spain, in Andalusia, with a fine abbey. It is built on the top of a high mountain, in a mountainous country ; and the road to it is incommodious, rough, and unequal ; but to make amends for this, here are several kinds of exquisite fruit and wine. W. Long. 4. 15. N. Lat. 37. 18.

ALCALY, or ALCALI, or ALKALI. See CHEMISTRY, *Index*.

ALCANIS, a town of Arragon in Spain, seated on the river Gaudaloup, twelve miles from Caspe. It was formerly the capital of the kingdom of the Moors ; but being taken from them, it was made a commandery of the order of Calatrava. Here is a very remarkable fountain, which throws up water through 42 pipes. It is surrounded with gardens and fruit-trees, and defended with a good fortress. W. Long. 0. 5. N. Lat. 41. 0.

ALCANNA, in commerce, a powder prepared from the

Alcaic
||
Alcanna.

Alcantara
||
Alcassar.

the leaves of the Egyptian privet, in which the people of Cairo drive a considerable trade. It is much used by the Turkish women to give a golden colour to their nails and hair. In dyeing, it gives a yellow colour when steeped with common water, and a red one when infused in vinegar. There is also an oil extracted from the berries of alcanna, and used in medicine as a calmer.

ALCANTARA, a small, but very strong city of Estremadura, in Spain. It gives name to one of the three orders of knighthood. It is seated on the banks of the Tajo, or Tagus, 21 miles from Coria, in a very fruitful soil, and is celebrated for its bridge over that river. This was built in the time of the emperor Trajan, as appears by an inscription over one of the arches, by the people of Lusitania, who were assailed to supply the expence. It is raised 200 feet above the level of the water; and though it consists but of six arches, is 670 feet in length, and 28 in breadth. At the entrance of the bridge, there is a small antique chapel hewn in a rock by the ancient Pagans, who dedicated it to Trajan, as the Christians did to St Julian. This city was built by the Moors, on account of the convenience of this bridge; which is at a place where the Tajo is very deep, running between two high steep rocks: for this reason, they called it *Al-Cantara*, which, in their language, signifies *the Bridge*. It was taken from them in 1214, and given to the knights of *Calatrava*, who afterwards assumed the name of *Alcantara*. It was taken by the Earl of Galloway, in April, 1706, and retaken by the French in November following. It is 45 miles from Madrid, and 125 from Seville. W. Long. 7. 12. N. Lat. 39. 30.

Knights of ALCANTARA, a military order of Spain, which took its name from the above-mentioned city. They make a very considerable figure in the history of the expeditions against the Moors. The knights of Alcantara make the same vows as those of Calatrava, and are only distinguished from them by this, that the cross fleur de lys, which they bear over a large white cloak, is of a green colour. They possess 37 commanderies. By the terms of the surrender of Alcantara to this order, it was stipulated, that there should be a confraternity between the two orders, with the same practices and observances in both; and that the order of Alcantara should be subject to be visited by the grand-master of Calatrava. But the former soon released themselves from this engagement, on pretence that their grand-master had not been called to the election of that of Calatrava, as had been likewise stipulated in the articles. After the expulsion of the Moors, and the taking of Granada, the sovereignty of the order of Alcantara and that of Calatrava was settled in the crown of Castile by Ferdinand and Isabella.—In 1540, the knights of Alcantara sued for leave to marry, which was granted them.

ALCAREZ, a small city of La Mancha, in Spain, defended by a pretty strong castle, and remarkable for an ancient aqueduct. It stands near the river Guardamena, and the soil about it is very fruitful. They have a breed of little running-horses, which are very fleet and strong. It is 25 miles north of the confines of Andalusia, 108 south of Cuenza, and 138 south-by-east of Madrid. W. Long. 1. 50. N. Lat. 38. 28.

ALCASSAR DO SAL, a town of Portugal, in Estre-

madura, which has a castle said to be impregnable. It is indeed very strong, both by art and nature, being built on the top of a rock which is exceedingly steep on all sides. Here is a salt-work which produces very fine white salt, from whence the town takes its name. The fields produce large quantities of a sort of rushes, of which they make mats, which are transported out of the kingdom. W. Long. 9. 10. N. Lat. 38. 18.

ALCASSAR, a city of Barbary, seated about two leagues from Larache, in Afga, a province of the kingdom of Fez. It was of great note, and the seat of the governor of this part of the kingdom. It was built by Jacob Almanzor, king of Fez, about the year 1180, and designed for a magazine and place of rendezvous for the great preparations he was making to enter Granada in Spain, and to make good the footing Joseph Almanzor had got some time before. It is said his father first invaded Spain with 300,000 men, most of whom he was obliged to bring back to Africa to quiet a rebellion that had broke out in Morocco. This done, he returned to Spain again with an army, as is said, of 200,000 horse and 300,000 foot. The city is now fallen greatly to decay, so that of fifteen mosques there are only two that they make use of. The reason, probably, is the bad situation of the town; for it stands so low, that it is excessively hot in summer, and almost overflowed with water in the winter. This they affirm to be owing to a curse of one of their saints. Here are a great number of monks, who live very familiarly with the people, walking about the town, possessing the tops of the houses and mosques without molestation; for they esteem them sacred birds, and account it sinful to disturb them. At present, the bashaw of Tetuan appoints a governor to this town, which is the last of his dominions towards Mequinez. Near this city there is a high ridge of mountains, running towards Tetuan, whose inhabitants were never brought entirely under subjection; and whenever it was attempted, they revenged themselves by infesting the roads, and robbing and destroying the travellers. When they were pursued, they retired into their woody mountains, where none could safely follow them. Not far from hence is the river Elmahaffen, famous for the battle fought between Don Sebastian king of Portugal and the Moors; in which the Portuguese were defeated and their king slain. W. Long. 12. 35. N. Lat. 35. 15.

ALCAVALA, in the Spanish finances, was at first a tax of ten per cent. afterwards of fourteen per cent. and is at present of only six per cent. upon the sale of every sort of property, whether moveable or immoveable; and it is repeated every time the property is sold. The levying of this tax requires a multitude of revenue-officers sufficient to guard the transportation of goods, not only from one province to another, but from one shop to another. It subjects not only the dealers in some sorts of goods, but those in all sorts, every farmer, every manufacturer, every merchant and shopkeeper, to the continual visits and examination of the tax-gatherers. Through the greater part of a country in which a tax of this kind is established, nothing can be produced for distant sale. The produce of every part of the country must be proportioned to the consumption of the neighbourhood. It is to the Alcavala, accordingly, that Ufartiz imputes the ruin of the manufactures of Spain. He might have imputed

Alcassar,
Alcavala.

Alcazar
||
Alcea.

ted to it likewise the declension of agriculture, it being imposed not only upon manufactures, but upon the rude produce of the land.

ALCAZAR **LEGUER**, a town of Africa, in the kingdom of Fez, and in the province of Ilabat. It was taken by Alphonso, king of Portugal, in 1468; but soon after that, it was abandoned to the Moors. It is seated on the coast of the straits of Gibraltar. W. Long. 5. 30. N. Lat. 38. 0.

ALCAZER, a town of Spain, in New Castile, seated on the river Guardamana, which has a fortress on a high hill for its defence, and lies in a very fruitful country. It is 100 miles north-west of Carthage. W. Long. 2. 10. N. Lat. 38. 15.

ALCE, **ALCES**, or **ELK**, in zoology; the trivial name of a species of the cervus, belonging to the order of mammalia peccora. See **CERVUS**.

ALCEA, the **HOLLY-HOCK**: A genus of the polyandria order, belonging to the monodelphia class of plants; and in the natural method ranking under the 37th order, *Columniferae*. The characters are: The calyx is a double perianthium, monophyllous and persistent; the exterior one six-cleft, the interior half five-cleft: The corolla consists of five petals, coalesced at the base, heart-shaped inversely, and expanding: The stamina consist of numerous filaments, coalesced below into a five-cornered cylinder, loose above, and inserted into the corolla; the antheræ are kidney-shaped: The pistillum has a roundish germen; a short cylindrical stylus; and numerous bristly stigmata the length of the stylus: The pericarpium consists of many arilli, jointed into a verticillum about a columnar depressed receptacle: The seeds are solitary, reniform, and depressed.

Species. Although Linnæus mentions two distinct species of this genus, viz. the *rosea* and *ficifolia*, he thinks, that the latter may perhaps be only a variety of the former; but Mr Miller affirms them to be distinct species, whose difference in the form of their leaves always continues. The leaves of the first sort are roundish, and cut at their extremities into angles; those of the second are deeply cut into six or seven segments, so as to resemble a hand. Cultivation produces almost an infinite variety of this plant, such as double-flowered, single-flowered, deep red, pale red, blackish red, white, purple, yellow, and flesh-colour. The first species is a native of China, the second grows also in Itria. Tho' natives of warm countries, they are hardy enough to thrive in the open air in Britain, and have for many years been some of the greatest ornaments in gardens, towards the end of summer; but they have the inconvenience of growing too large for small gardens, and requiring tall stakes to secure them from being broken by strong winds. In large gardens, however, when properly disposed, they make a fine appearance; for as their spikes of flowers grow very tall, there will be a succession of them on the same stems more than two months: the flowers on the lower part of the spike appear in July; and as their stalks advance, new flowers are produced till near the end of September. When planted in good ground, the stalks will often rise to the height of eight or nine feet; so that near six feet of each will be garnished with flowers, which, when double and of good colours, make a very beautiful appearance.

Culture. The holly-hock is propagated by seeds,

which should be carefully saved from those plants whose flowers are double and of the best colours: for though the duplicity of the flowers, as well as their colour, are only accidental properties, yet the young plants will produce nearly the same kind of flowers with those from which the seeds are taken, provided no plants with single or bad-coloured flowers are permitted to grow near them; and as soon as such appear they ought to be removed from the good ones, that their farina may not spread into the others, which would cause them to degenerate. The seeds ought to be gathered very dry, and remain in their capsules until spring; but care must be taken that no wet comes to them in winter, otherwise the covers would turn mouldy, and spoil their contents.—They should be sown in drills, about the middle of April, on a bed of light earth, and covered with earth of the same kind about half an inch deep. When the plants have put out six or eight leaves, they should be transplanted into nursery-beds, observing to water them until they have taken good root; after which they will require no farther care, but to keep them clean from weeds till October, when they should be transplanted where they are to remain.

ALCEDO, or **KINGSFISHER**, in ornithology, a genus of the order of picæ. The alcedo has a long, frait, thick, triangular bill; with a fleshy, plain, short, flat tongue.

Of this genus there are a great many species, with one or other of which almost every part of the world is furnished. Most of them frequent rivers, and live on fish, the singularity of catching which is admirable: sometimes hovering over the water, where a shoal of small fishes is seen playing near the surface; at other times waiting with attention, on some low branch hanging over the water, for the approach of a single one who is so unlucky as to swim that way; in either case dropping like a stone, or rather darting with rapidity on his prey; when, seizing it crosswise in his bill, it retires to a resting place to feast on it; which it does piecemeal, bones and all, without reserve, afterwards bringing up the indigestible parts in pellets, like birds of prey. The wings of most of the genus are very short; yet the birds fly rapidly, and with great strength. It may be remarked, that throughout this genus, blue, in different shades, is the most predominant colour.—The species found in the South Sea Islands are held in a kind of superstitious veneration by the natives of the places they severally inhabit, perhaps on account of their being frequently seen flying about the morais or burial-places. That which inhabits Otaheite, where it is called *Erooro*, is accounted particularly sacred, and not allowed to be taken or killed.

1. The *ispida*, or common kingsfisher, is not much larger than a swallow; its shape is clumsy; the bill disproportionably long; it is two inches from the base to the tip; the upper chap black, and the lower yellow. But the colours of this bird atone for its inelegant form: the crown of the head and the coverts of the wings are of a deep blackish green, spotted with bright azure: the back and tail are of the most resplendent azure; the whole under-side of the body is orange-coloured; a broad mark of the same passes from the bill beyond the eyes; beyond that is a large white spot: the tail is short, and consists of twelve feathers of a rich deep blue;

Alcedo.

Alcedo. blue; the feet are of a reddish yellow, and the three joints of the outmost toe adhere to the middle toe, while the inner toe adheres only by one.

From the diminutive size, the slender short legs, and the beautiful colours of this bird, no person would be led to suppose it one of the most rapacious little animals that skims the deep. Yet it is for ever on the wing, and feeds on fish; which it takes in surprising quantities, when we consider its size and figure. It takes its prey after the manner of the osprey, balancing itself at a certain distance above the water for a considerable space, then darting into the deep, and seizing the fish with inevitable certainty. While it remains suspended in the air, in a bright day, the plumage exhibits a beautiful variety of the most dazzling and brilliant colours. This striking attitude did not escape the notice of the ancients; for Ibycus, as quoted by Athenæus, styles these birds *αλκυονες πανσιπτεροι*, the halcyons with expanded wings. It makes its nest in holes in the sides of the cliffs, which it scoops to the depth of three feet; and lays from five to nine eggs, of a most beautiful semitransparent white. The female begins to lay early in the season, and excludes her first brood about the beginning of April. The male, whose fidelity exceeds even that of the turtle, brings her large provisions of fish while she is thus employed; and she, contrary to most other birds, is found plump and fat at that season. The male, that used to twitter before this, now enters the nest as quietly and as privately as possible. The young ones are hatched at the expiration of 20 days; but are seen to differ as well in their size as in their beauty.

This species is the *αλκυοναζωον*, or mute halcyon of Aristotle, which he describes with more precision than is usual with that great philosopher. After his description of the bird follows that of its nest; than which the most inventive of the ancients have delivered nothing that appears at first sight more fabulous and extravagant. He relates, that it resembled those concretions that are formed by the sea-water; that it resembled the long-necked gourd; that it was hollow within; that the entrance was very narrow, so that, should it overset, the water could not enter; that it resisted any violence from iron, but could be broke with a blow from the hand; and that it was composed of the bones of the *βελονη*, or sea-needle. The nest had medicinal virtues ascribed to it; and from the bird was called *Halcyoneum*. In a fabulous age, every odd substance that was flung ashore received that name; a species of tubular coral, a sponge, a zoophite, and a miscellaneous concrete, having by the ancients been dignified with that title from their imaginary origin*. Yet much of this seems to be founded on truth. The form of the nest is justly described; and the materials which Aristotle says it was composed of, are not entirely of his own invention. Whoever has seen the nest of the kingfisher, will observe it strewn with the bones and scales of fish; the fragments of the food of the owner and its young.—On the foundation laid by the philosopher, succeeding writers formed other tales extremely absurd; and the poets, indulging the powers of imagination, dressed the story in all the robes of romance. This nest was a floating one:

Incubat *halcyone* pendentibus æquore nidis.

ΟVID. Met. lib. xi.

It was therefore necessary to place it in a tranquil sea, and to supply the bird with charms to allay the fury of a turbulent element during the time of its incubation; for it had, at that season, power over the seas and the winds.

Χ' αλκυονος ερησιεντι τα κυματα, την τε θαλασσαν,
Τον τε νοτον, τον τ' ευρον, ος εσχατα φοκια κινει'
Αλκυονες, γλαυκαις Νηρησι ται τε μαλιστα
Ορειδων επιλαθεν. THEOCRIT. Idyl. vii. l. 57.

May *Halcyons* smooth the waves, and calm the seas,
And the rough south-east sink into a breeze;
Halcyons, of all the birds that haunt the main,
Most lov'd and honour'd by the *Nereid* train.

FAWRES.

These birds were equally favourites with *Thetis* as with the *Nereids*;

Dilectæ *Thetidi* *Halcyones*. VIRG. Georg. I. 399.

as if to their influence these deities owed a repose in the midst of the storms of winter, and by their means were secured from those winds that disturb their submarine retreats, and agitated even the plants at the bottom of the ocean.

Such are the accounts given by the Roman and Sicilian poets. Aristotle and Pliny tells us, that this bird is most common in the seas of Sicily: that it fat only a few days, and those in the depth of winter; and during that period the mariner might sail in full security; for which reason they were styled *Halcyon days*.

Perque dies placidos hiberno tempore septem
Incubat *Halcyone* pendentibus æquore nidis:
Tum via tuta maris: ventos custodit, et arcet
Æolus egressu. OVID. Met. lib. xi.

Alcyone, compressed,

Seven days sits brooding on her watery nest,
A wintry queen; her fire at length is kind,
Calms every storm, and lushes every wind.

DRYDEN.

In after-times, these words expressed any season of prosperity: these were the *Halcyon days* of the poets; the brief tranquillity, the *septem placidi dies*, of human life.

The poets also made it a bird of song. Virgil seems to place it in the same rank with the linnet;

Littoraque *Halcyonem* resonant, et *Acanthida* dum.
GEORG. III. 338.

And Silius Italicus celebrates its music, and its floating nest:

Cum sonat *Halcyone* cantu, nidisque natantes
Immota gestat sopitis fluctibus unda. Lib. xiv. 275.

But these writers seem to have transferred to our species, the harmony that belongs to the *vocal alcedo**, one of the lost birds of the ancients.

As the ancients have had their fables concerning this bird, so have the modern vulgar. It is an opinion generally received among them, that the flesh of the kingfisher will not corrupt, and that it will even banish all vermin. This has no better foundation than that which is said of its always pointing, when hung up dead, with its breast to the north. The only truth which can be affirmed of this bird when killed is, that its

* Arist. Hist. anat. 892.

* Plin. lib. xxxii. c. 8. Diosc. lib. v. c. 94.

Alcedo. its flesh is utterly unfit to be eaten; while its beautiful plumage preserves its lustre longer than that of any other bird we know.

This bird is found not only in Britain, but throughout Europe, Asia, and Africa; as specimens have been received from both China, Bengal, and Egypt. Belon also remarks his having met with it in Romania and Greece; and Scopoli notices it as a bird of Carniola, where he says it remains the whole year as in England. Indeed it bears the rigours of the colder climates so well, that among the Germans it has gained the name of *Eisvogel*, or *Ice Bird*: Olinia speaks also of its not regarding the ice and cold; and Gmelin assures us, that it is found even in Tartary and Siberia. But, however this may be, there are few winters in which many of these birds do not perish, apparently from cold alone; as several have been found frozen stiff by the sides of even running water, without the least mark of violence about them. M. D'Aubenton has kept these birds for several months, by means of small fish put into basons of water, on which they have fed; for on experiment they have refused all other kinds of nourishment.

2. The rudis, or Egyptian kingsfisher, as described by Hasselquist, is the size of the Royston crow. The bill is blackish, more than half an inch broad at the base, and two inches in length: the head, shoulders, and back, are brown, marked with oblong ferruginous spots: the throat is of a ferruginous white: the belly and thighs are whitish, marked with longitudinal broadish cinereous spots: upper tail coverts are quite white: the quills spotted with white on the inner webs, chiefly at the tips: the tail is ash-coloured: the legs are of a pale green; and the claws blackish. It inhabits lower Egypt, about Cairo; builds in sycamore and date trees; and feeds on frogs, insects, and small fish, which last it meets with in the fields when they are overflowed. Its cry is not unlike that of the common crow.

3. Le taparara of Buffon is about the size of a starling. The upper mandible of the bill is black, the lower red: the hind part of the neck, the back, and scapulars, are of an elegant blue; the rump and upper tail coverts bright beryl-blue: the under parts of the body are white; the wing coverts blue; and the legs red. Inhabits Cayenne and Guiana, at which last place the natives call all the kingsfisher tribe by the name *Taparara*. In this part of South America, which contains many rivers full of fish, kingsfishers, as might be expected, abound in vast numbers: but what is remarkable, they never herd together, always being found single, except in breeding-time, which is about the month of September. They lay their eggs in the holes of banks, like the kingsfisher of Europe. The cry of this bird imitates the word *Carac*.

4. The torquata, or cinereous kingsfisher, is about the size of a magpie, and fifteen inches and a half in length. The bill is three inches and a half long, and brown; the base of the lower mandible reddish: the head is crested: the upper parts of the head and body are blueish ash; the under parts chestnut: the throat is whitish, descending down the neck, and passing behind like a collar, ending towards the back in a point: the under tail coverts are of a pale fulvous, transversely striated with black: lesser wing coverts varied with blueish, ash, black, and yellowish: the legs are red;

and the claws blackish. It inhabits Martinico and Mexico; at which last it is called *Achalactli*. This bird migrates into the northern parts of Mexico at certain seasons only, and is supposed to come there from some hotter parts.

[The jacamars are much allied to this genus, and have been ranked under it by Linnæus: Their toes are, however, differently placed; their food also is different, being insects alone, and not fish; and their haunts are different, being moist woods, and not shores or the banks of rivers.]

5. The galbula, or green jacamar, is about the size of a lark. The bill is black, of a square form, a little incurvated and sharp at the point: the plumage in general, in the upper part of the body; is of a most brilliant green, glossed with copper and gold in different lights: the belly, throat, and vent, are rufous: the tail is composed of ten feathers, and shaped like a wedge: the legs are of a greenish yellow, very short and weak; the claws are black. This species is found both in Guiana and Brasil, in the moist woods, which it prefers to the more dry spots, for the sake of insects, on which it feeds. It is seldom seen except single, as it is a very solitary bird, keeping for the most part in the thickest parts; its flight quick, but short; perches on branches of a middling height, where it sits all night, and frequently part of the day, without stirring. Though these birds are solitary, yet they are far from scarce, as many may be met with. They are said to have a short and agreeable note. The natives of Guiana call this bird *Venetore*, and the Creoles, *Colibri des grands bois*. At Brasil their flesh is eaten by some.

6. The paradisea, or paradise jacamar, is of the same size with the former, and has a similar bill: the throat, fore part of the neck, and under wing coverts, are white: the rest of the plumage is of a deep dull green, in some lights appearing almost black, in others with a slight gloss of violet and copper bronze: the tail is composed of twelve feathers of unequal lengths: the two middle ones longest: the legs are black: the toes are placed two before and two behind, and pretty much united. It inhabits Surinam; and like the others, it feeds on insects; and sometimes, contrary to them, frequents open places. It flies farther at a time, and perches on the tops of trees: It is frequently found with a companion, not being quite so solitary a bird as the other. It also differs in the note, having a kind of soft whistle often repeated, but not heard a great way off.

Above 30 other species have been described by ornithologists.

ALCHEMILLA, or LADIES-MANTLE: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 35th order *Senticose*. The *calyx* is a single-leav'd perianthium, tubular, and persistent; the mouth flat, and eight-parted: There is no *corolla*. The *stamina* consist of four small erect subulated filaments placed in the mouth of the calyx; the antheræ are roundish: The *pistillum* has an egg-shaped *germen*: The *stylus* is filiform, the length of the stamina, and inserted at the base of the germ: The stigma is globular. There is no *pericarpium*, but the neck of the calyx closed. The *seed* solitary, elliptical, and compressed. Of this genus there are three

Species.

Alchemist,
Alchemy.

Species. 1. The vulgaris, or common ladies-mantle, with leaves plaited like a fan, and yellowish-green blossoms. It grows naturally in pasture-lands in this as well as in most other countries in Europe. The leaves discover to the taste a moderate astringency; and were formerly much esteemed in some female weaknesses, and in fluxes of the belly. They are now rarely made use of, tho' both the leaves and roots might doubtless be of service in cases where mild astringents are required. In the province of Smolandia in Gothland, they make a tincture of the leaves, and give it in spasmodic or convulsive diseases. Horses, sheep, and goats, eat it; cows are not fond of it; swine refuse it.—2. The alpina, or cinque-foil ladies-mantle, with finger-shaped sawed leaves, and greenish blossoms. It is a native of the mountainous parts of Europe. Goats and cows eat it; horses, sheep, and swine, refuse it.—3. The minor, or least ladies-mantle, with five smooth leaves growing at a joint and cut into many segments. It grows naturally in Sweden, Lapland, and other cold countries. Eaten by cows and goats; refused by horses, sheep, and swine.

Culture. These plants have perennial roots, and annual stalks. They are easily propagated by parting of their roots, or sowing their seeds in autumn. They should have a moist soil and shady situation, and be kept clean from weeds; which is all the culture they require.

ALCHEMIST, a practitioner in alchemy.

ALCHEMY, that branch of chemistry which had for its principal objects the transmutation of metals into gold; the panacea, or universal remedy; an alkalest, or universal menstruum; an universal ferment; and many other things equally ridiculous.

Kircher, instructed in all the secrets of chemistry, has fully exposed the artifices and impostures of alchemists. An alchemist puts into a crucible the matter which is to be converted into gold; this he sets on the fire, blows it, stirs it with rods; and, after divers operations, gold is found at the bottom of the crucible, instead of the matter first put in: this there are a thousand ways of effecting, without any transmutation. Sometimes it is done by dexterously dropping in a piece of gold concealed between the fingers, sometimes by casting in a little of the dust of gold or silver disguised under the appearance of some elixir, or other indifferent matter; sometimes a crucible is used which has a double bottom, and gold put between the two; sometimes the rod used to stir the matter is hollow, and filled with the dust of the metal desired; at other times there is metal mixed with the charcoal, the ashes of the furnace, or the like. Mr Harris very properly distinguishes from alchemy and chemistry; and defines the former to be *ars sine arte, cujus principum est mentiri, medium laborare, et finis mendicare*; and the Italians have a proverb, *non ti fidiare al chemista povero o medico amalato*. The ruin which has attended this delusion has occasioned several states to make severe laws against pretences to alchemy. The Romans formerly banished all such as professed it; and the sacred canons likewise directed the thunder of their censure against them. Dioclesian and Cæsar directed all books which treated of this subject to be burnt. Rymer furnishes us with a licence for practising alchemy, with all kinds of metals and minerals, granted to one

Richard Carter in the 1476; *Rym. Fæd.* tom. xii. Nevertheless, we have had severe laws against alchemy, and multiplying of metals, as much so as against coining itself.

Alciat
||
Alcmaer.

ALCIAT (Andrew), a great lawyer, who flourished in the 16th century, born at Milan. He mixed much of polite learning in the explication of the laws, and happily drove out the barbarity of language which till then had reigned in the lectures and writings of lawyers; for which Thuanus highly praises him. He published a great many law-books, and some notes upon Tacitus. His Emblems have been much admired, and translated into French, Italian, and Spanish; and several learned men have written commentaries on them.

ALCIBIADES, an Athenian general. It was the fate of this great man to live at a time when his country was a scene of confusion. The Greeks, grown insolent from their conquests in Persia, turned their army against each other, and banded together under the conduct of the two most opulent states Athens and Lacedæmon. Alcibiades, in the midst of an expedition he had planned against the enemy of his country, was recalled home to answer some charge of a private nature; but fearing the violence of his enemy, instead of going to Athens, he offered his services at Sparta, where they were readily accepted. By his advice the Lacedæmonians made a league with Persia, which gave a very favourable turn to their affairs. But his credit in the republic raising jealousies against him, he privately reconciled himself to his country, and took again the command of an Athenian army. Here victory, waiting as it were at his command, attended all his motions. The loss of seven battles obliged the Spartans to sue for peace. He enjoyed his triumphs, however, only a short time at Athens. One unsuccessful event made him again obnoxious to the malice of his citizens; and he found it expedient to retire from Athens. In his absence the Spartans again took the lead, and at the fatal battle of Ægos entirely subdued the Athenian power. Alcibiades, though an exile, endeavoured to restore the power of his country; of which the Spartans having intelligence, procured him to be assassinated. He was a man of admirable accomplishments, but indifferently principled; of great parts; and of an amazing versatility of genius.

ALCINOUS, king of the Phœnicians, in the island now called *Corfu*, was son of Nautilus, and grandson of Neptune and Peribea. It is by his gardens this king has chiefly immortalized his memory. He received Ulysses with much civility, when a storm had cast him on his coast. The people here loved pleasure and good cheer, yet were skilful seamen; and Alcinous was a good prince.

ALCMAER, a city of the United Provinces, seated in North Holland, about four miles from the sea, 15 from Haerlem, and 18 from Amsterdam. It is a handsome city, and one of the cleanest in Holland. The streets and houses are extremely neat and regular, and the public buildings very beautiful. It had formerly two parish-churches, dedicated to St Matthew and St Lawrence. The latter had so high a tower, that it served for a sea-mark to the vessels that were in the open sea; but, in 1464, it tumbled down, and damaged the other church so much, that they were both

Alcman
||
Alcock.

both demolished in 1470, and one church was built in their stead, dedicated to the same saints. The Spaniards, under the command of Frederic of Toledo, son of the duke d'Alva, came to besiege it, after they had taken Haerlem in 1573; but were forced to raise the siege, after three months lying before it, as well on account of the infection of the air as the stout resistance of the inhabitants and foldiers; even the women signaling themselves bravely in its defence. It is recorded in the register of this city, that, in the year 1637, 120 tulips, with the off-sets, sold for 90,000 florins. The town has a very good trade in butter and cheese, of which a vast quantity is sold every year, and is esteemed the best in Holland. E. long. 4. 26. N. lat. 52. 28.

ALCMAN, a lyric poet, who flourished in the 27th Olympiad. He was born at Sparta; and composed several poems, of which only some fragments are remaining, quoted by Athenæus and some other ancient writers. He was very amorous; accounted the father of gallant poesy; and is said to have been the first that introduced the custom of singing love-songs in company. He is reported to have been one of the greatest eaters of his age; upon which Mr Bayle remarks, that such a quality would have been extremely inconvenient, if poetry had been at that time upon such a footing as it has been often since, not able to procure the poet bread. He died of a strange disease; for he was eat up with lice.

ALCMANIAN, in ancient lyric poetry, a kind of verse consisting of two dactyles and two trochees; as,—
Virgini|bus pue|risque |canto.

The word is formed from *Alcman*, the name of an ancient Greek poet, in great esteem for his erotics or amorous compositions.

ALCMENA, the daughter of Electryo king of Mycenæ, and wife of Amphitryon. Jupiter putting on the shape of her husband while he was abroad in the wars, begot Hercules upon her: he made that night as long as three ordinary ones.

ALCOCK (John), doctor of laws, and bishop of Ely in the reign of king Henry VII. was born at Beverly in Yorkshire, and educated at Cambridge. He was first made dean of Westminster, and afterwards appointed master of the rolls. In 1471, he was consecrated bishop of Rochester: in 1476, he was translated to the see of Worcester; and in 1486, to that of Ely, in the room of Dr John Morton, preferred to the see of Canterbury. He was a prelate of great learning and piety; and so highly esteemed by king Henry, that he appointed him lord president of Wales, and afterwards lord chancellor of England. Alcock founded a school at Kingston upon Hull, and built the spacious hall belonging to the episcopal palace at Ely. He was also the founder of Jesus-college in Cambridge, for a master, six fellows, and as many scholars. This house was formerly a nunnery, dedicated to St Radigund: and, as Godwin tells us, the building being greatly decayed, and the revenues reduced almost to nothing, the nuns had all forsaken it, except two; whereupon bishop Alcock procured a grant from the crown, and converted it into a college. But Camden and others tell us, that the nuns of that house were so notorious for their incontinence, that king Henry VII. and pope Julius II. consented to its dissolution:

N^o 10.

Bale accordingly calls this nunnery *spiritualium meretricum canobium*, "a community of spiritual harlots." Bishop Alcock wrote several pieces; amongst which are the following: 1. *Mons Perfectionis*. 2. *In Psalmos Penitentiales*. 3. *Homilie Vulgares*. 4. *Meditationes Pie*. He died October 1. 1500; and was buried in the chapel he had built at Kingston upon Hull.

ALCOHOL, or ALKOOL, in chemistry, spirit of wine highly rectified †. It is also used for any highly rectified spirit.—Alcohol is extremely light and inflammable: It is a strong antiseptic, and therefore employed to preserve animal substances. † See *Chemistry* (Index), and *Pharmacy*.

ALCOHOL is also used for any fine impalpable powder.

ALCOHOLIZATION, the process of rectifying any spirit. It is also used for pulverization.

ALCOR, in astronomy, a small star adjoining to the large bright one in the middle of the tail of *ursa major*.—The word is Arabic. It is a proverb among the Arabians, applied to one who pretends to see small things, but overlooks much greater: *Thou canst see Alcor, and not yet see the full moon*.

ALCORAN, or AL-KORAN, the scripture, or bible, of the Mahometans. The word is compounded of the Arabic particle *al*, and *coran* or *koran*, derived from the verb *caraa* or *karaa*, to read. The word therefore properly signifies, *the reading*; or rather, *that which ought to be read*. By this name the Mahometans denote not only the entire book or volume of the Koran, but also any particular chapter or section of it; just as the Jews call either the whole scripture, or any part of it, by the name of *Karab*, or *Mikra*, words of the same origin and import.

Besides this peculiar name, the Koran is also honoured with several appellations common to other books of scripture: as, *al Farkan*, from the verb *foraka*, to divide or distinguish; not, as the Mahometan doctors say, because those books are divided into chapters or sections, or distinguish between good and evil; but in the same notion that the Jews use the word *Perek*, or *Pirka*, from the same root, to denote a section or portion of scripture. It is also called *al Meshaf*, the volume, and *al Kitah*, the book, by way of eminence, which answers to the *Biblia* of the Greeks; and *al Dhikr*, the admonition, which name is also given to the Pentateuch and Gospel.

The Koran is divided into 114 larger portions of very unequal length, which we call *chapters*; but the Arabians *sowar*, in the singular *sura*; a word rarely used on any other occasion, and properly signifying a row, order, or a regular series; as a course of bricks in building, or a rank of soldiers in an army; and is the same in use and import with the *Sura*, or *Tora*, of the Jews, who also call the fifty-three sections of the Pentateuch *Sedarim*, a word of the same signification.

These chapters are not, in the manuscript copies, distinguished by their numerical order, but by particular titles, which are taken sometimes from a particular matter treated of, or person mentioned therein; but usually from the first word of note, exactly in the same manner as the Jews have named their *Sedarim*; though the word from which some chapters are denominated be very far distant, towards the middle, or perhaps the end, of the chapter; which seems ridiculous. But the occasion of this appears to have been, that the verse or passage

passage wherein such word occurs, was, in point of time, revealed and committed to writing before the other verses of the same chapter which precede it in order; and the title being given to the chapter before it was completed, or the passages reduced to their present order, the verse from whence such title was taken did not always happen to begin the chapter. Some chapters have two or more titles, occasioned by the difference of the copies.

Some of the chapters having been revealed at Mecca, and others at Medina, the noting this difference makes a part of the title: but the reader will observe, that several of the chapters are said to have been revealed partly at Mecca and partly at Medina; and, as to others, it is yet a dispute among the commentators to which of the two places they belong.

Every chapter is subdivided into smaller portions, of very unequal length also, which we customarily call *verses*: but the Arabic word is *ayat*, the same with the Hebrew *otob*, and signifies *signs* or *wonders*: such as are the secrets of God, his attributes, works, judgments, and ordinances, delivered in those verses; many of which have their particular titles also, imposed in the same manner as those of the chapters.

Besides these unequal divisions of chapter and verse, the Mahometans have also divided their Koran into sixty equal portions, which they call *Abzab*, in the singular *Hizb*, each subdivided into four equal parts; which is also an imitation of the Jews, who have an ancient division of their Mishna into sixty portions called *Masseoth*. But the Koran is more usually divided into thirty sections only, named *Ajza*, from the singular *Joz*, each of twice the length of the former, and in the like manner subdivided into four parts. These divisions are for the use of the readers of the Koran in the royal temples, or in the adjoining chapels where the emperors and great men are interred. There are thirty of these readers belonging to every chapel, and each reads his section every day; so that the whole Koran is read over once a-day.

Next after the title, at the head of every chapter, except only the ninth, is prefixed the following solemn form, by the Mahometans called the *Bismallah*, IN THE NAME OF THE MOST MERCIFUL GOD; which form they constantly place at the beginning of all their books and writings in general, as a peculiar mark or distinguishing characteristic of their religion, it being counted a sort of impiety to omit it. The Jews, for the same purpose, make use of the form, *In the name of the LORD*, or, *In the name of the great GOD*; and the eastern Christians that of, *In the name of the Father, and of the Son, and of the Holy Ghost*. But Mahomet probably took this form, as he did many other things, from the Persian Magi, who used to begin their books in these words, *Benam Vezdan bakshai shgher dadar*; that is, *In the name of the most merciful just God*.

There are twenty-nine chapters of the Koran, which have this peculiarity, that they begin with certain letters of the alphabet, some with a single one, others with more. These letters the Mahometans believe to be the peculiar marks of the Koran, and to conceal several

profound mysteries; the certain understanding of which, the more intelligent confess, has not been communicated to any mortal, their prophet only excepted. Notwithstanding which, some will take the liberty of guessing at their meaning by that species of Cabala called by the Jews *Notarikon*, and suppose the letters to stand for as many words, expressing the names and attributes of God, his works, ordinances, and decrees; and therefore these mysterious letters, as well as the verses themselves, seem in the Koran to be called *signs*. Others explain the intent of these letters from their nature or organ, or else from their value in numbers, according to another species of the Jewish Cabala called *Gematria*; the uncertainty of which conjectures sufficiently appears from their disagreement. Thus, for example, five chapters, one of which is the second, begins with these letters, A. L. M. which some imagine to stand for *Allah latiff magid*, "God is gracious and to be glorified;" or, *Ana li minni*, i. e. *to me and from me*, viz. belongs all perfection, and proceeds all good; or else for *Ana Allah alam*, "I am the most wise God," taking the first letter to mark the beginning of the first word, the second the middle of the second word, and the third the last of the third word; or for *Allah, Gabriel, Mohammed*, the author, revealer, and preacher of the Koran. Others say, that as the letter A belongs to the lower part of the throat, the first of the organs of speech; L to the palate, the middle organ; and M to the lips, which are the last organ; so these letters signify that God is the beginning, middle, and end, or ought to be praised in the beginning, middle, and end, of all our words and actions: or, as the total value of those three letters, in numbers, is seventy-one, they signify, that, in the space of so many years, the religion preached in the Koran should be fully established. The conjecture of a learned Christian is at least as certain as any of the former, who supposes those letters were set there by the amanuensis, for *Anar li Mohammed*, i. e. *at the command of Mohammed*, as the five letters prefixed to the nineteenth chapter seem to be there written by a Jewish scribe, for *Coh yaas*, i. e. *Thus he commanded*.

The Koran is universally allowed to be written with the utmost elegance and purity of language, in the dialect of the tribe of Koreish, the most noble and polite of all the Arabians, but with some mixture, tho' very rarely, of other dialects. It is confessedly the standard of the Arabic tongue, and, as the more orthodox believe, and are taught by the book itself, inimitable by any human pen (though some sectaries have been of another opinion), and therefore insisted on as a permanent miracle, greater than that of raising the dead, and alone sufficient to convince the world of its divine original.

And to this miracle did Mahomet himself chiefly appeal for the confirmation of his mission, publicly challenging the most eloquent men in Arabia, which was at that time stocked with thousands whose sole study and ambition it was to excel in elegance of style and composition, to produce even a single chapter that might be compared with it (A).

(A) As the composition and arrangement of words, however, admit of infinite varieties, it can never be absolutely said that any one is the best possible. In fact, Hamzah Benahmed wrote a book against the Alcoran with at least equal elegance; and Moselema another, which even surpassed it, and occasioned a defection of a great part of the Mussulmans. *Journ. de Scav. tom. xiii. p. 280. Ouvr. de Scav. Nov. 1708, p. 404.*

Alcoran.

To the pomp and harmony of expression some ascribe all the force and effect of the Alcoran; which they consider as a sort of music, equally fitted with other species of that art to ravish and amaze. In this Mahomet succeeded so well, and so strangely captivated the minds of his audience, that several of his opponents thought it the effect of witchcraft, and enchantment, as he himself complains.—Others have attributed the effect of the Alcoran to the frequent mention of rewards and punishments; heaven and hell occurring almost in every page. Some suppose, that the sensual pleasures of paradise, so frequently set before the imaginations of the readers of the Alcoran, were what chiefly bewitched them. Tho', with regard to these, there is a great dispute whether they are to be understood literally or spiritually. Several have even allegorized the whole book.

The general design of the Koran was to unite the professors of the three different religions, then followed in the populous country of Arabia (who for the most part lived promiscuously, and wandered without guides, the far greater number being idolaters, and the rest Jews and Christians mostly of erroneous and heterodox belief), in the knowledge and worship of one God, under the sanction of certain laws, and the outward signs of ceremonies partly of ancient and partly of novel institution, enforced by the consideration of rewards and punishments both temporal and eternal; and to bring them all to the obedience of Mahomet, as the prophet and ambassador of God, who, after the repeated admonitions, promises, and threats, of former ages, was at last to establish and propagate God's religion on earth, and to be acknowledged chief pontiff in spiritual matters, as well as supreme prince in temporal.

The great doctrine then of the Koran, is the unity of God; to restore which point Mahomet pretended was the chief end of his mission; it being laid down by him as a fundamental truth, That there never was, nor ever can be, more than one true orthodox religion. For, though the particular laws or ceremonies are only temporary, and subject to alteration, according to the divine direction; yet the substance of it being eternal truth, is not liable to change, but continues immutably the same. And he taught, that, whenever this religion became neglected, or corrupted in essentials, God had the goodness to re-inform and re-admonish mankind thereof, by several prophets, of whom Moses and Jesus were the most distinguished, till the appearance of Mahomet, who is their seal, and no other to be expected after him. The more effectually to engage people to hearken to him, great part of the Koran is employed in relating examples of dreadful punishments formerly inflicted by God on those who rejected and abused his messengers; several of which stories, or some circumstances of them, are taken from the Old and New Testaments, but many more from the apocryphal books and traditions of the Jews and Christians of those ages, set up in the Koran as truths in opposition to the scriptures, which the Jews and Christians are charged with having altered: and indeed, few or none of the relations or circumstances in the Koran were invented by Mahomet, as is generally supposed, it being easy to trace the greatest part of them much higher, as the rest might be, were more of those books extant, and was it worth while to make the inquiry.

The rest of the Alcoran is taken up in prescribing

necessary laws and directions, frequent admonitions to moral and divine virtues, the worship and reverence of the Supreme Being, and resignation to his will. One of their most learned commentators distinguishes the contents of the Alcoran into *allegorical* and *literal*; under the former are comprehended all the obscure, parabolical, and enigmatical passages, with such as are repealed, or abrogated; the latter, such as are clear, and in full force.

The most excellent moral in the whole Alcoran, interpreters say, is that in the chapter *Al Akras*, viz. Show mercy, do good to all, and dispute not with the ignorant; or, as Mr Sale renders it, Use indulgence, command that which is just, and withdraw far from the ignorant. Mahomet, according to the authors of the *Keschaf*, having begged of the angel Gabriel a more ample explication of this passage, received it in the following terms: "Seek him who turns thee out, give to him who takes from thee, pardon him who injures thee; for God will have you plant in your souls the roots of his chief perfections." It is easy to see that this commentary is copied from the gospel.—In reality, the necessity of forgiving enemies, though frequently inculcated in the Alcoran, is of a later date among the Mahometans than among the Christians; and to be traced originally among the Jews. (See Exodus xxxiii. 4, 5.) But it matters not so much who had it first, as who observes it best. The caliph Haffan, son of Hali, being at table, a slave unfortunately let fall a dish of meat reeking hot, which scalded him severely. The slave fell on his knees, rehearsing these words of the Alcoran, "Paradise is for those who refrain their anger." I am not angry with thee, answered the caliph.—"And for those who forgive offences against them," continues the slave. I forgive thee thine, replies the caliph—"But above all, for those who return good for evil," adds the slave. I set thee at liberty, rejoined the caliph; and I give thee ten dinars.

There are also a great number of occasional passages in the Alcoran, relating only to particular emergencies. For this advantage Mahomet had in the piecemeal method of receiving his revelation, that whenever he happened to be perplexed and gravelled with any thing, he had a certain resource in some new morsel of revelation. It was an admirable contrivance of his, to bring down the whole Alcoran at once, only to the lowest heaven, not to earth; since, had the whole been published at once, innumerable objections would have been made, which it would have been impossible for him to solve: but as he received it by parcels, as God saw fit they should be published for the conversion and instruction of the people, he had a sure way to answer all emergencies, and to extricate himself with honour from any difficulty which might occur.

It is the general and orthodox belief among the Mahometans, that the Koran is of divine original; nay, that it is eternal and uncreated, remaining, as some express it, in the very essence of God: that the first transcript has been from everlasting by God's throne, written on a table of vast bigness, called the *preserved table*, in which are also recorded the divine decrees past and future: that a copy from this table, in one volume on paper, was by the ministry of the angel Gabriel sent down to the lowest heaven, in the month of Ramadan, on the night

Alcoran.

Alcoran.

of power: from whence Gabriel revealed it to Mahomet by parcels, some at Mecca, and some at Medina, at different times, during the space of 23 years, as the exigency of affairs required; giving him, however, the consolation to show him the whole (which they tell us was bound in silk, and adorned with gold and precious stones of paradise) once a-year; but in the last year of his life he had the favour to see it twice. They say, that few chapters were delivered entire, the most part being revealed piecemeal, and written down from time to time by the prophet's amanuensis in such a part of such and such a chapter, till they were completed, according to the directions of the angel. The first parcel that was revealed is generally agreed to have been the first five verses of the 96th chapter.

After the new-revealed passages had been from the prophet's mouth taken down in writing by his scribe, they were published to his followers; several of whom took copies for their private use, but the far greater number got them by heart. The originals, when returned, were put promiscuously into a chest, observing no order of time; for which reason it is uncertain when many passages were revealed.

When Mahomet died, he left his revelations in the same disorder, and not digested into the method, such as it is, in which we now find them. This was the work of his successor Abu Beer; who, considering that a great number of passages were committed to the memory of Mahomet's followers, many of whom were slain in their wars, ordered the whole to be collected, not only from the palm-leaves and skins on which they had been written, and which were kept between two boards or covers, but also from the mouths of such as had gotten them by heart. And this transcript, when completed, he committed to the custody of Hassa the daughter of Omar, one of the prophet's widows.

From this relation it is generally imagined that Abu Beer was really the compiler of the Koran; though, for aught appears to the contrary, Mahomet left the chapters complete as we now have them, excepting such passages as his successor might add or correct from those who had gotten them by heart; what Abu Beer did else, being perhaps no more than to range the chapters in their present order, which he seems to have done without any regard to time, having generally placed the longest first.

However, in the 30th year of the Hegira, Othman being then caliph, and observing the great disagreement in the copies of the Koran in the several provinces of the empire; those of Irak, for example, following the reading of Abu Mufa al Ashari, and the Syrians that of Macdad Ebn Afwad; he, by the advice of the companions, ordered a great number of copies to be transcribed from that of Abu Beer, in Hassa's care, under the inspection of Zeid Ebn Thabet, Abd'allah Ebn Zobair, Said Ebn al As, and Ad'alrahman Ebn al Hareth the Makhzumite; whom he directed, that, wherever they disagreed about any word, they should write it in the dialect of the Koreish, in which it was at first delivered. These copies, when made, were dispersed in the several provinces of the empire, and the old ones burnt and suppressed. Though many things in Hassa's copy were corrected by the abovementioned revisers, yet some few various readings still occur.

In fine, the book of the Alcoran is held in the highest

esteem and reverence among the Musselmans. They dare not so much as touch the Alcoran without being first washed, or legally purified; to prevent which, an inscription is put on the cover or label, *Let none touch but they who are clean.* It is read with great care and respect; being never held below the girdle. They swear by it; take omens from it on all weighty occasions; carry it with them to war; write sentences of it in their banners; adorn it with gold and precious stones; and knowingly suffer it not to be in the possession of any of a different religion. Some say that it is punishable even with death, in a Christian, to touch it; others, that the veneration of the Musselmans leads them to condemn the translating it into any other language as a profanation: but these seem to be aggravations. The Mahometans have taken care to have their scripture translated into the Persian, the Javan, the Malayan, and other languages; tho', out of respect to the original, these versions are generally, if not always, interlineated.

By the advocates of Mahometanism, the Koran, as already observed, has always been held forth as the greatest of miracles, and equally stupendous with the act of raising the dead. The miracles of Moses and Jesus, they say, were transient and temporary; but that of the Koran is permanent and perpetual; and therefore far surpasses all the miraculous events of preceding ages. We will not detract from the real merit of the Koran: we allow it to be generally elegant, and often sublime: but at the same time we reject with disdain its arrogant pretence to any thing supernatural; all the real excellence of the work being easily referable to natural and visible causes.

"In the language of Arabia, a language extremely loved and diligently cultivated by the people to whom it was vernacular, Mahomet found advantages which were never enjoyed by any former or succeeding impostor. It requires not the eye of a philosopher to discover in every soil and country a principle of national pride: and if we look back for many ages on the history of the Arabians, we shall easily perceive that pride among them invariably to have consisted in the knowledge and improvement of their native language. The Arabic, which has been justly esteemed the most copious of the Eastern tongues; which had existed from the remotest antiquity; which had been embellished by numberless poets, and refined by the constant exercise of the natives; was the most successful instrument which Mahomet employed in planting his new religion among them. Admirably adapted by its unrivalled harmony, and by its endless variety to add painting to expression, and to pursue the imagination in its unbounded flight; it became in the hands of Mahomet an irresistible charm to blind the judgment, and to captivate the fancy of his followers.

"Of that description of men, who first composed the adherents of Mahomet, and to whom the Koran was addressed, few, probably, were able to pass a very accurate judgment on the propriety of the sentiments, or on the beauties of the diction: but all could judge of the military abilities of their leader; and in the midst of their admiration it is not difficult to conceive, that they would ascribe to his compositions every imaginary beauty of inspired language.

"The shepherd and the soldier, though awake to the charms

Alcoran. charms of those wild but beautiful compositions, in which were celebrated their favourite occupations of love or war, were yet little able to criticise any other works than those which were addressed to their imagination or the heart. To abstract reasonings on the attributes and the dispensations of the Deity, to the comparative excellencies of rival religions, to the consistency of any one religious system in all its parts, and to the force of its various proofs, they were quite inattentive. In such a situation, the appearance of a work which possessed something like wisdom and consistence; which prescribed the rules, and illustrated the duties of life; and which contained the principles of a new and comparatively sublime theology; independently of its real and permanent merit, was likely to excite their astonishment, and to become the standard of future composition.

“In the first periods of the literature of every country, something of this kind has happened. The father of Grecian poetry very obviously influenced the taste and imitation of his countrymen. The modern nations of Europe all possess some original author, who, rising from the darkness of former ages, has begun the career of composition, and tinged with the character of his own imagination the stream which has flowed through his posterity.

“But the prophet of Arabia had in this respect advantages peculiar to himself. His compositions were not to his followers the works of man, but the genuine language of Heaven, which had sent him. They were not confined therefore to that admiration which is so liberally bestowed on the earliest productions of genius, or to that fond attachment with which men every where regard the original compositions of their country: but with their admiration they blended their piety. To know and to feel the beauties of the Koran, was in some respect to share in the temper of heaven; and he who was most affected with admiration in the perusal of its beauties, seemed most fitly the object of that mercy which had given it to ignorant man. The Koran, therefore, became naturally and necessarily the standard of taste. With a language thus hallowed in their imaginations, they were too well satisfied, either to dispute its elegance or improve its structure. In succeeding ages, the additional sanction of antiquity, or prescription, was given to these compositions which their fathers had admired: and while the belief of its divine original continues, that admiration, which has thus become the test and the duty of the faithful, can neither be altered nor diminished.

“When therefore we consider these peculiar advantages of the Koran, we have no reason to be surprised at the admiration in which it is held. But if, descending to a more minute investigation of it, we consider its perpetual inconsistency and absurdity, we shall indeed have cause for astonishment at that weakness of humanity which could ever have received such compositions as the work of the Deity.

“The first praise of all the productions of genius, is invention; that quality of the mind, which, by the extent and quickness of its views, is capable of the largest conceptions, and of forming new combinations of objects the most distant and unusual. But the Koran bears little impression of this transcendent character. Its materials are wholly borrowed from the Jewish and

Christian scriptures, from the Talmudical legends and apocryphal gospels then current in the East, and from the traditions and fables which abounded in Arabia. The materials collected from these several sources are here heaped together, with perpetual and needless repetitions, without any settled principle or visible connection.

“When a great part of the life of Mahomet had been spent in preparatory meditation on the system he was about to establish, its chapters were dealt out slowly and separately during the long period of 23 years. Yet thus defective in its structure, and not less exceptionable in its doctrines, was the work which Mahomet delivered to his followers as the oracles of God.

“The most prominent feature of the Koran, that point of excellence in which the partiality of its admirers have ever delighted to view it, is the sublime notion it generally impresses of the nature and attributes of God. If its author had really derived these just conceptions from the inspiration of that Being whom they attempt to describe, they would not have been surrounded, as they now are on every side, with error and absurdity. But it might easily be proved, that whatever it justly defines of the divine attributes, was borrowed from our holy scripture; which even from its first promulgation, but especially from the completion of the New Testament, has extended the views and enlightened the understandings of mankind; and thus furnished them with arms, which have too often been ineffectually turned against itself by its ungenerous enemies.

“In this instance particularly, the copy is far below the great original, both in the propriety of its images, and the force of its descriptions. Our holy scriptures are the only compositions that can enable the dim sight of mortality to penetrate into the invisible world, and to behold a glimpse of the Divine perfections. Accordingly, when they would represent to us the happiness of Heaven, they describe it, not by any thing minute and particular, but by something general and great; something, that without descending to any determinate object, may at once by its beauty and immensity excite our wishes and elevate our affections. Though in the prophetic and evangelical writings the joys that shall attend us in a future state are often mentioned with ardent admiration, they are expressed rather by allusion than similitude, rather by indefinite and figurative terms, than by any thing fixed and determinate. ‘Eye hath not seen, nor ear heard, neither have entered into the heart of man, the things which God hath prepared for them that love him.’ 1 Cor. ii. 9. What a reverence and astonishment does this passage excite in every hearer of taste and piety? What energy, and at the same time what simplicity, in the expression? How sublime, and at the same time how obscure, is the imagery?

“Different was the conduct of Mahomet in his descriptions of heaven and of paradise. Unassisted by the necessary influence of virtuous intentions and Divine inspiration, he was neither desirous, nor indeed able, to exalt the minds of men to sublime conceptions, or to rational expectations. By attempting to explain what is inconceivable, to describe what is ineffable, and to materialize what in itself is spiritual; he absurdly and impiously aimed to sensualize the purity of the Divine essence. Thus he fabricated a system of incoherence, a religion of depravity, totally repugnant indeed to the

nature

Alcoran,
Alcoranists

nature of that Being, who, as he pretended, was its object; but therefore more likely to accord with the appetites and conceptions of a corrupt and sensual age.

“That we may not appear to exalt our Scriptures thus far above the Koran by an unreasonable preference, we shall produce a part of the second chapter of the latter, which is deservedly admired by the Mahometans, who wear it engraved on their ornaments, and recite it in their prayers. ‘God! there is no God but he; the living, the self-subsisting: neither slumber nor sleep seizeth him: to him belongeth whatsoever is in heaven, and on earth. Who is he that can intercede with him but through his good pleasure? He knoweth that which is past, and that which is to come. His throne is extended over heaven and earth, and the preservation of both is to him no burden. He is the high, the mighty.’ *Sale’s Kor.* ii. p. 30. 4to edit.

“To this description who can refuse the praise of magnificence? Part of that magnificence, however, is to be referred to that verse of the Psalmist, whence it was borrowed, ‘He that keepeth Israel, shall neither slumber nor sleep.’ *Psal.* cxxi. 4.

“But if we compare it with that other passage of the same inspired Psalmist, all its boasted grandeur is at once obscured, and lost in the blaze of a greater light.

“O my God, take me not away in the midst of my days; thy years are throughout all generations. Of old hast thou laid the foundations of the earth; and the heavens are the work of thy hands. They shall perish, but thou shalt endure: yea all of them shall wax old, as doth a garment; as a vesture shalt thou change them, and they shall be changed; but thou art the same, and thy years shall not fail.”

“The Koran, therefore, upon a retrospective view of these several circumstances, far from supporting its arrogant claim to a supernatural work, sinks below the level of many compositions confessedly of human original; and still lower does it fall in our estimation, when compared with that pure and perfect pattern which we justly admire in the scriptures of truth.

“It is therefore abundantly apparent, that no miracle either was externally performed for the support, or is internally involved in the composition, of the Mahometan revelation.”

ALCORAN, is also figuratively applied to certain other books full of impieties and impostures.—In this sense we meet with the *Alcoran* of the Cordeliers, which has made a great noise; wherein St Francis is extravagantly magnified, and put on a level with Jesus Christ. The *Alcoran* of the Cordeliers is properly an extract of a very scarce book, intitled, The conformity of the life of the seraphic father St Francis with the life of Christ, published in 1504, 4to; since, at Bologna, in folio. Erasmus Albertus, being by the elector of Brandenburg appointed to visit a monastery of Franciscans, found this book; and being struck with the extreme folly and absurdity of it, collected a number of curiosities out of it, and published them under the title of the *Alcoran* of the Franciscans, with a preface by Martin Luther.

ALCORANISTS, among Mahometans, those who adhere strictly to the letter or text of the alcoran, from an opinion of its ultimate sufficiency and perfection.

The Persians are generally *Alcoranists*, as admitting the Alcoran alone for their rule of faith. The Turks, Tartars, Arabs, &c. besides the Alcoran, admit a multitude of traditions. The Alcoranists, among Mahometans, amount to much the same with the textuaries among the Jews. The Alcoranists can find nothing excellent out of the Alcoran; are enemies of philosophers, metaphysicians, and scholastic writers. With them the Alcoran is every thing.

ALCOVE, among builders, a recess, or part of a chamber separated by an estrade, or partition of columns, and other corresponding ornaments, in which is placed a bed of state, and sometimes seats to entertain company. These alcoves are frequent in Spain; and the bed is raised two or three ascents, with a rail at the foot.

ALCUINUS (Flaccus), an ecclesiastic of the eighth century. Where he was born, is a matter of dispute; but, according to the most probable opinion, it was in Yorkshire. It is pretty certain, however, that he was educated at York, under the direction of archbishop Egbert, as we learn from his own letters, in which he frequently calls that great prelate his beloved master, and the clergy of York the companions of his youthful studies. As he survived venerable Bede about 70 years, it is hardly possible that he could have received any part of his education under him, as some writers of literary history have affirmed; and it is worthy of observation, that he never calls that great man his master, though he speaks of him with the highest veneration. It is not well known to what preferment he had attained in the church before he left England, though some say he was abbot of Canterbury. The occasion of his leaving his native country, was his being sent on an embassy by Offa king of Mercia to the emperor Charlemagne; who contracted so great an esteem and friendship for him, that he earnestly solicited, and at length prevailed upon him, to settle in his court, and became his preceptor in the sciences. Alcuinus accordingly instructed that great prince in rhetoric, logic, mathematics, and divinity; which rendered him one of his greatest favourites. “He was treated with so much kindness and familiarity (says a cotemporary writer) by the Emperor, that the other courtiers called him, by way of eminence, *the emperor’s delight.*” Charlemagne employed his learned favourite to write several books against the heretical opinions of Felix Bishop of Urgel in Catalonia, and to defend the orthodox faith against that heresiarch, in the council of Francfort, A. D. 894; which he performed to the entire satisfaction of the Emperor and council, and even to the conviction of Felix and his followers, who abandoned their errors. The Emperor consulted chiefly with Alcuinus on all things relating to religion and learning; and, by his advice, did many great things for the advancement of both. An academy was established in the Imperial palace, over which Alcuinus presided, and in which the princes and prime nobility were educated; and other academies were established in the chief towns of Italy and France, at his instigation, and under his inspection. “France (says one of our best writers of literary history) is indebted to Alcuinus for all the polite learning it boasted of in that and the following ages. The universities of Paris, Tours, Fulden, Soissons, and many others, owe

Alcove,
Alcuinus.

Alcunus
||
Alcyonius.

owe to him their origin and increase; those of whom he was not the superior and founder, being at least enlightened by his doctrine and example, and enriched by the benefits he procured for them from Charlemagne." After Alcuinus had spent many years in the most intimate familiarity with the greatest prince of his age, he at length, with great difficulty, obtained leave to retire from court to his abbey of St Martin's at Tours. Here he kept up a constant correspondence by letters with Charlemagne; from which it appears, that both the emperor and his learned friend were animated with the most ardent love to learning and religion, and constantly employed in contriving and executing the noblest designs for their advancement. He composed many treatises on a great variety of subjects, in a style much superior in purity and elegance to that of the generality of writers in the age in which he flourished. Charlemagne often solicited him, with all the warmth of a most affectionate friend, to return to court, and favour him with his company and advice; but he still excused himself; and nothing could draw him from his retirement in his abbey of St Martin in Tours, where he died A. D. 804. His works were collected and published by Andrew du Chesne in one volume folio, Paris, 1617. They consist of, 1. Tracts upon scripture. 2. Tracts upon doctrine, discipline, and morality. 3. Historical treatises, letters, and poems. Since that edition, there has been published an incredible number of tracts, poems, &c. ascribed to this author, most of which, in all probability, were not his.

ALCYON, the trivial name of a species of alcedo. See **ALCEDO**.

ALCYONIUM, an obsolete name of a submarine plant. It is also used for a kind of coral, or astroites, frequently found fossil in England.

ALCYONIUM *Stagnum* (anc. geog.), a lake in the territory of Corinth, whose depth was unfathomable, and in vain attempted to be discovered by Nero. Thro' this lake Bacchus is said to have descended to hell, to bring back Semele; (Pausanias).

ALCYONIUS (Peter), a learned Italian, who flourished in the 16th century. He was well versed in the Greek and Latin tongues, and wrote some pieces of eloquence which met with great approbation. He was corrector of the press a considerable time for Aldus Manutius, and is intitled to a share in the praises given to the editions of that learned printer. He published a treatise concerning banishment, which contained so many fine passages intermixed with others quite the reverse, that it was thought he had tacked to somewhat of his own, several fragments of a treatise of *Cicero de gloria*; and that afterwards, in order to save himself from being detected in this theft, he burnt the manuscript of Cicero, the only one extant. Paulus Manutius, in his commentary upon these words of Cicero, *Librum tibi celeriter mittam de gloria*, "I will speedily send you my treatise on glory;" has the following passage relating to this affair: "He means (says he) his two books *On Glory*, which were handed down to the age of our fathers; for Bernard Justinian, in the index of his books, mentions *Cicero de Gloria*. This treatise, however, when Bernard had left his whole library to a nunnery, could not be found, though sought after with great care: nobody doubted but Peter Alcyonius, who, being physician to the nunnery,

was entrusted with the library, had basely stole it. And truly, in his treatise *Of Banishment*, some things are found interperfed here and there, which seem not to favour of Alcyonius, but of some higher author." The two orations he made after the taking of Rome, wherein he represented very strongly the injustice of Charles V. and the barbarity of his soldiers, were excellent pieces. There is also an oration ascribed to him, on the knights who died at the siege of Rhodes.

ALDBOROUGH, a sea-port town in Suffolk, with a market on Saturdays. It is pleasantly situated, in a dale, between a high hill to the westward, on which its large old-built church stands; the sea to the east, and its river running south-west. It is a large, long, ordinary town, made up of two or three streets of low houses, running parallel to each other. A quarter of a mile to the south lies Slaughden, where they have a commodious key, with warehouses for fish: more southerly still, they have conveniences for drying their north-sea fish. Their employment in the fishery is their chief business, which is considerable in the seasons for catching herrings and sprats; and it is the only place in England for curing red sprats. It is a town corporate, and sends two members to parliament. Towards the sea, it has some pieces of cannon planted for its defence. It is 88 miles north-east from London. E. Long. 1. 32. N. Lat. 52. 50.

ALDBOROUGH, a market-town in the west riding of Yorkshire, seated on the river Ouse, 15 miles north-west of York, and 200 miles north of London. It sends two members to parliament. W. Long. 0. 20. N. Lat. 54. 15. It was anciently a Roman city, called *Isurium Brigantium*; and several coins and monuments of the Saxons and Romans have been discovered there.

ALDEBARAN, in astronomy, a star of the first magnitude, called in English the *bull's eye*, as making the eye of the constellation Taurus. Its longitude is 6 deg. 32 min. 9 sec. of Gemini, and its latitude 5 deg. 29 min. 40 sec. south.

ALDER-TREE, in botany. See **BETULA**.

ALDERHOLM, a pleasant island of Sweden, formed by the three arms of a river running thro' Gentle, a town of Nordland, in Sweden. Here is a wharf, a repository for planks and deals, two packing houses, a large customhouse for taking toll of the ships, an arsenal for cannon, and a grenary.

ALDERMAN, in the British policy, a magistrate subordinate to the lord-mayor of a city or town-corporate. The number of these magistrates is not limited, but is more or less according to the magnitude of the place. In London they are 26; each having one of the wards of the city committed to his care. This office is for life; so that when one of them dies, or resigns, a ward-mote is called, who return two persons, one of whom the lord-mayor and aldermen choose to supply the vacancy. All the aldermen are justices of the peace, by a charter of 15 Geo. II. The aldermen of London, &c. are exempted from serving inferior offices; nor shall they be put upon assizes, or serve on juries, so long as they continue to be aldermen.

ALDERMAN, among our Saxon ancestors, was a degree of nobility answering to earl or count at present.

ALDERMAN was also used, in the time of king Edgar, for a judge or justice. Thus we meet with the

Aldbo-
rough
||
Alderman.

Alderney, Aldhelm. the titles of *Aldermannus totius Angliæ, aldermannus regis, comitatus, civitatis, burgi, castelli, hundredi five wapentachii, et novemdecimorum*. According to Spelman, the *aldermannus totius Angliæ* seems to have been the same officer who was afterwards styled *capitulis justiciarius Angliæ*, or chief-justice of England; the *aldermannus regis* seems to have been an occasional magistrate, answering to our justice of assize; and the *aldermannus comitatus*, a magistrate who held a middle rank between what was afterward called the *earl* and the *sheriff*; he sat at the trial of causes with the bishop: the latter proceeding according to ecclesiastical law, and the former declaring and expounding the common law of the land.

ALDERNEY, an island in the British channel, subject to the crown of Great Britain. It is about eight miles in compass, and is separated from Cape la Hogue, in Normandy, by a narrow strait, called the *Race of Alderney*, which is a very dangerous passage in stormy weather when the two currents meet; otherwise it is safe, and has depth of water for the largest ships. Thro' this strait the French fleet made their escape after their defeat at La Hogue, in 1692. It is a healthy island, has but one church, is fruitful both in corn and pasture, and is remarkable for a fine breed of cows. The inhabitants, for their greater safety, live together in a town of the same name. The number of houses are said to be 200, and the inhabitants 1000. It has but one harbour, called *Crabby*, which is at a good distance from the town; and is only fit for small vessels. To the west lie the range of rocks called the *Caskets*, so dangerous to mariners. W. Long. 2. 17. N. Lat. 49. 50.

ALDHELM (St), bishop of Shireburn in the time of the Saxon Heptarchy. He is said to have been the son of Kenred, brother to Ina, king of the West-Saxons; but, in the opinion of William of Malmesbury, his father was no more than a distant relation to the king. Having received the first part of his education in the school which one Macdulf, a learned Scot, had set up in the place where Malmesbury now stands, he travelled into France and Italy for his improvement. At his return home, he studied some time under Adrian abbot of St Augustine's in Canterbury, the most learned professor of the sciences who had ever been in England. In these different seminaries he acquired a very uncommon stock of knowledge; and became famous for his learning, not only in England, but in foreign countries: whence several learned men sent him their writings for his perusal and correction; particularly Prince Arcivil, a son of the king of Scotland, who wrote many pieces which he sent to Aldhelm, "intreating him to give them the last polish, by rubbing off their Scots rust." He was the first Englishman who wrote in the Latin language both in prose and verse, and composed a book for the instruction of his countrymen in the profody of that language. Besides this, he wrote several other treatises on various subjects; some of which are lost, and others published by Martin Delrio and Canisius. Venerable Bede, who flourished in the end of this and the beginning of the next century, gives the following character of Aldhelm: "He was a man of universal erudition, having an elegant style, and being wonderfully well acquainted with books, both on philosophical and religious subjects." In fact, considering the cloud of ignorance by which he was

surrounded, and the great difficulty of acquiring knowledge without proper instruction, Aldhelm was a very extraordinary man. From one of his letters to Hedda bishop of Winchester, concerning the nature of his studies whilst at Canterbury, he appears to have been indefatigably determined to acquire every species of learning in his power. For a copy of this curious epistle, see Henry's History, vol. ii. p. 320. King Alfred the Great declared, that Aldhelm was the best of all the Saxon poets; and that a favourite song, which was universally sung in his time, near 200 years after its author's death, was of his composition. When he was abbot of Malmesbury, having a fine voice, and great skill in music as well as poetry, and observing the backwardness of his barbarous countrymen to listen to grave instructions, he composed a number of little poems, which he sung to them after mass in the sweetest manner; by which they were gradually instructed and civilized. After this excellent person had governed the monastery of Malmesbury, of which he was the founder, about 30 years, he was made bishop of Sherburn, where he died A. D. 709.—He wrote, 1. *De octo vitiis principalibus*. This treatise is extant in *Bibliotheca Patrum* of Canisius. 2. *Ænigmaticum versuum mille*. This, with several other of his poems, was published by Martin Delrio at Mentz, 8vo, 1601. 3. A book addressed to a certain king of Northumberland, named Alfrid, on various subjects. 4. *De vita monachorum*. 5. *De laude sanctorum*. 6. *De arithmetica*. 7. *De astrologia*. 8. A book against the mistake of the Britons concerning the celebration of Easter; printed by Sonius, 1576. 9. *De laude virginitatis*. Manuscript, in Bennet-college, Cambridge. Published among Bede's *Opuscula*. Besides many sonnets, epistles, and homilies in the Saxon language.

ALDPORT, an ancient name for Manchester. See MANCHESTER.

ALDRED, abbot of Tavistock, was promoted to the bishopric of Worcester in the year 1046. He was so much in favour with King Edward the Confessor, and had so much power over his mind, that he obliged him to be reconciled with the worst of his enemies, particularly with Swane son of the earl Goodwin, who had revolted against him, and came with an army to invade the kingdom. Aldred also restored the union and friendship between king Edward and Griffin king of Wales. He took afterwards a journey to Rome, and being returned into England, in the year 1054, he was sent ambassador to the emperor Henry II.; he staid a whole year in Germany, and was very honourably entertained by Herman archbishop of Cologne, from whom he learned many things relating to ecclesiastical discipline, which on his return he established in his own diocess. In the year 1058 he went to Jerusalem, which no archbishop or bishop of England had ever done before him. Two years after he returned to England; and Kinsius archbishop of York dying the 22d of December 1060, Aldred was elected in his stead on Christmas day following, and thought fit to keep his bishoprick of Worcester with the archbishopric of Canterbury, as some of his predecessors had done. Aldred went soon after to Rome, in order to receive the Pallium from the Pope: He was attended by Toston earl of Northumberland, Gifo bishop of Wells, and Walter bishop of Hereford. The pope received Toston-

Aldhelm.
||
Aldred.

Aldred. ton very honourably, and made him sit by him in the synod which he held against the Simonists. He granted to Giso and Walter their request, because they were tolerably well learned, and not accused of simony. But Aldred being by his answers found ignorant, and guilty of simony, the pope deprived him very severely of all honours and dignities; so that he was obliged to return without the Pallium. On his way home he and his three fellow-travellers were attacked by some robbers, who took from them all that they had, though they did not offer to kill them. This obliged them to return to Rome; and the pope, either out of compassion, or by the threatenings of the earl of Northumberland, gave Aldred the Pallium; but he was obliged to resign his bishopric of Worcester. However, as the archbishopric of York had been almost entirely ruined by the many invasions of foreigners, king Edward gave the new archbishop leave to keep twelve villages or manors which belonged to the bishopric of Worcester. Edward the Confessor dying in 1066, Aldred crowned Harald his successor. He also crowned William the Conqueror, after he had made him take the following oath, viz. that he would protect the holy churches of God and their leaders; that he would establish and observe righteous laws; that he would entirely prohibit and suppress all rapines and unjust judgments. He was so much in favour with the Conqueror, that this prince looked upon him as a father; and, though imperious in regard to every body else, he yet submitted to obey this archbishop: John Bromton gives us an instance of the king's submission, which at the same time shows the prelate's haughtiness.—It happened one day, as the archbishop was at York, that the deputy-governor or lord-lieutenant going out of the city with a great number of people, met the archbishop's servants, who came to town with several carts and horses loaded with provisions. The governor asked them to whom they belonged; and they having answered they were Aldred's servants, the governor ordered that all these provisions should be carried to the king's store-house. The archbishop sent immediately some of his clergy to the governor, commanding him to deliver the provisions, and to make satisfaction to St Peter, and to him the saint's vicar, for the injury he had done them; adding, that if he refused to comply, the archbishop would make use of his apostolic authority against him, (intimating thereby that he would excommunicate him). The governor, offended at this proud message, used the persons whom the archbishop had sent him very ill, and returned an answer as haughty as the message was. Aldred thereupon went to London to make his complaint to the king; but in this very complaint he acted with his wonted insolence; for meeting the king in the church of St Peter at Westminster, he spoke to him in these words: "Hearken, O William: when thou wast but a foreigner, and God, to punish the sins of this nation, permitted thee to become master of it, after having shed a great deal of blood, I consecrated thee, and put the crown upon thy head with blessings; but now, because thou hast deserved it, I pronounce a curse over thee, instead of a blessing, since thou art become the persecutor of God's church, and of his ministers, and hast broken the promises and the oaths which thou

"madest to me before St Peter's altar." The king, terrified at this discourse, fell upon his knees, and humbly begged the prelate to tell him, by what crime he had deserved so severe a sentence. The noblemen, who were present, were enraged against the archbishop, and loudly cried out he deserved death, or at least banishment, for having offered such an injury to his sovereign, and they pressed him with threatenings to raise the king from the ground. But the prelate, unmoved at all this, answered calmly, "Good men, let him lie there, for he is not at Aldred's but at St Peter's feet; he must feel St Peter's power, since he dared to injure his vice-gerent." Having thus reproved the nobles by his episcopal authority, he vouchsafed to take the king by the hand, and to tell him the ground of his complaint. The king humbly excused himself, by saying he had been ignorant of the whole matter; and begged of the noblemen to intreat the prelate, that he might take off the curse he had pronounced, and to change it into a blessing. Aldred was at last prevailed upon to favour the king thus far; but not without the promise of several presents and favours, and only after the king had granted him to take such a revenge on the governor as he thought fit. Since that time (adds the historian) none of the noblemen ever dared to offer the least injury. It may be questioned, which was more surprising here, whether the archbishop's haughtiness, who dared to treat his sovereign after so unbecoming a manner; or the king's stupidity, who suffered such insolence and audaciousness from a priest?—The Danes having made an invasion in the north of England in the year 1068, under the conduct of Harold and Canute the sons of king Swane, Aldred was so much afflicted at it, that he died of grief the 11th of September in that same year, having besought God that he might not see the desolation of his church and country.

ALDRICH (Robert), bishop of Carlisle, was born at Burnham in Buckinghamshire about the year 1493, and educated at Eaton-school; from whence, in 1507, he was elected scholar of King's-college, Cambridge, where he took his degree in arts, and was afterwards proctor of the university. In 1525, he was appointed master of Eaton school, then became fellow of that college, and finally provost. In 1529, he went to Oxford, where, being first incorporated bachelor of divinity, in the following year he proceeded doctor in that faculty; in 1531, he was made arch-deacon of Colchester; in 1534, canon of Windsor; and the same year, registry of the order of the garter. He was consecrated bishop of Carlisle in the year 1537, and died at Horncastle in Lincolnshire in 1556. He wrote, 1. *Epistola ad Gul. Hormanum*, in Latin verse; printed in Horman's *Antibossican*, Lond. 1521, of which book Pitts erroneously makes Aldrich the author. 2. *Epigrammata varia*. 3. *Latin verses, and another epistle to Horman*, prefixed to the *Vulgaria puerorum* of that author, Lond. 1519, 4to. 4. *Answers to certain queries concerning the abuses of the mass; also about receiving the sacrament*.

ALDRICH (Dr Henry), an eminent English divine and philosopher, born at London in 1647, was educated at Westminster school under the famous Dr Busby, and admitted of Christ-church college, Oxford.

Aldrich. He had a great share in the controversy with the Papists in the reign of James II. and bishop Burnet ranks him among those who examined all the points of popery with a solidity of judgment, clearness of argument, depth of learning, and vivacity of writing, far beyond any who had before that time written in our language. He rendered himself so conspicuous, that at the revolution, when Massey the popish dean of Christ-church fled, his deanery was conferred on him. In this station he behaved in an exemplary manner, and that fabric owes much of its beauty to his ingenuity: it was Aldrich who designed the beautiful square called *Peck-water-Quadrangle*, which is esteemed an excellent piece of architecture. In imitation of his predecessor Dr Fell, he published, yearly, a piece of some ancient Greek author, as a present to the students of his house: he published *A System of Logic*, with some other pieces; and the revising Clarendon's History of the Rebellion was intrusted to him and bishop Spratt; but it doth not appear that they made any additions, or considerable alterations in it, as has been asserted by Mr Oldmixon. Besides his preferments above mentioned, Dr Aldrich was also rector of Wem in Shropshire. He was chosen prolocutor of the convocation in 1702. This worthy person died at Christ-church on the 14th of December 1710. As to his character, he was a most universal scholar, and had a taste for all sorts of learning, especially architecture. Sir John Hawkins has favoured the public with several particulars relative to Dr Aldrich's skill in music; and on account of the Doctor's eminence in this respect, Sir John hath given his life, with his head prefixed. His abilities as a musician rank him, we are told, among the greatest masters of the science. He composed many services for the church, which are well known; as are also his anthems, nearly to the number of twenty. He adapted, with great skill and judgment, English words to many of the notes of Palestrina, Carissimi, Victoria, and other Italian composers for the church, some of which are frequently sung in our cathedrals as anthems. By the happy talent which Dr Aldrich possessed, of naturalizing the compositions of the old Italian masters, and accommodating them to an English ear, he increased the stores of our own church. Though the Doctor chiefly applied himself to the cultivation of sacred music, yet, being a man of humour, he could divert himself by producing pieces of a lighter kind. There are two catches of his; the one, "Hark the bonny Christ-church Bells," the other intitled, "a Smoking Catch," to be sung by four men smoking their pipes, which is not more difficult to sing than diverting to hear. His love of smoking was, it seems, so excessive as to be an entertaining topic of discourse in the university. Such was Dr Aldrich's regard for the advancement of music, and the honour of its professors, that he had formed a design of writing a history of the science; and the materials from which he proposed to compile it are yet extant in the library of his own college. It appears from these materials, that he had marked down every thing which he had met with concerning music and musicians; but that he had wrought no part of them into any kind of form.

Dr Aldrich is of some note as a Latin poet. In the *Musa Anglicana*, we find two elegant copies of verses by him; one on the accession of King William III.

VOL. I. Part I.

and the other on the death of the Duke of Gloucester. Sir John Hawkins hath preserved a humorous translation by him of the well-known English ballad,

Aldrich,
Aldrovandus.

"A soldier and a sailor,
"A tinker and a taylor," &c.

The following epigram, intitled "Causa Bibendi," is likewise ascribed to Dr Aldrich:

"Si bene quid memini, Causæ sunt quinque bibendi,
"Hospitis Adventus; præsens Sitis, atque futura;
"Aut Vini Bonitas; aut quæ libet altera Causa."

The epigram has been thus translated:

"If on my theme I rightly think,
"There are five reasons why men drink:
"Good wine, a friend, because I'm dry,
"Or lest I should be by and by,
"Or any other reason why."

The translation is not equal to the original. It is evident, from the verses cited and referred to, that Dr Aldrich was of a very cheerful and pleasant turn of mind. Indeed, he is always spoken of as having been a man of wit; and as one who, to his great talents and virtues, joined those amiable qualities, which rendered him the object of general affection, as well as of general esteem and respect. Having never been married, he appropriated his income to works of hospitality and beneficence, and in encouraging learning to the utmost of his power, of which he was a most munificent patron, as well as one of the greatest men in England, if considered as a Christian or a gentleman. He had always the interest of his college at heart, whereof he was an excellent governor. And, as he was remarkable for modesty and humility, concealing his name to those several learned tracts he published, so at his death he appointed to be buried without any memorial in the cathedral; which his thrifty nephew complied with, depositing him on the south side of bishop Fell's grave, December 22, eight days after his decease; which happened in the 63d or 64th year of his age.

ALDROVANDUS (Ulysses), professor of philosophy and physic at Bologna, the place of his nativity. He was a most curious inquirer into natural history, and travelled into the most distant countries on purpose to inform himself of their natural productions. Minerals, metals, plants, and animals, were the objects of his curious researches; but he applied himself chiefly to birds, and was at great expence to have figures of them drawn from the life. Aubert le Mire says, that he gave a certain painter, famous in that art, a yearly salary of 200 crowns, for 30 years and upwards; and that he employed at his own expence Lorenzo Bennini and Cornelius Swintus, as well as the famous engraver Christopher Coriolanus. These expences ruined his fortune, and at length reduced him to the utmost necessity; and it is said that he died blind in an hospital at Bologna, at a great age, in 1605. Mr Bayle observes, that antiquity does not furnish us with an instance of a design so extensive and so laborious as that of Aldrovandus, with regard to natural history; that Pliny has treated of more kinds of subjects, but only touches lightly on them, saying but a little upon any thing, whereas Aldrovandus has collected all he could meet with. His compilation, or that compiled upon

Aldrovandus his plan, consists of 13 volumes in folio, several of which were printed after his death. He himself published his Ornithology, or History of Birds, in three folio volumes, in 1599; and his seven books Of Insects, which make another volume of the same size. The volume Of Serpents, three Of Quadrupeds, one Of Fishes, that Of exanguious Animals, the History of Monsters, with the Supplement to that of Animals, the treatise Of Metals, and the Dendrology or History of Trees, were published at several times after the death of Aldrovandus, by the care of different persons; and Aldrovandus is the sole author only of the first six volumes of this work, the rest having been finished and compiled by others, upon the plan of Aldrovandus: a most extensive plan, wherein he not only relates what he has read in naturalists, but remarks also what historians have written, legislators ordained, and poets feigned: he explains also the different uses which may be made of the things he treats of, in common life, in medicine, architecture, and other arts; in short, he speaks of morality, proverbs, devices, riddles, hieroglyphics, and many other things which relate to his subject.

ALDROVANDA, in botany, a genus of the pentandria order, belonging to the pentagynia class of plants; of which there is but one species. The calyx is divided into five parts; the petals are five; and the capsule has five valves, with ten seeds. It is a native of Italy and the Indies; and has no English name.

ALDUABIS (anc. geog.), a river of Celtic Gaul, which rising from Mount Jura, separating the Sequani from the Helvetii, and running through the county of Burgundy, or the Franche Comté, environs almost on every side the city of Besançon; and running by Dole, falls into the Saone near Chalons. In Cæsar it is called *Alduadubis*; in Ptolemy, *Dubis*: now *le Doux*.

ALE, a fermented liquor obtained from an infusion of malt, and differing from beer chiefly in having a less proportion of hops. (See BREWING.). This liquor, the natural substitute of wine in such countries as could not produce the grape, was originally made in Egypt, the first planted kingdom, on the dispersion from the east, that was supposed unable to produce grapes. And, as the Noachian colonies pierced further into the west, they found, or thought they found, the same defect, and supplied it in the same manner. Thus the natives of Spain, the inhabitants of France, and the aborigines of Britain, all used an infusion of barley for their ordinary liquor: and it was called by the various names of *Calia* and *Ceria* in the first country, *Cerevisia* in the second, and *Curmi* in the last; all literally importing only *the strong water*.

“All the several nations (says Pliny) who inhabit the west of Europe, have a liquor with which they intoxicate themselves, made of corn and water. The manner of making this liquor is somewhat different in Gaul, Spain, and other countries, and is called by many various names; but its nature and properties are every where the same. The people of Spain, in particular, brew this liquor so well, that it will keep good a long time. So exquisite is the cunning of mankind, in gratifying their vicious appetites, that they have thus invented a method to make water itself intoxicate.” The method in which the ancient Britons, and other Celtic nations, made their ale, is thus described by Isidorus and Orosius. “The grain is steeped in

water and made to germinate, by which its spirits are excited and set at liberty; it is then dried and ground; after which it is infused in a certain quantity of water; which being fermented, becomes a pleasant, warming, strengthening, and intoxicating liquor.” This ale was most commonly made of barley; but sometimes of wheat, oats, and millet.

Anciently the Welch and Scots had also two kinds of ale, called *common ale* and *spiced ale*; and their value was thus ascertained by law: “If a farmer hath no mead, he shall pay two casks of spiced ale, or four casks of common ale, for one cask of mead.” By this law, a cask of spiced ale, nine palms in height, and 18 palms in diameter, was valued at a sum of money equal in efficacy to L. 7: 10s. of our present money; and a cask of common ale, of the same dimensions, at a sum equal to L. 3: 15s. This is a sufficient proof, that even common ale in this period was an article of luxury among the Welch, which could only be obtained by the great and opulent. Wine seems to have been quite unknown even to the kings of Wales in this period, as it is not so much as once mentioned in their laws; though Giraldus Cambrensis, who flourished about a century after the conquest, acquaints us, that there was a vineyard in his time at Maenarper, near Pembroke, in South Wales.

Ale was the favourite liquor of the Anglo-Saxons and Danes, as it had been of their ancestors the ancient Germans. Before their conversion to Christianity, they believed that drinking large and frequent draughts of ale was one of the chief felicities which those heroes enjoyed who were admitted into the hall of Odin.

There are various sorts of ale known in Britain, particularly *pale* and *brown*: the former is brewed from malt slightly dried; and is esteemed more viscid than the latter, which is made from malt more highly dried or roasted.

Pale ale brewed with hard waters, as those of springs and wells, is judged the most wholesome, in regard the mineral particles tend to prevent the cohesion of those drawn from the grain, and enable them to pass the proper secretions the better; softer waters, as those of rivers, and rain, seem better suited to draw out the substance of high-dried malts, which retain many igneous particles, best absorbed in a smooth vehicle.

In Staffordshire, they have a secret of fining ale in a very short time. Plot conjectures it to be done by adding alum, or vinegar, in the working.

Ale is prepared various ways, and of various ingredients, as of wheat, rye, millet, oats, barley, the berries of the quick-bean, &c.

Some have found that the juice which bleeds from the birch or fycamore is of great use on this occasion, applied instead of water. It makes one bushel of malt go as far as four in the common way.

Some have a method of preparing ale, so that it will keep, carried to the East or West Indies. The secret is, by mashing twice with fresh malt; boiling twice; and, after shipping it, putting to every five gallons two new-laid eggs whole, to remain therein. It is said, that, in a fortnight's time, the shells will be dissolved; and the eggs become like wind-eggs; and that afterwards the white would disappear and the yoke remain untouched.

Ale. Ale is generally held to be more diuretic than beer, in regard it is smoother, more softening, and relaxing; so that where urine is to be promoted by facilitating the passage, ale is most likely to effect it.

Ale is flatulent; and hence sometimes produces colics, and the cholera morbus: it is acefcent; but it does not produce calcareous diseases, as has been asserted.

If malt-liquor, of any degree of strength, is become flat and tartish, as it is used, it should be drawn out of the cask into a jug, in which as many drams of powdered chalk is put as there are to be pints of liquor; thus a new ferment will be raised, a sprightly taste will be restored to the liquor, and its acidity will be destroyed. Tart liquors of this kind are apt to produce a dysury, strangury, or a gonorrhœa; in which cases, a small quantity of brandy may be taken.

The consumption of ale in these kingdoms is incredible. It was computed twenty years ago at the value of four millions yearly, including Great Britain and Ireland.

The duties on ale and beer make a principal branch of the revenue in Britain. They were first imposed by the 12th of Car. II. and have been continued by several subsequent acts of parliament to first Geo. III. which lays an additional duty of 3d. per barrel. In the whole, the brewer of ale and beer for sale shall pay 8s. for every barrel of either, above 6s. a barrel; and for every barrel of 6s. or under, the sum of 1s. 4d.

Medicated ALES, those wherein medicinal herbs have been infused, or added during the fermentation. See PHARMACY, (Index).

Gill ALE, is that in which the dried leaves of gill or ground-ivy have been infused. It is esteemed absterfivè and vulnerary, and consequently good in disorders of the breast and obstructions of the viscera.

ALE-Conner, an officer in London, who inspects the measures used in public-houses. There are four ale-conners, who are all chosen by the common council of the city.

ALE-Houses must be licensed by justices of the peace, who take recognizances of the persons licensed, and of their sureties, viz. 10 l. each, that they will not suffer unlawful gaming, nor other disorderly practices in their houses. Every person, excepting those who sell ale in fairs, neglecting to procure a licence, is liable to a penalty of 40 s. for the first offence, 4 l. for the second, and 6 l. for the third, with all costs. The licence is granted on the first of September, or within twenty days after, at a general meeting of the justices for the division to which he belongs, upon his producing a certificate to his character, unless, by living in a city or town-corporate, this last circumstance is dispensed with, and continues in force for one year only. Ale-house keepers, selling ale in short measure, are liable to a penalty not exceeding 40s. and not less than 10s. and likewise to a fine of 10s. for permitting tipling, &c.

By 29th Geo. II. c. 12. persons keeping ale-houses in Scotland shall be licensed as in England, and the justices there shall meet annually to license ale-houses; on each of which licenses a fee of 1 s. is payable to the clerk of the peace. Magistrates of royal boroughs shall meet yearly for the like purpose; but where there shall not be a sufficient number of magistrates to act in any royal borough, justices may grant licenses, to be in force for one year only. Ibid.

Persons in Scotland convicted of keeping unlicensed ale-houses shall forfeit for the first offence 5s. for the second 10 s. for the third 20 s. and to be disqualified; and for every subsequent offence 40 s. to be levied by distress and sale, one moiety to the informer, the other to the poor of the parish. Conviction to be intimated to the offender, and certified to the clerk of the peace, and recorded: but persons aggrieved may appeal to the quarter sessions. Ibid.

Licenses for houses on the military roads in Scotland shall be issued on payment of 1 s. only to the clerk of the peace: making out licenses before the same be stamped, is a penalty of 10 l. and making them contrary to the intention of this act, 5 l. and the same shall be vacated, unless the duty and fine be paid, and the receipt produced, and license stamped. Ibid.

ALE-Silver, a tax paid annually to the lord-mayor of London, by all who sell ale within the city.

ALEA, in Roman antiquity, denotes in general all manner of games of chance; but, in a more restricted sense, was used for a particular game played with dice and tables, not unlike our backgammon.

ALEANDER (Jerome), cardinal and archbishop of Brindisi, was born in 1480; and distinguished himself at the beginning of the reformation, by the opposition he made to Luther: for being sent into Germany as the pope's nuncio in 1519, he acted, as occasion served, in the character both of ambassador and doctor; and declaimed three hours together against Luther's doctrine before the diet of Worms, but could not prevent that celebrated reformer from being heard in that diet. He published several works, and died at Rome in 1542.

ALEANDER (Jerome), a learned man of the seventeenth century, born in the principality of Friuli, of the same family with the preceding. When he went to Rome, he was employed as secretary under cardinal Octavius Bandini, and discharged this office with great honour for almost twenty years. He afterwards, by the persuasion of Urban VIII. who had a great esteem for him, became secretary to Cardinal Barberini, whom he accompanied to Rome when he went there in the character of legate à latere, and in whose service he died in 1631. He was one of the first members of the academy of Humorists, wrote a learned treatise in Italian on the device of the society, and displayed his genius on many different subjects. Barberini gave him a magnificent funeral at the academy of Humorists; the academists carried his corpse to the grave; and Gaspar Simeonibus, one of the members, made his funeral oration.

ALECTO, one of the FURIES, daughter of Acheron and Night, or, as others would have it, of Pluto and Proserpine.

ALECTORIA, a stone said to be formed in the gall-bladders of old cocks, to which the ancients ascribed many fabulous virtues. This is otherwise called *Alectorius Lapis*, sometimes *Alectorolithos*, in English the *cock-stone*. The more modern naturalists hold the *alectorius lapis* to be originally swallowed down, not generated in, the stomach or gizzard of cocks and capons. It is known that many of the fowl-kind make a practice of swallowing pebbles, as it is supposed to be of service in the business of trituration and digestion.

ALECTOROMANTIA, in antiquity, a species of divination performed by means of a cock. This is

Ale

Alectoro-
mantia.

A-lee
||
Alembert.

otherwise called *Alestryomancy*; of which there appear to have been different species. But that most spoken of by authors was in the following manner: A circle being described on the ground, and divided into twenty-four equal portions, in each of these spaces was written one of the letters of the alphabet, and on each of the letters was laid a grain of wheat; after which, a cock being turned loose in the circle, particular notice was taken of the grains picked up by the cock, because the letters under them, being formed into a word, made the answer desired. It was thus, according to Zonaras, that Libanius and Jamblicus fought who should succeed the emperor Valens; and the cock eating the grains answering to the spaces ΘΕΟΔ, several whose names began with those letters, as Theodotus, Theodistes, Theodulus, &c. were put to death; which did not hinder, but promote, Theodosius to the succession. But the story, however current, is but ill supported: It has been called in question by some, and refuted by others, from the silence of Marcellinus, Socrates, and other historians of that time.

A-LEE, in the sea-language, a term only used when the wind, crossing or flanking the line of a ship's course, presses upon the masts and sails so as to make her incline to one side, which is called the lee-side: hence, when the helm is moved over to this side, it is said to be *a-lee*, or *hard-a-lee*.

ALEGAMBE (Philip), a celebrated Jesuit, born at Brussels in 1592, distinguished himself by publishing a *Bibliothèque* of the writers of his order, and died at Rome in 1652.

ALEGRETTE, a small town of Portugal, in Alentejo, on the confines of Port Alegre, on the river Caja, which falls into the Guadiana, a little below Bajadoz, near the frontiers of Spanish Estremadura. It is a very pretty town, and finely situated; seven miles south-east of Port Alegre, and thirty north of Elvas. W. Long. 5. 20. N. Lat. 39. 6.

ALEIUS CAMPUS (anc. geog.), a plain in Cilicia, on this side the river Pyramus, near the mountain Chimera, famous for Bellerophon's wandering and perishing there, after being thrown off Pegasus; which is the reason of the appellation.

ALEMANIA, or ALLEMANIA, (anc. geog.) a name of Germany, but not known before the time of the Antonines, and then used only for a part. After the Marcomanni and their allies had removed from the Rhine, a rabble, or collection of people from all parts of Gaul; as the term *Alemanni* denotes, prompted either by levity or poverty, occupied the Agri, called *Decumates* by Tacitus, because they held them on a title; now supposed to be the duchy of *Wurtemberg*. Such appear to be the small beginnings of *Alemania*, which was in after-times greatly enlarged: but still it was considered as a distinct part; for Caracalla, who conquered the *Alemanni*, assumed the surname both of *Alemannicus* and *Germanicus*.

ALEMBDAR, an officer in the court of the Grand Signior, who bears the green standard of Mahomet, when the sultan appears in public on any solemn occasion.

ALEMBERT (John le Rond d'), an eminent French philosopher, was born at Paris in 1717. He derived the name of John le Rond from that of the church near which, after his birth, he was exposed as

a foundling. His father, informed of this circumstance, listened to the voice of nature and duty, took measures for the proper education of his child, and for his future subsistence in a state of ease and independence.

He received his first education in the College of the Four Nations, among the Jansenists, where he gave early marks of capacity and genius. In the first year of his philosophical studies, he composed a Commentary on the Epistle of St Paul to the Romans. The Jansenists considered this production as an omen that portended to the party of Port-Royal a restoration to some part of their ancient splendor, and hoped to find one day in M. d'Alembert a second Pascal. To render this resemblance more complete, they engaged their rising pupil in the study of the mathematics; but they soon perceived that his growing attachment to this science was likely to disappoint the hopes they had formed with respect to his future destination: they, therefore, endeavoured to divert him from this line; but their endeavours were fruitless.

At his leaving college, he found himself alone and unconnected in the world; and sought an asylum in the house of his nurse. He comforted himself with the hope, that his fortune, though not ample, would better the condition and subsistence of that family, which was the only one that he could consider as his own: Here, therefore, he took up his residence, resolving to apply himself entirely to the study of geometry: And here he lived, during the space of forty years, with the greatest simplicity, discovering the augmentation of his means only by increasing displays of his beneficence, concealing his growing reputation and celebrity from these honest people, and making their plain and uncouth manners the subject of good-natured pleasantry and philosophical observation. His good nurse perceived his ardent activity; heard him mentioned as the writer of many books; but never took it into her head that he was a great man, and rather beheld him with a kind of compassion. "You will never," said she to him one day, "be any thing but a philosopher—and what is a philosopher?—a fool, who toils and plagues himself during his life, that people may talk of him when he is no more."

As M. d'Alembert's fortune did not far exceed the demands of necessity, his friends advised him to think of a profession that might enable him to augment it. He accordingly turned his views to the law, and took his degrees in that line; but soon abandoned this plan, and applied to the study of medicine. Geometry, however, was always drawing him back to his former pursuits, and after many ineffectual efforts to resist its attractions, he renounced all views of a lucrative profession, and gave himself over entirely to mathematics and poverty.

In the year 1741 he was admitted member of the Academy of Sciences; for which distinguished literary promotion, at such an early age, he had prepared the way by correcting the errors of a celebrated work, which was deemed classical in France in the line of geometry. He afterwards set himself to examine, with deep attention and assiduity, what must be the motion of a body which passes from one fluid into another more dense, in a direction not perpendicular to the surface separating the two fluids. Every one knows the phenomenon which happens in this case, and which amusez.

Alembert.

The Ana-
lyse demon-
strée of F.
Bernoulli.

Alembert. amuses children under the denomination of *Ducks and Drakes*; but M. d'Alembert was the first who explained it in a satisfactory and philosophical manner.

Two years after his election to a place in the academy, he published his *Treatise on Dynamics*. The new principle developed in this treatise consisted in establishing equality, at each instant, between the changes that the motion of a body has undergone, and the forces or powers which have been employed to produce them; or to express the thing otherwise, in separating into *two parts* the action of the moving powers, and considering the *one* as producing alone the motion of the body, in the second instant, and the *other* as employed to destroy that which it had in the first.

So early as the year 1744, M. d'Alembert had applied this principle to the theory of the equilibrium, and the motion of fluids; and all the problems before solved by geometricians became, in some measure, its corollaries. The discovery of this new principle was followed by that of a new calculus, the first trials of which were published in a *Discourse on the general Theory of the Winds*, to which the prize-medal was adjudged by the academy of Berlin in the year 1746, and which was a new and brilliant addition to the fame of M. d'Alembert. This new calculus of partial differences he applied, the year following, to the problem of vibrating chords, whose solution, as well as the theory of the oscillations of the air and the propagation of sound, had been given but incompletely by the geometricians who preceded him, and these were his masters or his rivals.

In the year 1749 he furnished a method of applying his principle to the motion of any body of a given figure; and he solved the problem of the precession of the equinoxes, determined its *quantity*, and explained the phenomenon of the nutation of the terrestrial axis discovered by Dr Bradley.

In 1752, M. d'Alembert published a treatise on the *Resistance of Fluids*, to which he gave the modest title of an *Essay*; but which contains a multitude of original ideas and new observations. About the same time he published, in the *Memoirs of the Academy of Berlin*, *Researches concerning the Integral Calculus*, which is greatly indebted to him for the rapid progress it has made in the present century.

While the studies of M. d'Alembert were confined to geometry, he was little known or celebrated in his native country. His connections were limited to a small society of select friends: he had never seen any man in high office except Messrs d'Argenson. Satisfied with an income which furnished him with the necessaries of life, he did not aspire after opulence or honours, nor had they been hitherto bestowed upon him, as it is easier to confer them on those who solicit them, than to look out for men who deserve them. His cheerful conversation, his smart and lively sallies, a happy knack at telling a story, a singular mixture of malice of speech with goodness of heart, and of delicacy of wit with simplicity of manners, rendered him a pleasing and interesting companion, and his company consequently was much sought after in the fashionable circles. His reputation, at length, made its way to the throne, and rendered him the object of royal attention and beneficence. He received also a pension from go-

vernment, which he owed to the friendship of Count Alembert. d'Argenson.

The tranquillity of M. d'Alembert was abated when his fame grew more extensive, and when it was known beyond the circle of his friends, that a fine and enlightened taste for literature and philosophy accompanied his mathematical genius. Our author's eulogist ascribes to envy, detraction, and to other motives nearly as ungenerous, all the disapprobation, opposition, and censure that M. d'Alembert met with on account of the publication of the famous *Encyclopedical Dictionary of Arts and Sciences*, in conjunction with Diderot. None surely will refuse the well-deserved tribute of applause to the eminent displays of genius, judgment, and true literary taste, with which M. d'Alembert has enriched the great work now mentioned. Among others, the Preliminary Discourse he has affixed to it, concerning the rise, progress, connections, and affinities of all the branches of human knowledge, is perhaps one of the most capital productions of which the philosophy of the present age can boast. Nor will it be disputed, that the master-builders of this new and stupendous temple of science, for the worship of NATURE, had also really in view the advancement of human knowledge, and the improvement of the arts and sciences. This, no true, no candid philosopher, will call in question. But that in the *inner court* of this temple there was a confederacy formed against all those who looked higher than nature, for the principal object of their veneration and confidence, is a fact too palpable, nay too boldly avowed, to stand in need of any proof.

Some time after this, d'Alembert published his *Philosophical, Historical, and Philological Miscellanies*. These were followed by the *Memoirs of Christina Queen of Sweden*; in which M. d'Alembert showed that he was acquainted with the natural rights of mankind, and was bold enough to assert them. His *Essay on the Intercourse of Men of Letters with Persons high in Rank and Office*, wounded the former to the quick, as it exposed to the eyes of the public the ignominy of those servile chains, which they feared to shake off, or were proud to wear. A lady of the court hearing one day the author accused of having exaggerated the despotism of the great, and the submission they require, answered slyly, *If he had consulted me, I would have told him still more of the matter.*

M. d'Alembert gave very elegant specimens of his literary abilities in his translations of some select pieces of Tacitus. But these occupations did not divert him from his mathematical studies: for about the same time he enriched the *Encyclopédie* with a multitude of excellent articles in that line, and composed his *Researches on several important Points of the System of the World*, in which he carried to a higher degree of perfection the solution of the problem of the perturbations of the planets, that had several years before been presented to the Academy.

In 1759 he published his *Elements of Philosophy*: a work extolled as remarkable for its precision and perspicuity; in which, however, are some tenets relative both to metaphysics and moral science, that are far from being admissible.

The resentment that was kindled (and the disputes that followed it) by the article *Geneva*, inserted in the *Encyclopédie*,

Monthly
Review for
Mar. 1787.

Alembert ||
Alembroth ||
Encyclopédie, are well known. M. d'Alembert did not leave this field of controversy with flying colours. Voltaire was an auxiliary in the contest: but as, in point of candour and decency, he had no reputation to lose; and as he weakened the blows of his enemies, by throwing both them and the spectators into fits of laughter, the issue of the war gave him little uneasiness. It fell more heavily on d'Alembert; and exposed him, even at home, to much contradiction and opposition.

It was on this occasion that the late king of Prussia offered him an honourable asylum at his court, and the place of president of his academy; and was not offended at his refusal of these distinctions, but cultivated an intimate friendship with him during the rest of his life. He had refused, some time before this, a proposal made by the empress of Russia to intrust him with the education of the Grand Duke;— a proposal accompanied with all the flattering offers that could tempt a man, ambitious of titles, or desirous of making an ample fortune: but the objects of his ambition were tranquillity and study.

In the year 1765, he published his *Dissertation on the Destruction of the Jesuits*. This piece drew upon him a swarm of adversaries, who confirmed the merit and credit of his work by their manner of attacking it.

Beside the works already mentioned, he published nine volumes of memoirs and treatises, under the title of *Opuscules*; in which he has solved a multitude of problems relative to astronomy, mathematics, and natural philosophy; of which our panegyrist gives a particular account, more especially of those which exhibit new subjects, or new methods of investigation.

He published also *Elements of Music*; and rendered, at length, the system of Rameau intelligible; but he did not think the mathematical theory of the sonorous body sufficient to account for the rules of that art. He was always fond of music; which, on the one hand, is connected with the most subtle and learned researches of rational mechanics; while, on the other, its power over the senses and the soul exhibits to philosophers phenomena no less singular, and still more inexplicable.

In the year 1772 he was chosen secretary to the French academy. He formed, soon after this preferment, the design of writing the lives of all the deceased academicians, from 1700 to 1772; and in the space of three years he executed this design, by composing 70 eulogies.

M. d'Alembert died on the 29th of October 1783. There were many amiable lines of candour, modesty, disinterestedness, and beneficence, in his moral character; which are described, with a diffusive detail, in his eulogium, by M. Condorcet, *Hist. de l'Acad. Royale des Sciences*, 1783.

ALEMBIC, a chemical vessel, usually made of glass or copper, formerly used for distillation. The bottom part, which contained the subject for distillation, is called, from its shape, the *cucurbit*; the upper part, which receives and condenses the steam, is called the *head*, the beak of which is fitted into the neck of a receiver. Retorts, and the common *worm-still*, are now more generally employed.

ALEMBROTH, in the writings of the alchemists,

A word used for a sort of fixed alkaline salt, which had the power of the famous alkalest, in dissolving bodies, opening the pores of most or all known substances, and thence, as well as by destroying sulphurs, promoting the separation of metals from their ores.—It is also used for a compound of corrosive mercury and sal ammoniac. See CHEMISTRY.

ALENIO (Julius), a Jesuit, born at Brescia in the republic of Venice. He travelled into the eastern countries; and arrived at Maca in 1610, where he taught mathematics. From thence he went to the empire of China, where he continued to propagate the Christian religion for thirty-six years. He was the first who planted the faith in the province of Xansi, and he built several churches in the province of Fokien. He died in August 1649, leaving behind him several works in the Chinese language.

ALENTEJO, a province of Portugal, between the rivers of Tajo and Guadiana: the soil is very fertile, and the inhabitants laborious and industrious. The principal town is Eborá.

ALENZON, a large handsome town of France, in lower Normandy, with the title of a duchy. It is surrounded with good walls, and flanked with towers. The castle was formerly a place of great consequence, and has held out long sieges. It has but one parish-church, which has a bold and noble front. Among the nunneries, that of St Clair is most remarkable. It is seated on the river Sarthe, in a vast open plain, which produces all sorts of corn and fruit. Near it there are quarries of stone fit for building, wherein are found a sort like Bristol stones. The linen made at Alenzon is very good, and sells at Paris. It is 20 miles north of Mans, 63 south-by-west of Rouen, and 88 south-west of Paris. Lon. o. 10. N. lat. 48. 25.

ALEPPO, or HALAB, the capital of the Pachalic, and of all Syria, and the ordinary residence of the pacha, is situated in the vast plain which extends from the Orontes to the Euphrates, and which towards the south terminates in the desert. It is built on eight hills or eminences, on the highest of which the castle is erected, and is supposed to be the ancient Beræa. This mount is of a conic form, and seems in a great measure to be raised with the earth thrown up out of a deep broad ditch which surrounds it. The suburbs to the north-north-east are next in height to this, and those to the west-south-west are much lower than the parts adjacent, and than any other part of the city. The houses are large and commodious, having terraces on their tops, and generally sky-lights in form of a dome to let the light into the rooms, which from their loftiness, the gilding on the window-shutters, cupboard-doors, &c. have at first entrance a very grand and agreeable effect. They are all so equal in height, that there are seldom any steps to ascend or descend in going from one house to another; while several large vaulted streets increase the facility of communication, by affording a passage to every part of the city free from the embarrassment of the open streets. They are carefully paved; have gutters and a foot-pavement on each side; and the middle of the street is laid with brick, the small end upwards, for the convenience of the horses. There is also a cleanliness observed here unknown to the other cities of Turkey, and which is not attended with the trouble of our scavengers, there being

Aleppo. being ass-drivers who go about the city and take up the rubbish and dust, which each inhabitant is obliged to sweep together; and though the heat of the climate renders this labour more easy, the same heat obliges them to greater cleanliness in order to preserve the salubrity of the air.

The mosques in Aleppo are numerous, and some few of them magnificent. Before each of them is an area, with a fountain in the middle, designed for ablutions before prayers; and behind some of the larger there are little gardens. There are many large khans, or caravanseras, consisting of a capacious square, on all sides of which are a number of rooms, built on a ground-floor, used occasionally for chambers, ware-houses, or stables. Above stairs there is a colonnade or gallery on every side, in which are the doors of a number of small rooms, wherein the merchants, as well strangers as natives, transact most of their business.

The bazars or market-places are long covered narrow streets, on each side of which are a great number of small shops, just sufficient to hold the tradesman and his goods, the buyer being obliged to stand without. Each separate branch of business has a particular bazar, which is locked up, as well as the streets, an hour and a half after sun-set: but the locks are of wood, though the doors are cased with iron. The slaughter-houses are in the suburbs, open to the fields. The tanners have a khan to work in near the river. To the southward in the suburbs they burn lime; and a little beyond that there is a village where they make ropes and catgut. On the opposite side of the river, to the westward, there is a glass-house, where they make a coarse white glass, in the winter only; for the greatest part of this manufacture is brought from a village 35 miles westward.

The situation of Aleppo, beside the advantage of a rich and fruitful soil, possesses also that of a stream of fresh water, which never becomes dry. This rivulet, which is about as large as that of the Gobelins at Paris, or the New River near London, rises in the mountains of Aentab, and terminates six leagues below Aleppo, in a morass full of wild boars and pelicans. Near Aleppo, its banks, instead of the naked rocks which line them in the upper part of its course, are covered with a fertile earth, and laid out in gardens, or rather orchards, which, in a hot country, and especially in Turkey, cannot but be delightful. The city is in itself one of the most agreeable in Syria, and is perhaps the cleanest and best built of any in Turkey. On whatever side it is approached, its numerous minarets and domes present an agreeable prospect to the eye, fatigued with the continued sameness of the brown and parched plains. In the centre is an artificial mountain surrounded by a dry ditch, on which is a ruinous fortress. From hence we have a fine prospect of the whole city, and to the north discover the snowy tops of the mountains of Bailan; and on the west, those which separate the Orontes from the sea; while to the south and east, the eye can discern as far as the Euphrates. In the time of Omar, this castle stopped the progress of the Arabs for several months, and was at last taken by treachery, but at present would not be able to resist the feeblest assault. Its slight wall, low, and without a buttress, is in ruins; its little old towers are in no better condition; and it has not four can-

non fit for service, not excepting a culverine nine feet long, taken from the Persians at the siege of Bassora. Three hundred and fifty Janisaries, who should form the garrison, are busy in their shops, and the aga scarcely finds room in it to lodge his retinue. It is remarkable that this aga is named immediately by the Porte, which, ever suspicious, divides as much as possible the different offices. Within the walls of the castle is a well, which, by means of a subterraneous communication, derives its water from a spring a league and a quarter distant. In the environs of the city, we find a number of large square stones, on the top of which is a turban of stone, which are so many tombs. There are many rising grounds round it, which, in case of a siege, would greatly facilitate the approaches of the assailants. Such, among others, is that on which the house of the Derviches stands, and which commands the canal and the rivulet: Aleppo, therefore, cannot be esteemed a place of importance in war, though it be the key of Syria to the north; but, considered as a commercial city, it has a different appearance. It is the emporium of Armenia and the Diarbekar; sends caravans to Bagdad and into Persia; and communicates with the Persian gulph and India, by Bassora, with Egypt and Mecca by Damafcus, and with Europe by Skandaroon (Alexandretta) and Latakia. Commerce is there principally carried on by barter. The chief commodities are raw or spun cottons, clumsy linens fabricated in the villages; silk stuffs manufactured in the city, copper, *bourres* (coarse cloths) like those of Rouen, goats hair brought from Natolia; the gall nuts of the Kourdestan, the merchandize of India, such as shawls and muslins, and pistachio nuts of the growth of the neighbourhood. The articles supplied by Europe are the Languedoc cloths, cochineal, indigo, sugar, and some other groceries. The coffee of America, though prohibited, is introduced, and serves to mix with that of Moka. The French have at Aleppo a consul and seven counting-houses; the English and the Venetians two, and the merchants of Leghorn and Holland one. The emperor appointed a consul there in 1784, in the person of a rich Jew merchant, who shaved his beard to assume the uniform and the sword. Russia has also sent one very lately. Aleppo is not exceeded in extent by any city in Turkey, except Constantinople and Cairo, and perhaps Smyrna. The number of inhabitants has been computed at 200,000; but in these calculations certainty is impossible. However, if we observe that this city is not larger than Nantes or Marseilles, and that the houses consist only of one story, we shall perhaps not think it probable they exceed 100,000. The people of this city, both Turks and Christians, are with reason esteemed the most civilized in all Turkey; and the European merchants no where enjoy so much liberty, or are treated with so much respect.

The air of Aleppo is very dry and piercing, but at the same time very salubrious for all who are not troubled with asthmatic complaints. The city, however, and the environs, are subject to a singular endemial disorder, which is called the ringworm or pimple of Aleppo; it is in fact a pimple which is at first inflammatory, and at length becomes an ulcer of the size of the nail. The usual duration of this ulcer is one year

Aleppo. it commonly fixes on the face, and leaves a scar which disfigures almost all the inhabitants. It is alleged that every stranger who resides there three months is attacked with it; experience has taught that the best mode of treatment is to make use of no remedy. No reason is assigned for this malady: but M. Volney suspects it proceeds from the quality of the water, as it is likewise frequent in the neighbouring villages, in some parts of the Diarbekar, and even in certain districts near Damascus, where the soil and the water have the same appearances. Of the Christian inhabitants the greater number are Greeks, next to them the Armenians, then the Syrians, and lastly the Maronites; each of whom have a church in the city called *Judida*; in which quarter, and the parts adjacent, most of them reside. The common language is the vulgar Arabic, but the Turks of condition use the Turkish. Most of the Armenians can speak the Armenian, some few Syrians understand Syriac, and many of the Jews Hebrew; but scarce one of the Greeks understand a word of Greek. The people in general are of a middle stature, and tolerably well proportioned; but they seem neither vigorous nor active. Both sexes are handsome when young: but the beard soon disfigures the men: and the women, as they come early to maturity, also fade very soon; females are generally married from 14 to 18 years of age, and many under 14. The people of rank here are polite and affable, making allowances for that superiority which the Mahometan religion instructs its votaries to assume over all who hold a different faith. Their bread is generally of wheat flour made into thin cakes, but very ill prepared, and is generally eaten as soon as it comes out of the oven. The principal people have small loaves of a finer flour, which are well fermented and baked. Besides these, there are a variety of biscuits, most of which are strewed on the top with some kind of seeds. The Europeans have very good bread, baked and prepared in the French manner. All the inhabitants of both sexes smoke tobacco to great excess; even the very servants have almost constantly a pipe in their mouths. Coaches or carriages are not used here; therefore persons of quality ride on horseback in the city, with a number of servants walking before them, according to their rank: ladies of the first distinction are even compelled to walk on foot in the city, or to any place at a moderate distance; in longer journeys they are carried by mules, in a kind of a couch close covered up. There are a number of public bagnios in this city, which are used by people of all ranks, except those of the highest distinction, who commonly have baths and every other convenience in their own houses. Aleppo is 70 miles east of Scandaroon, on the sea-coast, and 175 north-by-east of Damascus. E. long. 37. 40. N. lat. 36. 12.

ALEPPO (*the Pachalic of*), one of the five governments into which Syria is divided. It comprehends the country extending from the Euphrates to the Mediterranean, between two lines, one drawn from Scandaroon to Beer, along the mountains; the other from Beles to the sea, by Mara and the bridge of Shoger. This space principally consists of two plains; that of Antioch to the west, and that of Aleppo to the east: the north and the sea coast are occupied by considerably high mountains, known to the ancients by the names of Amanus and of Rhofus. In general, the

N^o 10.

soil of this government is fat and loamy. The lofty and vigorous plants which shoot up every where after the winter rains prove its fertility, but its actual fruitfulness is but little. The greatest part of the lands lie waste; scarcely can we trace any marks of cultivation in the environs of the towns and villages. Its principal produce consists in wheat, barley, and cotton, which are found especially in the flat country. In the mountains, they rather choose to cultivate the vine, mulberry, olive, and fig trees. The sides of the hills towards the sea-coast are appropriated to tobacco, and the territory of Aleppo to pistachios. The pasturage is not to be reckoned, because that is abandoned to the wandering hordes of the Turkmen and Curds.

In the greater part of the pachalics the pacha is, as his title imports, at once the viceroys and farmer-general of the country; but in that of Aleppo he does not possess the latter office. This the Porte has bestowed on a *mehaffel* or collector, who is immediately accountable for what he receives. His lease is only for a year. The present rent of his farm is 800 purses (above L. 40,000); but to this must be added the price of the *babouches* (Turkish slippers), or a present of three or four thousand pounds, to purchase the favour of the visir and men in office. For these two sums the farmer receives all the duties of the government; which are, first, The produce of import and export duties on merchandise coming from Europe, India, and Constantinople, and on that exported in exchange. Secondly, The taxes paid by the herds of cattle brought every year by the Turkmen and Curds from Armenia and the Diarbekar, to be sold in Syria. Thirdly, The fifth of the salt-works of Djeboul. And lastly, The miri, or land-tax. These united may produce about L. 60,000.

The pacha, deprived of this lucrative branch of the administration, receives a fixed allowance of about L. 8300. This revenue has always been inadequate to the expences; for, besides the troops he is obliged to maintain, and the reparation of the highways and fortresses, the expences of which he is obliged to defray, he is under the necessity of making large presents to the ministers, in order to keep his place; but the Porte adds to the account the contributions he may levy on the Curds and Turkmen, and his extortions from the villages and individuals; nor do the pachas come short of this calculation. Abdi Pacha, who governed 13 or 14 years ago, carried off, at the end of 15 months, upwards of L. 160,000, by laying under contribution every trade, even the very cleaners of tobacco-pipes; and very lately another of the same name has been obliged to fly for similar oppressions. The former was rewarded by the divan with the command of an army against the Russians; but if the latter has not enriched himself, he will be strangled as an extortioner. Such is the ordinary progress of affairs in Turkey!

In consequence of such wretched government, the greater part of the pachalics in the empire are impoverished and laid waste. This is the case in particular with that of Aleppo. In the ancient *defstars*, or registers of imposts, upwards of 3200 villages were reckoned; but at present the collector can scarcely find 400. Such of our merchants as have resided there 20 years, have themselves seen the greater part of the environs

Aleria || **Alesia**
 environs of Aleppo become depopulated. The traveller meets with nothing but houses in ruins, cisterns rendered useless, and fields abandoned. Those who cultivated them are fled into the towns, where the population is absorbed, but where at least the individual conceals himself among the crowd from the rapacious hand of despotism.

ALERIA, ALALIA, or ALARIA, (anc. geog.), a town of Corsica, situated near the middle of the east side of the island, on an eminence, near the mouth of the river Rotanus mentioned by Ptolomy; built by the Phocæans (Diodorus Siculus.) Afterwards Sylla led a colony thither. It is now in ruins, and called *Aleria Disfruttia*.

ALES (Alexander), a celebrated divine of the confession of Augsbourg, born at Edinburgh the 23d of April 1500. He soon made a considerable progress in school-divinity, and entered the lists very early against Luther, this being then the great controversy in fashion, and the grand field wherein all authors young and old used to display their abilities. Soon after, he had a share in the dispute which Patrick Hamilton maintained against the ecclesiastics, in favour of the new faith he had imbibed at Marpurgh. He endeavoured to bring him back to the Catholic religion; but this he could not effect, and even began himself to doubt about his own religion, being much affected by the discourse of this gentleman, and still more by the constancy he showed at the stake, where David Beton archbishop of St Andrew's caused him to be burnt. Beginning thus to waver, he was himself persecuted with so much violence, that he was obliged to retire into Germany, where he became at length a perfect convert to the Protestant religion. The change of religion which happened in England after the marriage of Henry VIII. with Anna Bullen, induced Ales to go to London in 1535. He was highly esteemed by Cranmer archbishop of Canterbury, Latimer, and Thomas Cromwel, who were at that time in high favour with the king. Upon the fall of these favourites, he was obliged to return to Germany; where the elector of Brandenburg appointed him professor of divinity at Francfort upon the Oder, in 1540. But leaving this place upon some disgust, he returned to Leipzig, where he was chosen professor of divinity, and died in March 1565. He wrote a Commentary on St John, on the Epistles to Timothy, and on the Psalms, &c.

ALESA, ALËSA, or HALESA, (anc. geog.), a town of Sicily, on the Tuscan sea, built, according to Diodorus Siculus, by Archonides of Herbita, in the second year of the 94th Olympiad, or 403 years before Christ; situated on an eminence about a mile from the sea; now in ruins. It enjoyed immunity from taxes under the Romans (Diodorus, Cicero). The inhabitants were called *Halesini* (Cicero, Pliny); also *Alesini*, and *Alesini*.

ALESHAM, a small neat town in Norfolk. It is 15 miles N. of Norwich, and 121 N. E. by N. of London. E. Long. 0. 30. N. Lat. 52. 53. The town consists of about 400 pretty good houses; but the streets are narrow, though well paved.

ALESIA, (anc. geog.) called *Alexia* by Livy and others; a town of the Mandubii, a people of Celtic Gaul; situated, according to Cæsar, on a very high hill, whose foot was washed on two sides by two rivers.

VOL. I. Part I.

The town was of such antiquity, that Diodorus Siculus relates it was built by Hercules. It is supposed to be the city of *Alise*, in the duchy of Burgundy, not far from Dijon.

Alet || **Alexander.**

ALET, a town of France, in Lower Languedoc, with a bishop's see. It is remarkable for its baths, and for the grains of gold and silver found in the stream which runs from the Pyrenean mountains, at the foot of which it stands. It is seated on the river Aude, 15 miles S. of Carcaffone, and 37 N. W. of Narbonne. E. Long. 2. 5. N. Lat. 42. 59.

ALETRIS, in botany, a genus of the monogynia order, belonging to the hexandria class of plants, and in the natural method ranking under the 10th order, *Coronarieæ*. The characters are: The *corolla* is monopetalous, funnel-shaped, hexangular, much corrugated, femiquinquefid, and persistent: The *stamina* consist of six subulated filaments, the length of the corolla, and inserted into the base of the divisions of the corolla; the antheræ are oblong and erect: The *psistillum* has an ovate germen; the stylus subulated, and the length of the stamina; the stigma is trifid: The *pericarpium* is an ovate capsule, triquetrous, pointed, and triocular: The *seeds* are numerous. Of this genus botanical writers enumerate five

Species. 1. The *farinosa*, a native of Virginia, and other parts of North America. 2. The *capensis*, a native of the Cape of Good Hope. 3. The *hyacinthoides*, or Guinea aloe. 4. The *zeylanica*, or Ceylon aloe. 5. The *fragrans*, or tree-aloe, a native of Africa. Of these only the first is so hardy as to outlive the winter in Britain, unless placed in a stove; and even this requires to be sheltered under a frame. The flowers appear in June or July, of a whitish green colour. The third and fifth produce fine spikes of white flowers; those of the third kind appearing in July, of the fifth in March or April. By proper management the last kind becomes a stately plant, rising to the height of 12 or 14 feet; the flowers open wide in the evening, and perfume the air of the stove. These send out one or two heads, or tufts, towards their tops, which may be cut off; and after they have lain a week in the stove to heal the wounded parts, they may be planted for increase. The other species seldom or never flower in this country, nor does their appearance otherwise merit notice.

ALETUM, or ALETA, (anc. geog.) a town of Celtic Gaul, now extinct. From its ruins arose St Malo, in Brittany, at the distance of a mile. Its ruins are called *Guich Aleth* in the British.

ALEUROMANCY, the same with what was otherwise called *alphetomantia*, and *critibomantia*, and means an ancient kind of divination performed by means of meal or flower.

ALEXANDER THE GREAT, king of Macedonia. His father Philip laid the plan of that extensive empire, which his son afterwards executed.—Philip, having made himself master of Greece, began to cast his eyes upon Persia, with a view to retaliate upon that haughty empire the injuries of former times. It was the popular topic of the day. But this prince was cut off in the midst of his enterprise. Such, however, was the influence of Alexander in the assembly of the Grecian states, that he was created general of their combined forces in the room of his father. Having made every

Alexander. needful preparation, at the head of a veteran army he invaded Asia. The lieutenants of Darius, who was then king of Persia, opposed him at the river Granicus, where Alexander obtained a complete victory, after which he pursued his march through Asia. At Issus, near Scanderoon, he was met by Darius in person, at the head of a prodigious army. Here he obtained a second victory; and took the camp of Darius, together with his family, whom he treated with the utmost humanity. Contrary to all the maxims of war, instead of pursuing Darius, he made an excursion into Egypt; and, as far as appears, through no better motives than those of vanity. Here he was acknowledged to be the son of Jupiter Ammon. In the mean time Darius recruited his strength, and got together an army superior to what he brought into the plain of Issus. Alexander having finished his Egyptian expedition, traversed Asia, and passed the Euphrates. At Arbella, a town in Assyria, he met Darius. Here a decisive battle was fought, which put all Persia into the hands of Alexander. His ambition not being satisfied with the conquest of that vast country, he projected an expedition into India. Here he met with great opposition from Porus, a gallant prince, whom in the end he reduced. Beyond the Ganges lay a country still unsubdued. He notified it to his army, that he proposed to pass the river. But these veterans, harrassed with the fatigues, and seeing no end of their labour, mutinied, and refused to march further. The disappointed chief was therefore obliged to return. At Babylon he proposed to receive ambassadors, appoint governors, and settle his vast monarchy; but his excesses put an end to his life in the midst of his designs, and in the flower of his age.

The character of this hero is so familiar to every body, that it is almost needless labour to draw it. All the world knows, says Mr Bayle, that it was equally composed of very great virtues and very great vices. He had no mediocrity in any thing but his stature: in his other properties, whether good or bad, he was all extremes. His ambition rose even to madness. His father was not at all mistaken in supposing the bounds of Macedon too small for his son: for how could Macedon bound the ambition of a man, who reckoned the whole world too small a dominion? He wept at hearing the philosopher Anaxarchus say, that there was an infinite number of worlds: his tears were owing to his despair of conquering them all, since he had not yet been able to conquer one. Livy, in a short digression, has attempted to enquire into the events which might have happened, if Alexander, after the conquest of Asia, had brought his arms into Italy? Doubtless things might have taken a very different turn with him; and all the grand projects, which succeeded so well against an effeminate Persian monarch, might easily have miscarried if he had to do with rough hardy Roman armies. And yet the vast aims of this mighty conqueror, if seen under another point of view, may appear to have been confined in a very narrow compass; since, as we are told, the utmost wish of that great heart, for which the whole earth was not big enough, was, after all, to be praised by the Athenians: for it is related, that the difficulties which he encountered in order to pass the Hydaspes, so ced him to cry out, "O Athenians, could you believe to what dangers I

expose myself for the sake of being celebrated by Alexander you?" But Bayle affirms, that this was quite consistent with the vast unbounded extent of his ambition, as he wanted to make all future time his own, and be an object of admiration to the latest posterity; yet did not expect this from the conquest of worlds, but from books. He was perfectly in the right, says Bayle; "for if Greece had not furnished him with good writers, he would long ago have been as much forgotten as the kings who reigned in Macedon before." "Amphitryon."

Alexander has been praised upon the score of continency, yet his life could not surely be quite regular in that respect. Indeed, the fire of his early youth appeared so cold towards women, that his mother suspected him to be impotent; and, to satisfy herself in this point, did, with the consent of Philip, procure a very handsome courtesan to lie with him, whose carresses, however, were all to no purpose. His behaviour afterwards to the Persian captives shows him to have had a great command over himself in this particular. The wife of Darius was a finished beauty; her daughters likewise were all beauties; yet this young prince, who had them in his power, not only bestowed on them all the honours due to their high rank, but managed their reputation with the utmost delicacy. They were kept as in a cloyster concealed from the world, and secured from the reach of every dishonourable (not only attack, but) imputation. He did not give the least handle to scandal, either by his visits, his looks, or his words: and for other Persian dames his prisoners, equally beautiful in face and shape, he contented himself with saying gaily, that they gave indeed much pain to his eyes. The amazon Thalestris could not obtain from him a compliance with her gallant request till after a delay of thirteen days. In the mean time, what are we to conclude from his causing his favourite mistress Pancaete to be drawn naked by Apelles, tho' it is true he gave her to the painter, who fell in love with her? What of that immoderate love of boys, which Athenæus relates of him? What of that prodigious number of wives and concubines which he kept?

His excesses with regard to wine were notorious, and beyond all imagination; and he committed, when drunk, a thousand extravagancies. It was owing to wine, that he killed Clytus who saved his life, and burnt Persepolis, one of the most beautiful cities of the East: he did this last indeed at the instigation of the courtesan Thais; but this circumstance made it only the more heinous. It is generally believed, that he died by drinking immoderately: and even Plutarch, who affects to contradict it, owns that he did nothing but drink the whole day he was taken ill.

In short, to sum up the character of this prince, we cannot be of opinion, that his good qualities did in any wise compensate for his bad ones. Heroes make a noise: their actions glare, and strike the senses forcibly; while the infinite destruction and misery they occasion lies more in the shade, and out of sight. One good legislator is worth all the heroes that ever did or will exist. See MACEDON.

ALEXANDER AB ALEXANDRO, a Neapolitan lawyer, of great learning, who flourished toward the end of the 15th and beginning of the 16th century. He followed the profession of the law first at Naples, afterwards

Alexander. afterwards at Rome: but he devoted all the time he could spare to the study of polite literature; and at length he entirely left the bar, that he might lead a more easy and agreeable life with the muses. The particulars of his life are to be gathered from his work intitled *Genialium Dierum*: We are there informed, that he lodged at Rome, in a house that was haunted; and he relates many surprizing particulars about the ghost: he says also, that when he was very young, he went to the lectures of Philelphus, who explained at Rome the Tusculan questions of Cicero; he was there also when Nicholas Perot and Domitius Calderinus read their lectures upon Martial. The particular time when he died is not known; but he was buried in the monastery of the Olivets. Tiraquea wrote a learned commentary upon his work, which was printed at Lyons in 1587, and reprinted at Leyden in 1673, with the notes of Dennis Godfrey, Christopher Colerus, and Nicholas Mercerus.

ALEXANDER (Neckham), an eminent English writer in the 12th and 13th centuries, born at St Albans in Hertfordshire. In 1215 he was made abbot of Exeter, and died in 1227. He wrote several works, which were never published; but they are to be found in manuscript in the libraries of England and other countries.

ALEXANDER (Noel) an indefatigable writer of the 17th century, born at Roan in Normandy, 1639. After finishing his studies at Roan, he entered into the order of Dominican friars, and was professed there in 1655. Soon after he went to Paris, to go through a course of philosophy and divinity in the great convent, where he distinguished himself so, that he was appointed to teach philosophy there, which he did for 12 years. Mr Colbert showed him many marks of his esteem; and being determined to omit nothing to perfect the education of his son, afterwards archbishop of Roan, he formed an assembly of the most learned persons, whose conferences upon ecclesiastical history might be of advantage to him. Father Alexander was invited to this assembly, where he exerted himself with so much genius and ability, that he gained the particular friendship of young Colbert, who showed him the utmost regard as long as he lived. These conferences gave rise to Alexander's design of writing an ecclesiastical history; for, being desired to reduce what was material in these conferences to writing, he did it with so much accuracy, that the learned men who composed this assembly, advised him to undertake a complete body of church-history. This he executed with great assiduity, collecting and digesting the materials himself, and writing even the tables with his own hand. He at last completed his work in 1686. Towards the latter part of his life, he was afflicted with the loss of his sight; a most inexpressible misfortune to one whose whole pleasure was in study, yet he bore it with great patience and resignation. He died merely of a decay of nature, 1724, in the 86th year of his age.

ALEXANDER SEVERUS, emperor of Rome, succeeded Heliogabalus about A. D. 222, when but 16 years of age. His mother's name was Mammaea, and by her advice he in a great measure regulated his conduct. He applied himself to the reformation of abuses, the state having been greatly disordered by the vicious conduct of his predecessor; he was a most strict lover of justice,

an encourager of learning and learned men, and favourable to the Christians. He made a successful expedition against the Persians; but endeavouring to reform his troops, which had grown very licentious under the late bad government, they murdered him at the instigation of Maximinus in the 29th year of his age, together with his mother, A. D. 235.

ALEXANDER VI. (Pope), had four bastards when he was cardinal, for one of which he had so great affection, that he stuck at nothing to raise him. Designing to poison some cardinals, he was poisoned himself, A. D. 1503. See BORGIA.

ALEXANDER VII. (Pope). See CHIGI.

ALEXANDER Bishop of Lincoln in the reigns of Henry I. and Stephen, was a Norman by birth, and nephew of the famous Roger, bishop of Salisbury, who first made him archdeacon of Salisbury, and afterwards, by his interest with the king, raised him to the mitre. Alexander was consecrated at Canterbury, July 22. 1123. Having received his education under his uncle the bishop of Salisbury, and been accustomed to a splendid way of living, he affected show and state more than was suitable to his character, or consistent with his fortunes. This failing excepted, he was a man of worth and honour, and every way qualified for his station. The year after his consecration, his cathedral church at Lincoln having been accidentally burnt down, he rebuilt it, and secured it against the like accident for the future by a stone roof. This prelate increased the number of prebends in his church, and augmented its revenues with several manors and estates. In imitation of the barons and some of the bishops, particularly his uncle the bishop of Salisbury, he built three castles; one at Banbury, another at Sleaford, and a third at Newark. He likewise founded two monasteries; one at Haverholm, for regular canons and nuns together, the other at Tame for white-friars. He went twice to Rome in the years 1142 and 1144. The first time, he came back in quality of the pope's legate, for the calling a synod, in which he published several wholesome and necessary canons. In August 1147, he took a third journey to the pope, who was then in France; where he fell sick through the excessive heat of the weather, and returning with great difficulty to England, he died in the 24th year of his prelacy.

ALEXANDER (William), earl of Stirling, an eminent Scots statesman and poet in the reigns of James I. and Charles I. who, after travelling with the duke of Argyll as his tutor or companion, wrote a poetical complaint of his unsuccessful love of some beauty, under the title of *Aurora*. He then removed to the court of James VI. where he applied to the more solid parts of poetry, forming himself upon the plan of the Greek and Roman tragedians. In 1607, he published some dramatic performances, intitled *The Monarchic Tragedies*, dedicated to king James; who was so well pleased with them, as to call him his philosophical poet. After this, he is said to have written *A supplement* to complete the third part of Sir Philip Sidney's *Arcadia*; and in 1613, he produced a poem called *Doomsday, or the Great Day of Judgment*. He was made gentleman-usher to prince Charles, and master of the requests; was knighted; and obtained a grant of Nova Scotia, where he projected the settlement of a colony, but afterward sold it to the French. In 1626, he was made secretary of state for

Alexander || Scotland; was created first viscount, and then earl, of
Alexan- dretta. Stirling; and died in 1640.

ALEXANDER I. (St), whom St Ireneus reckons the fifth bishop of Rome, succeeded St Evaristus in the year 109, and died in the year 119. There is no account of his life; and the epistles which are attributed to him are supposititious.

ALEXANDER II. king of Scotland, succeeded his father William in 1213, at 16 years of age. He made an expedition into England, to oppose the tyranny of king John; who returned the visit, and was offered battle by Alexander, but refused it. He took the city of Carlisle from Henry III. which was afterwards exchanged for Berwick. Alexander died in 1249, in the 51st year of his age, and 35th of his reign; and left for his successor, his son—

ALEXANDER III. who was crowned king of Scotland in 1249. The Cummings, lords of Scotland, took arms against him; and taking him prisoner, confined him at Striveling: but he was afterwards released by his subjects. He married the daughter of Henry III. king of England; and was at length killed by a fall from his horse, on the 10th of April 1290, after having reigned 42, or according to others 37, years.

ALEXANDERS, in botany. See SMYRNIUM.

ALEXANDREA, (anc. geog.) a mountain of Myfia, on the sea-coast, forming a part of mount Ida, where Paris gave judgment on the three goddesses.

ALEXANDRETTA, by the Turks called *Scanderoon*; a town in Syria, at the extremity of the Mediterranean sea. It is the port of Aleppo, from which it is distant 28 or 30 leagues. It is now, properly speaking, nothing else but a village, without walls, in which the tombs are more numerous than the houses, and which entirely owes its existence to the road which it commands. This is the only road, in all Syria, where vessels anchor on a solid bottom, without their cables being liable to chafe: but in other respects it has many inconveniences. It is infested, during winter, by a peculiar wind, called by the French sailors *le Raguier*, which, rushing from the snowy summits of the mountains, frequently forces ships to drag their anchors several leagues: And when the snow begins to cover the mountains which surround the Gulph, tempestuous winds arise which prevent vessels from entering for three or four months together. The road also to Aleppo by the plain is infested by Curd robbers, who conceal themselves in the neighbouring rocks, and frequently attack and plunder the strongest caravans. But the worst circumstance is the extreme unwholesomeness of the air, occasioned here by stagnant waters and mephitic exhalations. It may be affirmed, that this every year carries off one-third of the crews of the vessels which remain here during the summer; nay, ships frequently lose all their men in two months. The season for this epidemic disorder is principally from May to the end of September: it is an intermitting fever of the most malignant kind; and is accompanied with obstructions of the liver, which terminate in a dropsy. To this baneful epidemic, Alexandretta, from its situation, seems to be irremediably condemned: for the plain on which the town is built is so low and flat, that the rivulets, finding no declivity, can never reach the sea. When they are swelled by the winter rains, the sea, swelled likewise by tempests, hinders their discharging

themselves into it: hence their waters, forced to spread themselves, form lakes in the plain. On the approach of the summer, the waters becoming corrupted by the heat, exhale vapours equally corrupt, and which cannot disperse, being confined by the mountains that encircle the gulph. The entrance of the bay besides lies to the west, which in those countries is the most unhealthy exposure when it corresponds with the sea. The labour necessary to remedy this would be immense, and after all insufficient; and, indeed, such an undertaking would be absolutely impossible under a government like that of the Turks. A few years ago, Mr Volney informs us, the merchants of Aleppo, disgusted with the numerous inconveniences of Alexandretta, wished to abandon that port and carry the trade to Latakia. They proposed to the Pacha of Tripoli to repair the harbour at their own expence, provided he would grant them an exemption from all duties for ten years. To induce him to comply with their request, the agent they employed talked much of the advantage which would, *in time*, result to the whole country: "But what signifies it to me what may happen *in time*," replied the Pacha? I was yesterday at Marach; tomorrow, perhaps, I shall be at Djedda: Why should I deprive myself of present advantages, which are certain, for future benefits I cannot hope to partake?" The European factors were obliged therefore to remain at Skandaroon. There are three of these factors, two for the French, and one for the English and Venetians. The only curiosity which they have to amuse strangers with consists in six or seven marble monuments, sent from England, on which you read: *Here lies such a one, carried off in the flower of his age, by the fatal effects of a contagious air.* The sight of these is the more distressing, as the languid air, yellow complexion, livid eyes, and dropical bellies of those who show them, make it but too probable they cannot long escape the same fate. It is true, they have some resource in the village of Bailan, the pure air and excellent waters of which surprizingly restore the sick. The Aga, for some years past, has applied the duties of the custom-house of Alexandretta to his own use, and rendered himself almost independent of the Pacha of Aleppo. The Turkish empire is full of such rebels, who frequently die in peaceable possession of their usurpations.

ALEXANDRIA, now *Scandaria*, by Athenæus called *Ἐρμούσι*; a city of Lower Egypt, and for a long time its capital. This city was built by Alexander the Great, soon after the overthrow of Tyre, about 333 years before Christ. It is situated on the Mediterranean, twelve miles west of that mouth of the Nile anciently called *Canopicum*; and lies in E. Long. 30. 19. N. Lat. 31. 10.

Alexander is said to have been induced to build this city, on account of its being conveniently situated for a fine port; and so sudden was his resolution, that after he had directed where every public structure was to be placed, fixed the number of temples, and the deities to whom they should be dedicated, &c. there were no instruments at hand proper for marking out the walls, according to the custom of those times. Upon this, a workman advised the king to collect what meal was among the soldiers, and to sift it in lines upon the ground, whereby the circuit of the walls would be sufficiently marked out. This advice was followed; and

Alexan- dretta, Alexandria

and the new method of marking out the walls was, by Aristander, the king's soothsayer, interpreted as a preface of the city's abounding with all the necessaries of life. Nor was he deceived in his prediction; for Alexandria soon became the staple, not only for merchandise, but also for all the arts and sciences of the Greeks.

Alexandria was a league and a half long, by one-third in breadth, which made the circumference of its walls about four leagues. Lake Mareotis bathed its walls on the south, and the Mediterranean on the north. It was intersected lengthwise by straight parallel streets. This direction left a free passage to the northerly wind, which alone conveys coolness and salubrity into Egypt. A street of 2000 feet wide began at the gate of the sea, and terminated at the gate of Canopus. It was decorated by magnificent houses, by temples, and by public buildings. In this extensive range, the eye was never tired with admiring the marble, the porphyry, and the obelisks, which were destined at some future day to embellish Rome and Constantinople. This street, the handsomest in the universe, was intersected by another of the same breadth, which formed a square at their junction of half a league in circumference. From the middle of this great place, the two gates were to be seen at once, and vessels arriving under full sail from the north and from the south.

A mole of a mile in length stretched from the continent to the isle of Pharos, and divided the great harbour into two. That which is to the northward preserved its name. A dyke drawn from the island to the rock whereon was built the Pharos, secured it from the westerly winds. The other was called *Eunostos*, or the Safe Return. The former is called at present the new, the latter the old harbour: a bridge that joins the mole to the city, served for a communication between them. It was raised on lofty pillars sunk into the sea, and left a free passage for ships. The palace, which advanced beyond the promontory of *Lochias*, extended as far as the dyke, and occupied more than a quarter of the city. Each of the Ptolemies added to its magnificence. It contained within its inclosure, the museum, an asylum for learned men, groves, and buildings worthy of royal majesty, and a temple where the body of Alexander was deposited in a golden coffin. The infamous Seleucus Cibyofactes violated this monument, carried off the golden coffin, and put a glass one in its place. In the great harbour was the little island of Anti-Rhodes, where stood a theatre, and a royal place of residence. Within the harbour of *Eunostos* was a smaller one, called *Kibotos*, dug by the hand of man, which communicated with Lake Mareotis by a canal. Between this canal and the palace was the admirable temple of Serapis, and that of Neptune near the great place where the market was held. Alexandria extended likewise along the southern banks of the lake. Its eastern part presented to view the gymnasium, with its porticoes of more than 600 feet long, supported by several rows of marble pillars. Without the gate of Canopus was a spacious circus for the chariot races. Beyond that, the suburb of Nicopolis ran along the seashore, and seemed a second Alexandria. A superb amphitheatre was built there with a race-ground, for the celebration of the quinquennialia.

Such is the description left us of Alexandria by the ancients, and above all by Strabo.

The architect employed by Alexander in this undertaking was the celebrated Dinocrates, who had acquired so much reputation by rebuilding the temple of Diana at Ephesus. The city was first rendered populous by Ptolemy Soter, one of Alexander's captains, who, after the death of the Macedonian monarch, being appointed governor of Egypt, soon assumed the title of king, and took up his residence at Alexandria, about 304 years before Christ.

In the 30th year of Ptolemy Soter's reign, he took his son Ptolemy Philadelphus partner with him in the empire; and by this prince the city of Alexandria was much embellished. In the first year of his reign the famous watch-tower of Pharos was finished. It had been begun several years before by Ptolemy Soter; and, when finished, was looked upon as one of the wonders of the world. The same year, the island of Pharos itself, originally seven furlongs distant from the continent, was joined to it by a causeway. This was the work of Dexiphanes, who completed it at the same time that his son put the last hand to the tower. The tower was a large square structure of white marble; on the top of which fires were kept constantly burning, for the direction of sailors. The building cost 800 talents; which, if Attic, amounted to L. 165,000; if Alexandrian, to twice that sum.

The architect employed in this famous structure fell upon the following contrivance to usurp the whole glory to himself.—Being ordered to engrave upon it the following inscription, "King PTOLEMY to the Gods the Saviours, for the benefit of Sailors;" instead of the king's name he substituted his own, and then filling up the hollow of the marble with mortar, wrote upon it the above mentioned inscription. In process of time, the mortar being wore off, the following inscription appeared: "SOSTRATUS the Cnidian, the son of DEXIPHANES, to the Gods the Saviours, for the benefit of Sailors."

This year also was remarkable for the bringing of the image of Serapis from Pontus to Alexandria. It was set up in one of the suburbs of the city called *Rhacotis*, where a temple was afterwards erected to his honour, suitable to the greatness of that stately metropolis, and called, from the god worshipped there, *Serapeum*. This structure, according to Ammianus Marcellinus, surpassed in beauty and magnificence all others in the world, except the capitol at Rome.—Within the verge of this temple was the famous Alexandrian library. It was founded by Ptolemy Soter, for the use of an academy he instituted in this city; and, by continual additions by his successors, became at last the finest library in the world, containing no fewer than 700,000 volumes. The method followed in collecting books for this library, was, to seize all those which were brought into Egypt by Greeks or other foreigners. The books were transcribed in the museum by persons appointed for that purpose; the copies were then delivered to the proprietors, and the originals laid up in the library. Ptolemy Euergetes, having borrowed from the Athenians the works of Sophocles, Euripides, and Æschylus, returned them only the copies, which he caused to be transcribed in as beautiful a manner as possible; presenting the Athenians at the same time with fifteen talents (upwards of L. 3000 Sterling) for the exchange.

Alexandria. As the museum was at first in that quarter of the city called *Bruchion*, near the royal palace, the library was placed there likewise; but when it came to contain 400,000 volumes, another library, within the Serapeum, was erected by way of supplement to it, and on that account called the *daughter* of the former. In this second library 300,000 volumes, in process of time, were deposited; and the two together contained the 700,000 volumes already mentioned. In the war carried on by Julius Cæsar against the inhabitants of this city, the library in the *Bruchion*, with the 400,000 volumes it contained, was reduced to ashes. The library in the Serapeum, however, still remained; and here Cleopatra deposited 200,000 volumes of the Pergamean library, which Marc Antony presented her with. These, and others added from time to time, rendered the new library at Alexandria more numerous and considerable than the former; and though it was often plundered during the revolutions and troubles of the Roman empire, yet it was again and again repaired, and filled with the same number of books.

For 293 years Alexandria was held in subjection by the Ptolemies. Here is a list of these princes, with the dates of their respective reigns.

Ptolemy the son of Lagus, surnamed *Soter*, reigned 39 years, and died in the year of the world 3720. Ptolemy Philadelphus reigned 39 years, and died in 3758. Ptolemy Euergetes reigned 25 years, and died in 3783. Ptolemy Philopator reigned 17 years, and died in 3800. Ptolemy Epiphanes reigned 24 years, and died in 3824. Ptolemy Philometor reigned 37 years, and died in 3861. Ptolemy Euergetes, or *Phyfeon*, reigned 53 years, part with his brother *Philometer* and part alone. He died in 3888. Ptolemy Lathyrus reigned 36 years six months. He died in 3923. Cleopatra, the daughter of Lathyrus and wife of Alexander I. reigned six months. Alexander I. the nephew of Lathyrus, was established in 3924 and died in 3943. Alexander II. the son of Alexander I. was dispossessed by the Alexandrians in 3939. Ptolemy Nothus, or *Auletes*, the son of Lathyrus, reigned 13 years, and died in 3953. Ptolemy, surnamed *Dionysius* or *Bacchus*, reigned three years eight months, and died in 3957. Cleopatra reigned from 3957, and killed herself in 3974.

This city, as we have already observed, soon became extremely populous, and was embellished both by its own princes and the Romans; but, like most other noted cities of antiquity, hath been the seat of terrible massacres. About 141 years before Christ, it was almost totally depopulated by Ptolemy *Phyfeon*. That barbarous monster, without the least provocation, gave free liberty to his guards to plunder his metropolis and murder the inhabitants at their pleasure. The cruelties practised on this occasion cannot be expressed; and the few who escaped were so terrified that they fled into other countries. Upon this, *Phyfeon*, that he might not reign over empty houses, invited thither strangers from the neighbouring countries; by whom the city was re-peopled, and soon recovered its former splendor. On this occasion many learned men having been obliged to fly, proved the means of reviving learning in Greece, Asia Minor, the islands of the Archipelago, and other places, where it was almost totally lost.

The new inhabitants were not treated with much more kindness by *Phyfeon* than the old ones had been; for, on their complaining of his tyrannical behaviour, he resolved on a general massacre of the young men. Accordingly, when they were one day assembled in the gymnasium, or place of their public exercises, he ordered it to be set on fire; so that they all perished, either in the flames, or by the swords of his mercenaries, whom the tyrant had placed at all the avenues.

Though Julius Cæsar was obliged to carry on a war for some time against this city, it seems not to have suffered much damage, except the burning of the library already mentioned. Before Cæsar left Alexandria, in acknowledgment of the assistance he had received from the Jews, he confirmed all their privileges there, and even engraved his decree on a pillar of brass. This, however, did not prevent the massacre of 50,000 of them in this city about the year of Christ 67.

The city of Alexandria seems to have fallen into decay soon after this, and to have forfeited many of its ancient privileges, tho' for what offence is not known; but when Adrian visited Egypt, about the year 141, it was almost totally ruined. He repaired both the public and private buildings, not only restoring the inhabitants to their ancient privileges, but heaping new favours upon them; for which they returned him their solemn thanks, and conferred upon him what honours they could while he was present; but as soon as he was gone, they published the most bitter and virulent lampoons against him.

The fickle and satirical humour of the Alexandrians was highly disliked by Adrian, though he inflicted no punishment upon them for it; but when they lampooned Caracalla, he did not let them escape so easily. That tyrant, in the year 215, when he visited their city, having become the subject of their foolish satires, ordered a general massacre by his numerous troops, who were dispersed all over the city. The inhuman orders being given, all were murdered, without distinction of age or sex; so that in one night's time the whole city floated in blood, and every house was filled with carcasses. The monster who occasioned this had retired during the night to the temple of Serapis, to implore the protection of that deity; and, not yet fatigued with slaughter, commanded the massacre to be continued all the next day; so that very few of the inhabitants remained. As if even this had not been sufficient, he stripped the city of all its ancient privileges; suppressed the academy; ordered all strangers who lived there to depart; and that the few who remained might not have the satisfaction of seeing one another, he cut off all communication of one street with another, by walls built for that purpose, and guarded by troops left there.

Notwithstanding this terrible disaster, Alexandria soon recovered its former splendor, as Caracalla was murdered a short time after. It was long esteemed the first city in the world, next to Rome; and we may judge of its magnificence, and the multitude of people contained in it, from the account of Diodorus Siculus, who relates, that in his time (44 years before Christ) Alexandria had on its rolls 300,000 freemen. Towards the middle of the sixth century, Amrou *Ebn el Aas*, Omar's general, took it by storm, after a siege of

Alexandria. of 14 months, and with the loss of 23,000 men. Heraclius, then emperor of Constantinople, did not send a single ship to its assistance. This prince affords an example very rare in history; he had displayed some vigour in the first year of his reign, and then suffered himself to be lulled into idleness and effeminacy. Awakened suddenly from his lethargy by the noise of the conquests of Cosroes, that scourge of the east, he put himself at the head of his armies, distinguished himself as a great captain from his very first campaign, laid waste Persia for seven years, and returned to his capital covered with laurels: he then became a theologian on the throne, lost all his energy, and amused himself the rest of his life with disputing upon Monotheism, whilst the Arabs were robbing him of the finest provinces of his empire. Deaf to the cries of the unfortunate inhabitants of Alexandria, as he had been to those of the people of Jerusalem, who defended themselves for two years, he left them a sacrifice to the fortunate ascendant of the indefatigable Amrou. All their intrepid youth perished with their arms in their hands.

The victor, astonished at his conquest, wrote to the caliph, "I have taken the city of the west. It is of an immense extent. I cannot describe to you how many wonders it contains. There are 4000 palaces, 4000 baths, 12,000 dealers in fresh oil, 12,000 gardeners, 40,000 Jews who pay tribute, 400 comedians," &c.

At this time, according to the Arabian historians, Alexandria consisted of three cities, *viz. Menna*, or the port, which included Pharos, and the neighbouring parts; *Alexandria*, properly so called, where the modern Scanderia now stands; and *Nekita*, probably the Necropolis of Josephus and Strabo.

At that time John, surnamed *the grammarian*, a famous Peripatetic philosopher, being in the city, and in high favour with Amrou Ebn al Aas the Saracen general begged of him the royal library. Amrou replied, that it was not in his power to grant such a request; but that he would write to the khalif on that head; since, without knowing his pleasure, he dared not to dispose of a single book. He accordingly wrote to Omar, who was then khalif, acquainting him with the request of his friend: To which the ignorant tyrant replied, That if those books contained the same doctrine with the koran, they could be of no use, since the koran contained all necessary truths; but if they contained any thing contrary to that book, they ought not to be suffered; and therefore, whatever their contents were, he ordered them to be destroyed. Pursuant to this order, they were distributed among the public baths; where, for the space of six months, they served to supply the fires of those places, of which there was an incredible number in Alexandria.

After the city was taken, Amrou thought proper to pursue the Greeks who had fled farther up the country; and therefore marched out of Alexandria, leaving but a very slender garrison in the place. The Greeks, who had before fled on board their ships, being apprised of this, returned on a sudden, surprised the town, and put all the Arabs they found therein to the sword: but Amrou, receiving advice of what had happened, suddenly returned, and drove them out of it with great slaughter; after which the Greeks were so intimidated,

that he had nothing farther to fear from them.—A few years after, however, Amrou being deprived of his government by the khalif Othman, the Egyptians were so much displeas'd with his dismissal that they inclined to a revolt; and Constantine the Greek emperor, having received intelligence of their disaffection, began to meditate the reduction of Alexandria. For this purpose, he sent one Manuel, an eunuch, and his general, with a powerful army, to retake that place; which, by the assistance of the Greeks in the city, who kept a secret correspondence with the imperial forces while at sea, and joined them as soon as they had made a descent, he effected, without any considerable effusion of Christian blood. The khalif, now perceiving his mistake, immediately restored Amrou to his former dignity. This step was very agreeable to the natives; who having had experience of the military skill and bravery of this renowned general, and apprehending that they should be called to an account by the Greeks for their former perfidious conduct, had petitioned Othman to send him again into Egypt.—Upon Amrou's arrival, therefore, at Alexandria, the Copts or natives, with the traitor Al-Mokawkas (who had formerly betrayed to Amrou the fortrefs of Mefr) at their head, not only joined him, but supplied him with all kinds of provisions, exciting him to attack the Greeks without delay. This he did; and, after a most obstinate dispute which lasted several days, drove them into the town, where, for some time, they defended themselves with great bravery, and repelled the utmost efforts of the besiegers. This so exasperated Amrou, that he swore, "If God enabled him to conquer the Greeks, he would throw down the walls of the city, and make it as easy of access as a *barvly-house*, which lies open to every body." Nor did he fail to execute this menace; for having taken the town by storm, he quite dismantled it, entirely demolishing the walls and fortifications. The lives of the citizens, however, were spared, at least as far as lay in the general's power; but many of them were put to the sword by the soldiers on their first entrance. In one quarter particularly, Amrou found them butchering the Alexandrians with unrelenting barbarity; to which, however, by his seasonable interposition, he put a stop, and on that spot erected a mosque, which he called *the mosque of mercy*.

From this time Alexandria never recovered its former splendor. It continued under the dominion of the khalifs till the year 924, when it was taken by the Magrebians, two years after its great church had been destroyed by fire. This church was called by the Arabs *Al Kaisaria*, or *Cæsarea*; and had formerly been a pagan temple, erected in honour of Saturn by the famous queen Cleopatra.

The city was soon after abandoned by the Magrebians; but in 928 they again made themselves masters of it: their fleet being afterwards defeated by that belonging to the khalif, *Abul Kasem* the Magrebian general retired from Alexandria, leaving there only a garrison of 300 men; of which *Thmail*, the khalif's admiral, being apprised, he in a few days appeared before the town, and carried off the remainder of the inhabitants to an island in the Nile called *Abukair*. This was done, to prevent Abul Kâsem from meeting with any entertainment at Alexandria, in case he should think proper to return. According to Euty chius, above

Alexandria. 200,000 of the miserable inhabitants perished this year.

What contributed to raise Alexandria to such a prodigious height of splendor as it enjoyed for a long time, was its being the centre of commerce between the eastern and western parts of the world. It was with the view of becoming master of this lucrative trade, that Alexander built this city, after having extirpated the Tyrians, who formerly engrossed all the East-India traffic. Of the immense riches which that trade afforded, we may form an idea, from considering that the Romans accounted it a point of policy to oppress the Egyptians, especially the Alexandrians; and after the defeat of Zenobia, there was a single merchant of Alexandria who undertook to raise and pay an army out of the profits of his trade. The Greek emperors drew prodigious tributes from Egypt, and yet the khalifs found their subjects in so good circumstances as to screw up their revenues to three hundred millions of crowns.

Though the revolutions which happened in the government of Egypt, after it fell into the hands of the Mahometans, frequently affected this city to a very great degree; yet still the excellence of its port, and the innumerable conveniences resulting from the East-India trade, to whomsoever were masters of Egypt, preserved Alexandria from total destruction, even when in the hands of the most barbarous nations. Thus, in the 13th century, when the barbarism introduced by the Goths, &c. began to wear off from the European nations, and they acquired a taste for the elegancies of life, the old mart of Alexandria began to revive; and the port, though far from recovering its former magnificence, grew once more famous by becoming the centre of commerce: but having fallen under the dominion of the Turks, and the passage round the Cape of Good Hope being discovered by the Portuguese in 1499, a fatal blow was given to the Alexandrian commerce, and the city has since fallen into decay.

At present, the city of Alexandria is reckoned to have about 14,000 or 15,000 inhabitants; a strange collieries of different nations, as well as from various parts of the Turkish empire. They are in general given to thieving and cheating; and (like their predecessors) seditious above all others, were they not kept in awe by the severity of their government. The British and French carry on a considerable commerce with them, and have each a consul residing here. Some Venetian ships also sail thither yearly, but with French colours, and under the protection of France. The subjects of those kingdoms which keep no consul here, are subjected to a tax by the Grand Signior: but the Jews have found out a method of indemnifying themselves for this disadvantage; namely, by selling their commodities cheaper than other foreigners can afford. They are also favoured by the farmers of the revenue; who know, that if they do not pay some private regard to them, the Jews have it in their power to cause fewer merchandizes come into their port during the two years that their farm lasts.

The present city is a kind of peninsula situated between the two ports. That to the westward was called by the ancients the *Portus Eunossus*, now the *Old Port*, and is by far the best; Turkish vessels only are allowed to anchor there: the other, called the *New Port*, is for the Christians; at the extremity of one of the arms of which stood the famous Pharos. The New Port,

N^o 10.

the only harbour for the Europeans, is clogged up with sand, infomuch that in stormy weather ships are liable to bilge; and the bottom being also rocky, the cables soon chafe and part; so that one vessel driving against a second, and that against a third, they are perhaps all lost. Of this there was a fatal instance 16 or 18 years ago, when 42 vessels were dashed to pieces on the mole in a gale of wind from the north-west, and numbers have been since lost there at different times. If it be asked in Europe, Why do they not repair the New Port? the answer is, That in Turkey they destroy every thing, and repair nothing. The old harbour will be destroyed likewise, as the ballast of vessels has been continually thrown into it for the last 200 years. The spirit of the Turkish government is to ruin the labours of past ages, and destroy the hopes of future times, because the barbarity of ignorant despotism never considers to-morrow.

In time of war, Alexandria is of no importance; no fortification is to be seen; even the Farillon, with its lofty towers, cannot be defended. It has not four cannon fit for service, nor a gunner who knows how to point them. The 500 janisaries, who should form the garrison, reduced to half that number, know nothing but how to smoke a pipe. But Alexandria is a place of which the conquest would be of no value. A foreign power could not maintain itself there, as the country is without water. This must be brought from the Nile by the kalidj, or canal of 12 leagues, which conveys it thither every year at the time of the inundation. It fills the vaults or reservoirs dug under the ancient city, and this provision must serve till the next year. It is evident, therefore, that were a foreign power to take possession, the canal would be shut, and all supplies of water cut off. It is this canal alone which connects Alexandria with Egypt; for from its situation without the Delta, and the nature of the soil, it really belongs to the deserts of Africa. Its environs are sandy, flat, and sterile, without trees and without houses; where we meet with nothing but the plant which yields the kali, and a row of palm trees which follows the course of the kalidj or canal.

The city is governed like others in the same kingdom. (See EGYPT.) It hath a small garrison of soldiers, part of which are Janisaries and Assassins; who are very haughty and insolent, not only to strangers, but to the mercantile and industrious part of the people, tho' ever so considerable and useful. The government is so remiss in favour of these wretches, that Mr Norden informs us, one of them did not hesitate to kill a farmer of the customs, for refusing to take less of him than the duty imposed, and went off unpunished; it being a common salvo among them, that what is done cannot be undone.

The present condition of Alexandria is very despicable, being now so far ruined, that the rubbish in many places overtops the houses. The famous tower of Pharos has long since been demolished, and a castle, called *Farillon*, built in its place. The causeway which joined the island to the continent is broken down, and its place supplied by a stone-bridge of several arches.

Some parts of the old walls of the city are yet standing, and present us with a masterpiece of ancient masonry. They are flanked with large towers, about 200 paces distant from each other, with small ones in the middle.

Alexandria. middle. Below are magnificent cafemates, which may serve for galleries to walk in. In the lower part of the towers is a large fquare hall, whose roof is fupported by thick columns of Thebaic ftone. Above this are feveral rooms, over which there are platforms more than 20 paces fquare. The ancient refervoirs, vaulted with fo much art, which extend under the whole town, are almoft entire at the end of 2000 years.

Of Cæfar's palace there remain only a few porphyry pillars, and the front, which is almoft entire, and looks very beautiful. The palace of Cleopatra was built upon the walls facing the port, having a gallery on the outside, fupported by feveral fine columns. Not far from this palace are two obelifks vulgarly called *Cleopatra's Needles*. They are of Thebaic ftone, and covered with hieroglyphics. One is overturned, broken, and lying under the fand; the other is on its pedeftal. Thefe two obelifks, each of them of a fingle ftone, are about 60 feet high, by feven foot fquare at the bafe. Towards the gate of Rofetta, are five columns of marble on the place formerly occupied by the porticoes of the Gymnafium. The reft of the colonnade, the defign of which was difcoverable 100 years ago by Maillet, has fince been deftroyed by the barbarifm of the Turks.

But what moft engages the attention of travellers is the Pillar of Pompey, as it is commonly called, fituated at a quarter of a league from the fouthern gate. It is compofed of red granite. The capital is Corinthian, with palm leaves, and not indented. It is nine feet high. The fhaft and the upper member of the bafe are of one piece of 90 feet long, and 9 in diameter. The bafe is a fquare of about 15 feet on each fide. This block of marble, 60 feet in circumference, refts on two layers of ftone bound together with lead; which, however, has not prevented the Arabs from forcing out feveral of them, to fearch for an imaginary treafure. The whole column is 114 feet high. It is perfectly well polifhed, and only a little fhivered on the eastern fide. Nothing can equal the majefty of this monument; feen from a diftance, it overtops the town, and ferves as a fignal for veffels. Approaching it nearer, it produces an aftonifhment mixed with awe. One can never be tired with admiring the beauty of the capital, the length of the fhaft, nor the extraordinary fimplicity of the pedeftal. This laft has been fomewhat damaged by the inftruments of travellers, who are curious to poffefs a relick of this antiquity; and one of the volutes of the column was immaturely brought down about twelve years ago, by a prank of fome English captains, which is thus related by Mr Irwin.

Thefe jolly fons of Neptune had been pushing about the can on board one of the fhips in the harbour, until a ftrange freak entered into one of their brains. The eccentricity of the thought occafioned it immediately to be adopted; and its apparent impoffibility was but a fpur for the putting it into execution. The boat was ordered; and with proper implements for the attempt, thefe enterprifing heroes pushed afhore, to drink a bowl of punch on the top of Pompey's pillar! At the fpot they arrived; and many contrivances were propofed to accomplifh the defired point. But their labour was vain; and they began to defpair of fuccefs, when the genius who ftruck out the frolic happily fug-

gected the means of performing it. A man was difpatched to the city for a paper kite. The inhabitants were by this time apprized of what was going forward, and flocked in crowds to be witneffes of the addrefs and boldnefs of the Englifh. The governor of Alexandria was told that thefe feamen were about to pull down Pompey's pillar. But whether he gave them credit for their refpect to the Roman warrior, or to the Turkish government, he left them to themfelves; and politely answered, that the Englifh were too great patriots to injure the remains of Pompey. He knew little, however, of the difpofition of the people who were engaged in this undertaking. Had the Turkish empire rofe in oppofition, it would not perhaps at that moment have deterred them. The kite was brought, and flown fo directly over the pillar, that when it fell on the other fide, the ftring lodged upon the capital. The chief obftacle was now overcome. A two-inch rope was tied to one end of the ftring, and drawn over the pillar by the end to which the kite was affixed. By this rope one of the feamen afcended to the top; and in lefs than an hour, a kind of fhroud was conftituted, by which the whole company went up, and drank their punch amid the fhouts of the aftonifhed multitude. To the eye below, the capital of the pillar does not appear capable of holding more than one man upon it; but our feamen found it could contain no lefs than eight perfons very conveniently. It is aftonifhing that no accident befel thefe madcaps, in a fituation fo elevated, that would have turned a landman giddy in his fober fenfes. The only detriment which the pillar received, was the lofs of the volute beforementioned; which came down with a thunder found, and was carried to England by one of the captains, as a prefent to a lady who commiffioned him for a piece of the pillar. The difcovery which they made amply compenfated for this mifchief; as without their evidence, the world would not have known at this hour, that there was originally a ftatue on this pillar, one foot and ancle of which are ftill remaining. The ftatue muft have been of a gigantic fize, to have appeared of a man's proportion at fo great an height.

There are circumftances in this ftory which might give it an air of fiction, were it not demonftrated beyond all doubt. Befides the teftimonies of many eye-witneffes, the adventurers themfelves have left us a token of the fact, by the initials of their names, which are very legible in black paint juft beneath the capital.

Learned men and travellers have made many fruitlefs attempts to difcover in honour of what prince it was erected. The beft informed have concluded, that it could not be in honour of Pompey, fince neither Strabo nor Diodorus Siculus have fpoken of it. The Arabian Abulfeda, in his defcription of Egypt, calls it *the Pillar of Severus*. And hiftory informs us, that this emperor "vifited the city of Alexandria: That he granted a fenate to its inhabitants, who until that time, under the fubjection of a fingle Roman magiftrate, had lived without any national council, as under the reign of the Ptolemies, when the will of the prince was their only law: That he did not confine his benefactions there; he changed feveral laws in their favour." This column, therefore, Mr Savary concludes to have been erected by the inhabitants as a mark of their gratitude to Severus. And in a Greek infcrip-

^{Alexandria.}tion, now half effaced, but visible on the west side when the sun shines upon it, and which probably was legible in the time of Abulfeda, he supposes the name of Severus to have been preserved. He further observes, that this was not the only monument erected to him by the gratitude of the Alexandrians: for there is still seen in the midst of the ruins of Antinoe, built by Adrian, a magnificent pillar, the inscription on which is still remaining, dedicated to Alexander Severus.

On the south-west side of the city, at a mile's distance, are situated the catacombs, the ancient burial-place of Alexandria; and although they cannot be compared to those of the ancient Memphis, which the Arabs will not permit to be visited, in order to make the better market of their mummies, it is probable that, the method of embalming being the same, the form of these catacombs can only differ in their proportions.—The Baron de Tott, in describing these, observes, “that Nature not having furnished this part of Egypt with a ridge of rocks, like that which runs parallel with the Nile above Delta, the ancient inhabitants of Alexandria could only have an imitation by digging into a bed of solid rock; and thus they formed Necropolis, or ‘City of the Dead.’ The excavation is from 30 to 40 feet wide, and 200 long and 25 deep, and is terminated by gentle declivities at each end. The two sides, cut perpendicularly, contain several openings, about 10 or 12 feet in width and height, hollowed horizontally; and which form, by their different branches, subterranean streets. One of these, which curiosity has disencumbered from the ruins and sands that render the entrance of others difficult or impossible, contains no mummies, but only the places they occupied. The order in which they were ranged is still to be seen. Niches, 20 inches square, sunk six feet horizontally, narrowed at the bottom, and separated from each other by partitions in the rock, seven or eight inches thick, divide into checkers the two walls of this subterranean vault. It is natural to suppose, from this disposition, that each mummy was introduced with the feet foremost into the cell intended for its reception; and that new streets were opened, in proportion as these dead inhabitants of Necropolis increased.” This observation, he adds, which throws a light on the catacombs of Memphis, may perhaps likewise explain the vast size and multitude, as well as the different elevations, of the pyramids in the Higher and Lower Egypt.

About 70 paces from Pompey's pillar is the khalis, or the canal of the Nile, which was dug by the ancient Egyptians, to convey the water of the Nile to Alexandria, and fill the cisterns under the city. On the side of the khalis are gardens full of orange and lemon trees, and the fields are full of caper and palm trees. On the top of a hill is a tower, on which a centinel is always placed, to give notice, by means of a flag, of the ships that are coming into the port. From this hill may be seen the sea, the whole extent of the city, and the parts round it.

In going along the sea-coast, there is a large bason cut out of the rock that lines the shore. On the sides of this bason, two beautiful saloons are hewn out by the chisel, with benches that run across them. A canal made zig-zag, for the purpose of stopping the sand by its different windings, conveys into them the

water of the sea, as pure and transparent as crystal. Seated on the stone bench, the water rises a little above the waist; while the feet softly repose on a fine sand. The waves of the sea are heard roaring against the rock, and foaming in the canal. The swell enters, raises you up, and leaves you; and thus alternately entering and retiring, brings a continual fresh supply of water, and a coolness which is truly delicious under a burning sky. This place is vulgarly called the *Bath of Cleopatra*. Some ruins announce that it was formerly ornamented.

Alexandria is about 50 leagues north of Cairo. E. Long. 31. 15. N. Lat. 31. 12.

ALEXANDRIA, a strong and considerable city of Italy, belonging to the Duchy of Milan, with a good castle, built in 1178 in honour of Pope Alexander III. This pope made it a bishopric, with several privileges and exemptions. Prince Eugene of Savoy took this city in 1706, after three days siege. The French took it in 1745; but the king of Sardinia, to whom it belongs by the treaty of Utrecht, retook it in 1746. The fortifications of the town are trifling, but the citadel is considerable. It is 15 miles south-east of Cassal, 35 north-by-west of Genoa, and 40 south-by-west of Milan. E. Long. 8. 40. N. Lat. 44. 53. The country about this town is called the *Alexandrin*.

ALEXANDRIA (anc. geog.), a city of Arachosia, called also *Alexandropolis*, on the river Arachotus (Stephanus, Isidorus Characenus).—Another *Alexandria* in Gedrosia, built by Leonatus, by order of Alexander (Pliny).—A third *Alexandria* in Aria, situated at the lake Arias (Ptolemy); but, according to Pliny, built by Alexander on the river Arius.—A fourth in the Bactriana (Pliny).—A fifth *Alexandria*, an inland town of Carmania (Pliny, Ptolemy, Ammian).—A sixth *Alexandria*, or *Alexandropolis*, in the Sogdiana (Isidorus Characenus).—A seventh in India, at the confluence of the Accfines and Indus (Arrian).—An eighth, called also *Alexandretta*, near the Sinus Issicus, on the confines of Syria and Cilicia, now *Scanderoon* (see ALEXANDRETTA), the port-town to Aleppo.—A ninth *Alexandria* of Margiana, which being demolished by the barbarians, was rebuilt by Antiochus the son of Seleucus, and called *Antiochia* of Syria (Pliny); watered by the river Margus, which is divided into several channels, for the purposes of watering the country, which was called *Zotale*. The city was seventy stadia in circuit, according to Pliny; who adds, that, after the defeat of Crassus, the captives were conveyed to this place by Orodes, the king of the Parthians.—A tenth, of the Oxiana, built on the Oxus by Alexander, on the confines of Bactria (Pliny).—An eleventh, built by Alexander at the foot of mount Paropamisus, which was called *Caucasus* (Pliny, Arrian).—A twelfth *Alexandria* in Troas, called also *Troas* and *Antigonis* (Pliny).—A thirteenth on the Iaxartes, the boundary of Alexander's victories towards Scythia, and the last that he built on that side.

ALEXANDRIAN, in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria. In this sense, Clemens is denominated *Alexandrinus*, though born at Athens. The same may be said of Apion, who was born at Oasis; and Arostarchus, by birth a Samothracian. The chief Alexandrian philosophers were, Amonius, Plotinus,

^{Alexandria.}
^{Alexandri-}
^{an.}

Alexandri-
an
||
Alexis.

tinus, Origen, Porphyry, Jamblicus, Sopater, Maximus, and Dexippus.

ALEXANDRIAN is more particularly understood of a college of priests, consecrated to the service of Alexander Severus after his deification. Lampridius relates, that, notwithstanding Severus was killed by Maximin, the senate prosecuted his apotheosis; and, for regularity of worship, founded an order of priests, or *sodales*, under the denomination of *Alexandrini*.

ALEXANDRIAN Library. See p. 389, *supra*.

ALEXANDRIAN Manuscript, a famous copy of the Scriptures, consisting of four volumes, in a large quarto size; which contains the whole Bible in Greek, including the Old and New Testament, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum. It was sent as a present to King Charles I. from Cyrillus Lucaris, patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the Grand Signior, about the year 1628. Cyrillus brought it with him from Alexandria, where probably it was written. In a schedule annexed to it, he gives this account: That it was written, as tradition informed them, by Thecla, a noble Egyptian lady, about 1300 years ago, not long after the council of Nice. But this high antiquity, and the authority of the tradition to which the patriarch refers, have been disputed; nor are the most accurate biblical writers agreed about its age. Grabe thinks that it might have been written before the end of the fourth century; others are of opinion, that it was not writ till near the end of the fifth century, or somewhat later.

ALEXANDRIAN, or *Alexandrine*, in poetry, a kind of verse consisting of twelve, or of twelve and thirteen syllables alternately; so called from a poem on the life of Alexander, written in this kind of verse by some French poet. Alexandrines are peculiar to modern poetry, and seem well adapted to epic poems. They are sometimes used by most nations of Europe; but chiefly by the French, whose tragedies are generally composed of Alexandrines.

ALEXICACUS, something that preserves the body from harm or mischief. The word amounts to much the same as *alexiterial*.

ALEXICACUS, in antiquity, was an attribute of Neptune, whom the tunny-fishers used to invoke under this appellation, that their nets might be preserved from the *lysiæ*, or sword-fish, which used to tear them; and that he might prevent the assistance which it was pretended the dolphins used to give the tunnies on this occasion.

ALEXIPHARMICS, in medicine, are properly remedies for expelling or preventing the ill effects of poison: but some of the moderns having imagined, that the animal spirits, in acute distempers, were affected by a malignant poison, the term has been understood to mean medicines adapted to expel this poison by the cutaneous pores, in the form of sweat. In this sense, alexipharmics are the same as sudorifics.

ALEXIS, a Piedmontese. There is a book of "Secrets," which for a long time has gone under his name. It was printed at Basil 1536, in 8vo, and translated from Italian into Latin by Wecher; it has also been translated into French, and printed several times with additions. There is a preface to the piece, wherein Alexis informs us, that he was born of a noble

family; that he had from his most early years applied himself to study; that he had learned the Greek, the Latin, the Hebrew, the Chaldean, the Arabian, and several other languages; that having an extreme curiosity to be acquainted with the secrets of nature, he had collected as much as he could during his travels for 57 years; that he piqued himself upon not communicating his secrets to any person; but that when he was 82 years of age, having seen a poor man who had died of a sickness which might have been cured had he communicated his secret to the surgeon who took care of him, he was touched with such a remorse of conscience, that he lived almost like a hermit: and it was in this solitude that he ranged his secrets in such an order as to make them fit to be published. The hawkers generally carry them, with other books, to the country fairs. These, however, contain only the select remedies of Signor Alexis of Piedmont; the entire collection would make too large a volume for them.

ALEXITERIAL, among physicians, a term of much the same import with *alexipharmic*; though sometimes used in a synonymous sense with amulet.

ALEYN (Charles), an English poet in the reign of Charles I. In 1631, he published two poems on the famous victories of Cressy and Poitiers. He succeeded his father as clerk of the ordnance, and was commissary-general of the artillery to the king at the battle of Edgehill. The next piece he wrote was a poem in honour of Henry VII. and the victory that gained him the crown of England. In 1639, the year before he died, he translated the history of Eurialius and Lucretia, from the Latin epistles of Æneas Sylvius.

ALFANDIGA, the name of the customhouse at Lisbon.

ALFAQUES, among the Moors, the name generally used for their clergy, or those who teach the Mahometan religion; in opposition to the Morabites, who answer to monks among Christians.

ALFATERNA (anc. geog.), the last town of Campania, beyond Vesuvius (Diodorus); the same with *Nocera*, which see. The inhabitants *Alfaterni* (Pliny).

ALFDOUCH, a name given by the Moors to a sort of vermicelli, which they make of flour and water, and are very fond of in their entertainments.

ALFET, in our old customs, denotes a caldron full of boiling water, wherein an accused person, by way of trial or purgation, plunged his arm up to the elbow.

ALFORD, a town in Lincolnshire, with a market on Tuesdays for provisions and corn; and two fairs, on Whit-Tuesday, and November 8. for cattle and sheep. It is seated on a small brook that runs through the town, and is a compact place. A salt spring was discovered here in 1670, from the pigeons which flew thither in great numbers to drink the water; those birds being known to be fond of salt. It contains a purging salt, together with a portion of sea-salt. It is strongly purgative. It is recommended as cooling, cleansing, and attenuating. As a good remedy in the scurvy, jaundice, and other glandular obstructions. It also promotes urine and sweat, and therefore is good in gravelly and other disorders of the kidneys and bladder; and in complaints arising from obstructed perspiration. Alford is six miles from the sea, and 20 N. of Boston. E. Long. o. 15. N. Lat. 53. 30.

Alfred.

ALFRED, or ÆLFRED, the Great, king of England, was the fifth and youngest son of Æthelwolf king of the West Saxons, and was born at Wantage in Berkshire in 849. He distinguished himself, during the reign of his brother Ethelred, in several engagements against the Danes; and upon his death succeeded to the crown, in the year 871, and the 22d of his age. At his ascending the throne he found himself involved in a dangerous war with the Danes, and placed in such circumstances of distress as called for the greatest valour, resolution, and all the other virtues with which he was adorned. The Danes had already penetrated into the heart of his kingdom; and before he had been a month upon the throne, he was obliged to take the field against those formidable enemies. After many battles gained on both sides, he was at length reduced to the greatest distress, and was entirely abandoned by his subjects. In this situation, Alfred, conceiving himself no longer a king, laid aside all marks of royalty, and took shelter in the house of one who kept his cattle. He retired afterwards to the isle of Æthelingey in Somersetshire, where he built a fort for the security of himself, his family, and the few faithful servants who repaired thither to him. When he had been about a year in this retreat, having been informed that some of his subjects had routed a great army of the Danes, killed their chiefs, and taken their magical standard (A), he issued his letters, giving notice where he was, and inviting his nobility to come and consult with him. Before they came to a final determination, Alfred, putting on the habit of a harper, went into the enemy's camp, where, without suspicion, he was every where admitted, and had the honour to play before their princes. Having thereby acquired an exact knowledge of their situation, he returned in great secrecy to his nobility, whom he ordered to their respective homes, there to draw together each man as great a force as he could; and upon a day appointed there was to be a general rendezvous at the great wood, called *Selwood*, in Wiltshire. This affair was transacted so secretly and expeditiously, that, in a little time, the king, at the head of an army, approached the Danes, before they had the least intelligence of his design. Alfred, taking advantage of the surprise and terror they were in, fell upon them, and totally defeated them at Æthendune, now Eddington. Those who escaped fled to a neighbouring castle, where they were soon besieged, and obliged to surrender at discretion.

Alfred granted them better terms than they could expect. He agreed to give up the whole kingdom of the East-Angles to such as would embrace the Christian religion, on condition they should oblige the rest of their countrymen to quit the island, and, as much as it was in their power, prevent the landing of any more foreigners. For the performance thereof he took hostages; and when, in pursuance of the treaty, Guthrum the Danish captain came, with thirty of his chief officers, to be baptized, Alfred answered for him at the font, and gave him the name of *Æthelstans*; and certain laws were drawn up betwixt the king and Guthrum for the regulation and government of the Danes settled in England. In 884, a fresh number of Danes landed in Kent, and laid siege to Rochester; but the king coming to the relief of that city, they were obliged to abandon their design. Alfred had now great success; which was chiefly owing to his fleet, an advantage of his own creating. Having secured the sea-coasts, he fortified the rest of the kingdom with castles and walled towns; and he besieged and recovered from the Danes the city of London, which he resolved to repair, and keep as a frontier (B).

After some years respite, Alfred was again called into the field: for a body of Danes, being worsted in the west of France, came with a fleet of 250 sail on the coast of Kent; and having landed, fixed themselves at Apple-tree: shortly after, another fleet of 80 vessels coming up the Thames, the men landed, and built a fort at Middleton. Before Alfred marched against the enemy, he obliged the Danes, settled in Northumberland and Essex, to give him hostages for their good behaviour. He then moved towards the invaders, and pitched his camp between their armies, to prevent their junction. A great body, however, moved off to Essex; and crossing the river, came to Farnham in Surry, where they were defeated by the king's forces. Mean while the Danes settled in Northumberland, in breach of treaty, and notwithstanding the hostages given, equipped two fleets; and, after plundering the northern and southern coasts, sailed to Exeter, and besieged it. The king, as soon as he received intelligence, marched against them; but before he reached Exeter, they had got possession of it. He kept them, however, blocked up on all sides; and reduced them at last to such extremities, that they were obliged to eat their horses, and were even ready to devour each other. Being at length rendered desperate, they made a general sally on the besiegers;

Alfred.

(A) "This (says Sir John Spelman) was a banner with the image of a raven magically wrought by the three sisters of Hinguar and Hubba, on purpose for their expedition, in revenge of their father Lodebroch's murder, made, they say, almost in an instant, being by them at once begun and finished in a noontide, and believed by the Danes to have carried great fatality with it, for which it was highly esteemed by them. It is pretended, that being carried in battle, towards good success it would always seem to clap its wings, and make as if it would fly; but towards the approach of mishap, it would hang down and not move." *Life of Alfred*, p. 61.

(B) The Danes had possessed themselves of London in the time of his father; and had held it till now as a convenient place for them to land at, and fortify themselves in; neither was it taken from them but by a close siege. However, when it came into the king's hands, it was in a miserable condition, scarce habitable, and all its fortifications ruined. The king, moved by the importance of the place, and the desire of strengthening his frontier against the Danes, restored it to its ancient splendor. And observing, that, through the confusion of the times, many, both Saxons and Danes, lived in a loose disorderly manner, without owning any government, he offered them now a comfortable establishment, if they would submit and become his subjects. This proposition was better received than he expected; for multitudes growing weary of a vagabond kind of life, joyfully accepted such an offer. *Chron. Sax.* p. 88.

Alfred. siegers; but were defeated, though with great loss on the king's side. The remainder of this body of Danes fled into Essex, to the fort they had built there, and to their ships. Before Alfred had time to recruit himself, another Danish leader, whose name was Laf, came with a great army out of Northumberland, and destroyed all before him, marching on to the city of Werheal in the west, which is supposed to be Chester, where they remained the rest of that year. The year following they invaded North-Wales; and after having plundered and destroyed every thing, they divided, one body returning to Northumberland, another into the territories of the East-Angles; from whence they proceeded to Essex, and took possession of a small island called *Merefig*. Here they did not long remain: for having parted, some sailed up the river Thames, and others up the Lea-road; where drawing up their ships, they built a fort not far from London, which proved a great check upon the citizens, who went in a body and attacked it, but were repulsed with great loss: at harvest-time the king himself was obliged to encamp with a body of troops in the neighbourhood of the city, in order to cover the reapers from the excursions of the Danes. As he was one day riding by the side of the river Lea, after some observation, he began to think that the Danish ships might be laid quite dry: this he attempted, and succeeded; so that the Danes deserted their fort and ships, and marched away to the banks of the Severn, where they built a fort, and wintered at a place called *Quatbrig* (c). Such of the Danish ships as could be got off, the Londoners carried into their own road; the rest they burnt and destroyed.

Alfred enjoyed a profound peace during the three last years of his reign, which he chiefly employed in establishing and regulating his government, for the security of himself and his successors, as well as the ease and benefit of his subjects in general. After a troublesome reign of 28 years, he died on the 28th of October A. D. 900; and was buried at Winchester, in Hyde-abbey, under a monument of porphyry.

All our historians agree in distinguishing him as one of the most valiant, wisest, and best of kings that ever reigned in England; and it is also generally allowed, that he not only digested several particular laws still in being, but that he laid the first foundation of our present happy constitution. There is great reason to believe that we are indebted to this prince for trials by juries; and the doom-day-book, which is preserved in the exchequer, is thought to be no more than another edition of Alfred's book of Winchester, which contained a survey of the kingdom. It is said also, that he was the first who divided the kingdom into shires: what is ascribed to him is not a bare division of the country, but the settling a new form of judicature; for after having divided his dominions into shires, he subdivided each shire into three parts, called *trythings*. There are some remains of this ancient division in the ridings of Yorkshire, the laths of Kent, and the three

parts of Lincolnshire. Each trything was divided into hundreds or wapentakes; and these again into tythings or dwellings of ten householders: each of these householders stood engaged to the king, as a pledge for the good behaviour of his family, and all the ten were mutually pledges for each other; so that if any one of the tything was suspected of an offence, if the head boroughs or chiefs of the tything would not be security for him, he was imprisoned; and if he made his escape, the tything and hundred were fined to the king. Each shire was under the government of an earl, under whom was the reive, his deputy; since, from his office, called *shire-reive*, or *sheriff*. And so effectual were these regulations, that it is said he caused bracelets of gold to be hung up in the highways, as a challenge to robbers, and they remained untouched.

In private life, Alfred was the most amiable man in his dominions; of so equal a temper, that he never suffered either sadness or unbecoming gaiety to enter his mind; but appeared always of a calm, yet cheerful disposition, familiar to his friends, just even to his enemies, kind and tender to all. He was a remarkable economist of his time, and Afferius has given us an account of the method he took for dividing and keeping an account of it: he caused six wax-candles to be made, each of 12 inches long, and of as many ounces weight; on the candles the inches were regularly marked, and having found that one of them burnt just four hours, he committed them to the care of the keepers of his chapel, who from time to time gave him notice how the hours went: but as in windy weather the candles were wasted by the impression of the air on the flame, to remedy this inconvenience, he invented lanterns, there being then no glass in his dominions.

This prince, we are told, was 12 years of age before a master could be procured in the western kingdom to teach him the alphabet; such was the state of learning when Alfred began to reign. He had felt the misery of ignorance; and determined even to rival his contemporary Charlemagne in the encouragement of literature. He is supposed to have appointed persons to read lectures at Oxford, and is thence considered as the founder of that university. By other proper establishments, and by a general encouragement to men of abilities, he did every thing in his power to diffuse knowledge throughout his dominions. Nor was this end promoted more by his countenance and encouragement than by his own example and his writings. For notwithstanding the lateness of his initiation, he had acquired extraordinary erudition; and, had he not been illustrious as a king, he would have been famous as an author. His works are, 1. *Breviarum quoddam collectum ex Legibus Trojanorum*, &c. lib. I. A Breviary collected out of the Laws of the Trojans, Greeks, Britons, Saxons, and Danes, in one Book. Leland saw this book in the Saxon tongue, at Christ-church in Hampshire. 2. *Vifi-Saxonum Leges*, lib. I. The laws of the West-Saxons, in one book. Pitts tells us, that it is in Ben-

Alfred.

(c) The king's contrivance is thought to have produced the meadow between Hertford and Bow; for at Hertford was the Danish fort, and from thence they made frequent excursions on the inhabitants of London. Authors are not agreed as to the method the king pursued in laying dry the Danish ships: Dugdale supposes that he did it by straitening the channel; but Henry of Huntingdon alleges, that he cut several canals, which exhausted its water.

Alfred
||
Algebra.

net-College library, at Cambridge. 3. *Instituta quedam*, lib. 1. Certain Institutes, in one book. This is mentioned by Pitts, and seems to be the second capitulation with Guthrum. 4. *Contra judices iniquos*, lib. I. An Inveſtive againſt Unjuſt Judges, in one book. 5. *Acta Magistratum ſuorum*, lib. I. Acts of his Magiſtrates, in one book. This is ſuppoſed to be the book of judgments mentioned by Horne; and was, in all probability, a kind of reports, intended for the uſe of ſucceeding ages. 6. *Regum fortuna varia*, lib. I. The various Fortunes of Kings, in one book. 7. *Dicta ſapientum*, lib. I. The Sayings of Wiſe Men, in one book. 8. *Parobole et ſales*, lib. I. Parables and pleaſant Sayings, in one book. 9. *Collectiones chroni-corum*. Collections of Chronicles. 10. *Epistoła ad Wulfſigium Episcopum*, lib. I. Epistles to Biſhop Wulfſig, in one book. 11. *Manuale meditationum*. A Manual of Meditations.—Beſides theſe original works, he tranſlated many authors from the Latin, &c. into the Saxon language, viz. 1. Bede's History of England, 2. Paulinus Oroſinus's History of the Pagans. 3. St Gregory's Pastoral, &c. The firſt of theſe, with his prefaces to the others, together with his laws, were printed at Cambridge, 1644. His laws are likewiſe inſerted in Spelman's Councils. 4. *Boethius de Conſolatione*, lib. V. Boetius's Conſolations of Philoſophy, in five books. Dr Plot tells us, king Alfred tranſlated it at Woodſtock, as he found in a MS. in the Cotton Library. 5. *Æſopi fabule*, Æſop's Fables: which he is ſaid to have tranſlated from the Greek both into Latin and Saxon. 6. *Pſalterium Davidicum*, lib. I. David's Pſalter, in one book. This was the laſt work the King attempted, death ſurpriſing him before he had finiſhed it; it was however completed by another hand, and publiſhed at London in 1640, in quarto, by Sir John Spelman. Several others are mentioned by Malmsbury; and the old hiſtory of Ely aſſerts, that he tranſlated the Old and New Testaments.

The life of this great king was firſt written by Aſferius Menevenſis; and firſt publiſhed by Archbiſhop Parker, in the old Saxon character, at the end of his edition of Haſſingham's hiſtory, printed in 1674, fol.

ALGA, in botany, the trivial name of the lichen, fucus, and ſeveral other plants of the cryptogamia claſs.

ALGÆ, FLAGS; one of the ſeven families or natural tribes into which the whole vegetable kingdom is divided by Linnæus, in his *Philoſophia Botanica*. They are deſigned to be plants, whoſe root, leaf, and ſtem are

all one. Under this deſcription are comprehended all the ſea-weeds, and ſome other aquatic plants. In the ſexual ſyſtem, they conſtitute the 3d order of the 24th claſs *Cryptogamia*; in Tournefort, the ſecond genus of the ſecond ſection, *Marine, aut fluviatiles*, of the 17th claſs, *Aſperma vulgo habitæ*; and the 57th order in Linnæus's Fragments of a Natural Method. The diſcoveries made in this part of the vegetable kingdom are uncertain, and imperfected; and the attempts, in particular, to arrange flags by the parts of the fructification, have not been attended with great ſucceſs. Dillenius has arranged this order of plants from their general habit and ſtructure; Michelius from the parts of fructification.—Each has conſiderable merit.

ALGAGIOLA, a ſmall ſea-port town in the iſland of Corſica, fortified with walls and baſtions. It was almoſt deſtroyed by the malcontents in 1731, but has ſince been repaired. E. Long. 9. 45. N. Lat. 42. 20.

ALGAROT, in chemiſtry, an Arabic term for an emetic powder, prepared from regulus of antimony, diſſolved in acids, and ſeparated by repeated lotions in warm water.

ALGAROTTI (Count), a celebrated Italian, was born at Padua; but the year is not mentioned. Led by curioſity, as well as a deſire of improvement, he travelled early into foreign countries; and was very young when he arrived in France in 1736. Here he compoſed his “Newtonian Philoſophy for the Ladies;” as Fontenelle had done his Cartesian Aſtronomy, in the work intitled, “The Plurality of worlds.” He was noticed by the king of Pruffia, who gave him marks of the eſteem he had for him. He died at Piſa the 23d of May, 1764; and ordered his own maſoleum, with this inſcription to be fixed upon it: “Hic jacet Alga-“rottus, ſed non omnis.” He is allowed to have been a very great connoiſſeur in painting, ſculpture, and architecture. He contributed much to the reformation of the Italian opera. His works, which are numerous, and upon a variety of ſubjects, abound with vivacity, elegance, and wit: a collection of them has lately been made, and printed at Leghorn.

ALGARVA, a province in the kingdom of Portugal, 67 miles in length and 20 in breadth; bounded on the W. and S. by the ſea, on the E. by the river Guadiana, and on the N. by Alentejo. It is very fertile in figs, almonds, dates, olives, and excellent wines; beſides, the fiſhery brings in large ſums. The capital town is Pharos. It contains four cities, 12 towns, 67 pariſhes, and 61,000 inhabitants.

A L G E B R A,

Definition
and etymo-
logy.

A GENERAL method of computation, wherein ſigns and ſymbols, commonly the letters of the alphabet, are made uſe of to repreſent numbers, or any other quantities.

This ſcience, properly ſpeaking, is no other than a kind of ſhort-hand, or ready way of writing down a chain of mathematical reaſoning on any ſubject whatever; ſo that it is applicable to arithmetic, geometry, aſtronomy, meſuration of all kinds of ſolids, &c. and the great advantages derived from it appear manifeſtly to ariſe from the conciſeneſs and perſpicuity with which

every propoſition on mathematical ſubjects can be written down in algebraic characters, greatly ſuperior to the tedious circumlocutions which would be neceſſary were the reaſoning to be written in words at length.

With regard to the etymology of the word *algebra*, it is much conteſted by the critics. Menage derives it from the Arabic *aljabarat*, which ſignifies the reſtitution of any thing broken; ſuppoſing that the principal part of algebra is the conſideration of broken numbers. Others rather borrow it from the Spaniſh, *algebrista*, a perſon who replaces diſlocated bones; adding,

Algagiola
||
Algebra

History.

ding, that algebra has nothing to do with fraction. Some, with M. d'Herbelot, are of opinion, that algebra takes its name from Gebar, a celebrated philosopher, chemist, and mathematician, whom the Arabs call Giaber, and who is supposed to have been the inventor. Others from *gefi*, a kind of parchment made of the skin of a camel, whereon Ali and Giafer Sadek wrote, in mystic characters, the fate of Mahometanism, and the grand events that were to happen till the end of the world. But others, with more probability, derive it from *geber*; a word whence, by prefixing the article *al*, we have formed *algebra*; which is pure Arabic, and properly signifies the reduction of fractions to a whole number. However, the Arabs, it is to be observed, never use the word *algebra* alone, to express what we mean by it; but always add to it the word *macabelah*, which signifies opposition and comparison: thus *algebra-ahmacabelah*, is what we properly call *algebra*.

Some authors define algebra, The art of solving mathematical problems; but this is rather the idea of analysis, or the analytic art. The Arabs call it, *The art of restitution and comparison*; or, *The art of resolution and equation*. Lucas de Burgo, the first European who wrote of algebra, calls it, *Regula rei et census*; that is, the rule of the root and its square; the root with them being called *res*, and the square *census*. Others call it *Specious Arithmetic*; and some, *Universal Arithmetic*.

History.

It is highly probable that the Indians or Arabians first invented this noble art: for it may be reasonably supposed, that the ancient Greeks were ignorant of it; because Pappus, in his mathematical collections, where he enumerates their analysis, makes no mention of any thing like it; and, besides, speaks of a local problem, begun by Euclid, and continued by Apollonius, which none of them could fully resolve; which doubtless they might easily have done, had they known any thing of algebra.

Diaphantus was the first Greek writer of algebra; who published 13 books about the year 800, though only six of them were translated into Latin, by Xylander, in 1575; and afterwards, viz. anno 1621, in Greek and Latin, by M. Bachet and Fermat, with additions of their own. This algebra of Diaphantus's only extends to the solution of arithmetical indeterminate problems.

Before this translation of Diaphantus came out, Lucas Pacciolus, or Lucas de Burgo, a Minorite friar, published at Venice, in the year 1494, an Italian treatise of algebra. This author makes mention of Leonardus Pifanus, and some others, of whom he had learned the art; but we have none of their writings. He adds, that algebra came originally from the Arabs, and never mentions Diaphantus; which makes it probable, that that author was not then known in Europe. His algebra goes no farther than simple and quadratic equations.

After Pacciolus appeared Stifelius, a good author; but neither did he advance any farther.

After him came Scipio Ferreus, Cardan, Tartaglia, and some others, who reached as far as the solution of some cubic equations. Bombelli followed these, and went a little farther. At last came Nun-

nius, Ramus, Schoner, Salignac, Clavius, &c. who all of them took different courses, but none of them went beyond quadratics.

In 1590, Vieta introduced what he called his *Specious Arithmetic*, which consists in denoting the quantities, both known and unknown, by symbols or letters. He also introduced an ingenious method of extracting the roots of equations, by approximations; since greatly improved and facilitated by Raphson, Halley, Maclaurin, Simpson, and others.

Vieta was followed by Oughtred, who, in his *Clavis Mathematica*, printed in 1631, improved Vieta's method, and invented several compendious characters, to show the sums, differences, rectangles, squares, cubes, &c.

Harriot, another Englishman, cotemporary with Oughtred, left several treatises at his death; and among the rest, an Analysis, or Algebra, which was printed in 1631, where Vieta's method is brought into a still more commodious form, and is much esteemed to this day.

In 1657, Des Cartes published his geometry, wherein he made use of the literal calculus and the algebraic rules of Harriot; and as Oughtred in his *Clavis*, and Marin. Ghetaldus in his books of mathematical composition and resolution published in 1630, applied Vieta's arithmetic to elementary geometry, and gave the construction of simple and quadratic equations; so Des Cartes applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the constructions of cubic, biquadratic, and other higher equations.

Des Cartes's rule for constructing cubic and biquadratic equations, was farther improved by Thomas Baker, in his *Clavis Geometrica Catholica*, published in 1684; and the foundation of such constructions, with the application of algebra to the quadratures of curves, questions *de maximis et minimis*, the centrobaryc method of Guldinus, &c. was given by R. Slufius, in 1668; as also by Fermat in his *Opera Mathematica*, Baroverl in the *Mem. de Mathem. et de Physique*, and Barrow in his *Lect. Geomet.* In 1708, algebra was applied to the laws of chance and gaming, by R. de Montmort; and since by de Moivre and James Bernouilli.

The elements of the art were compiled and published by Kersey, in 1671; wherein the specious arithmetic, and the nature of equations, are largely explained, and illustrated by a variety of examples: the whole substance of Diaphantus is here delivered, and many things added concerning mathematical composition and resolution from Ghetaldus. The like has been since done by Prestet in 1694, and by Ozanam in 1703: but these authors omit the application of algebra to geometry; which defect is supplied by Guifnec in a French treatise expressly on the subject published in 1704, and P'Hospital in his analytical treatise of the conic sections in 1707. The rules of algebra are also compendiously delivered by Sir Isaac Newton, in his *Arithmetica Universalis*, first published in 1707, which abounds in select examples, and contains several rules and methods invented by the author.

Algebra has also been applied to the consideration and calculus of infinites; from whence a new and extensive branch of knowledge has arisen, called the *Doctrine of Fluxions*, or *Analysis of Infinites*, or the *Calculus Differentialis*.

History.

P A R T I.

INTRODUCTION.

Introduction.

A QUANTITY which can be measured, and is the object of mathematics, is of two kinds, *Number* and *Extension*. The former is treated of in *Arithmetic*; the latter in *Geometry*.

Numbers are ranged in a scale, by the continued repetition of some one number, which is called the *Root*; and, in consequence of this order, they are conveniently expressed in words, and denoted by characters. The operations of arithmetic are easily derived from the established method of notation, and the most simple reasonings concerning the relations of magnitude.

Investigations by the common arithmetic are greatly limited, from the want of characters to express the quantities that are unknown, and their different relations to one another, and to such as are known. Hence letters and other convenient symbols have been introduced to supply this defect; and thus gradually has arisen the science of *Algebra*, properly called *Universal Arithmetic*.

In the common arithmetic too, the given numbers disappear in the course of the operation, so that general rules can seldom be derived from it; but, in algebra, the known quantities, as well as the unknown, may be expressed by letters, which, through the whole operation, retain their original form; and hence may be deduced, not only general canons for like cases, but the dependence of the several quantities concerned, and likewise the determination of a problem, without exhibiting which, it is not completely resolved. This general manner of expressing quantities also, and the general reasonings concerning their connections, which may be founded on it, have rendered this science not less useful in the demonstration of theorems than in the resolution of problems.

If geometrical quantities be supposed to be divided into equal parts, their relations, in respect of magnitude, or their proportions, may be expressed by numbers; one of these equal parts being denoted by the unit. Arithmetic, however, is used in expressing only the conclusions of geometrical propositions; and it is by algebra that the bounds and application of geometry have been of late so far extended.

The proper objects of mathematical science are number and extension; but mathematical inquiries may be instituted also concerning any physical quantities that are capable of being measured or expressed by numbers and extended magnitudes: And, as the application of algebra may be equally universal, it has been called *The science of quantity in general*.

DEFINITIONS.

1. QUANTITIES which are known are generally represented by the first letters of the alphabet, as a, b, c , &c. and such as are unknown by the last letters, as x, y, z , &c.
2. The sign $+$ (*plus*) denotes, that the quantity before which it is placed is to be added. Thus $a+b$ denotes the sum of a and b ; $3+5$ denotes the sum of 3 and 5, or 8. When no sign is expressed, $+$ is understood.

N^o 10.

3. The sign $-$ (*minus*) denotes, that the quantity before which it is placed is to be subtracted. Thus $a-b$ denotes the excess of a above b ; $6-2$ is the excess of 6 above 2, or 4. *Note*, These characters $+$ and $-$, from their extensive use in algebra, are called the *signs*; and the one is said to be *opposite* or *contrary* to the other.

4. Quantities which have the sign $+$ prefixed to them are called *positive* or *affirmative*; and such as have the sign $-$ prefixed to them are called *negative*.

5. Quantities which have the same sign, either $+$ or $-$, are also said to have *like signs*, and those which have different signs are said to have *unlike signs*. Thus $+a, +b$, have like signs, and $+a, -c$, are said to have unlike signs.

6. The *juxtaposition* of letters as in the same word, expresses the product of the quantities denoted by these letters. Thus ab expresses the product of a and b ; bcd expresses the continued product of b, c , and d . The sign \times also expresses the product of any two quantities between which it is placed.

7. A number prefixed to a letter is called a *numerical coefficient*, and expresses the product of the quantity by that number, or how often the quantity denoted by the letter is to be taken. When no number is prefixed, unit is understood.

8. The *quotient* of two quantities is denoted by placing the *dividend* above a small line and the *divisor* below it. Thus $\frac{18}{3}$ is the quotient of 18 divided by 3, or

6 ; $\frac{a}{b}$ is the quotient of a divided by b . This expression of a quotient is also called a *fraction*.

9. A quantity is said to be *simple*, which consists of one part or *Term*, as $+a, -abc$; and a quantity is said to be *compound*, when it consists of more than one term, connected by the signs $+$ or $-$. Thus $a+b, a-b+c$, are compound quantities. If there are two terms, it is called a *binomial*; if three, a *trinomial*, &c.

10. Simple quantities, or the terms of compound quantities, are said to be *like*, which consist of the same letter or letters, equally repeated. Thus $+ab, -5ab$, are like quantities; but $+ab$, and $+aab$, are unlike.

11. The equality of two quantities is expressed, by placing the sign $=$ between them. Thus $x+a=b-c$, means that the sum of x and a is equal to the excess of b above c .

When quantities are considered abstractly, then $+$ and $-$ denote addition and subtraction only, according to Def. 2. and 3. and the terms *positive* and *negative* express the same ideas. In that case, a negative quantity by itself is unintelligible. The sign $+$ also is unnecessary before simple quantities, or before the leading term of a compound quantity which is not negative; though, when such a quantity or term is to be added to another, $+$ must be placed before it, to express that addition; and hence in Def. 2. it is said, that $+$ is understood when no sign is expressed.

In geometry, however, and in certain applications

of

Fundamental operations.

Examp. Mult. $2a+3b$ $m+x$
 By $3ax-4by$ $m-x$

 $6aax+9abx$ $mm+mx$
 $-8aby-12bby$ $-mx-xx$

 Prod. $6aax+9abx-8aby-12bby$ $mm*-xx$

 Mult. $a-b$
 By $c-d$

 $ac-cb$
 $-ad+db$

 Prod. $ac-cb-ad+db$

Of the general Rule for the Signs.

The reason of that rule will appear by proving it, as applied to the last mentioned example of $a-b$ multiplied by $c-d$, in which every case of it occurs.

Since multiplication is a repeated addition of the multiplicand as often as there are units in the multiplier, hence, if $a-b$ is to be multiplied by c , $a-b$ must be added to itself as often as there are units in c , and the product therefore must be $ca-cb$ (Prob. I.).

But this product is too great; for $a-b$ is to be multiplied, not by c , but by $c-d$ only, which is the excess of c above d ; d times $a-b$ therefore, or $da-db$, has been taken too much; hence this quantity must be subtracted from the former part of the product, and the remainder, which (by Prob. II.) is $ca-cb-da+db$, will be the true product required.

Def. 12. When several quantities are multiplied together, any of them is called a *factor* of the product.

13. The products arising from the continual multiplication of the same quantity are called the *powers* of that quantity, which is the root. Thus, aa , aaa , $aaaa$, &c. are powers of the root a .

14. These powers are expressed, by placing above the root, to the right hand, a figure, denoting how often the root is repeated. This figure is called an *index*, or *exponent*, and from it the power is denominated. Thus,

$$\begin{array}{l}
 a \\
 aa \\
 aaa \\
 aaaa
 \end{array}
 \left. \begin{array}{l}
 \text{is called} \\
 \text{the} \\
 \text{Power of the root}
 \end{array} \right\}
 \begin{array}{l}
 \left. \begin{array}{l}
 1st \\
 2d \\
 3d \\
 4th
 \end{array} \right\}
 \begin{array}{l}
 a, \text{ and is other-} \\
 \text{wise expressed} \\
 \text{by }
 \end{array}
 \left. \begin{array}{l}
 a^1 \text{ or } a \\
 a^2 \\
 a^3 \\
 a^4, \text{ \&c.}
 \end{array}
 \right.$$

The 2d and 3d powers are generally called the *square* and *cube*; and the 4th, 5th, and 6th, are also sometimes respectively called the *biquadrate*, *surfsolid*, and *cubocube*.

Cor. Powers of the same root are multiplied by adding their exponents, Thus, $a^3 \times a^2 = a^5$, or $aaa \times aa = aaaaa$, $b^3 \times b = b^4$.

Scholium.

Sometimes it is convenient to express the multiplication of quantities, by setting them down with the sign (\times) between them, without performing the operation according to the preceding rules; thus $a^2 \times b$ is written instead of a^2b ; and $a-b \times c-d$ expresses the product of $a-b$, multiplied by $c-d$.

Def. 15. A *vinculum* is a line drawn over any num-

ber of terms of a compound quantity, to denote those which are understood to be affected by the particular sign connected with it.

Thus, in the last example, it shows that the terms $+a$ and $-b$, and also c and $-d$ are all affected by the sign (\times). Without the vinculum, the expression $a-b \times c-d$ would mean the excess of a above bc and d ; and $a-b \times c-d$ would mean the excess of the product of $a-b$ by c , above d . Thus also, $(a+b)^2$ expresses the second power of $a+b$, or the product of that quantity multiplied by itself; whereas $a+b^2$ would express only the sum of a and b^2 ; and so of others. By some writers a parenthesis ($)$ is used as a vinculum, and $(a+b)^2$ is the same thing as $a+b^2$.

PROB. IV. To divide Quantities.

General Rule for the Signs. If the signs of the divisor and dividend are like, the sign of the quotient is $+$; if they are unlike, the sign of the quotient is $-$.

This rule is easily deduced from that given in Prob. III.; for, from the nature of division, the quotient must be such a quantity as, multiplied by the divisor, shall produce the dividend with its proper sign.

From Def. 8. the quotient of any two quantities may be expressed, by placing the dividend above a line and the divisor below it. But a quotient may often be expressed in a more simple and convenient form, as will appear from the following distinction of the cases.

Case I. When the divisor is simple, and is a factor of all the terms of the dividend. This is easily discovered by inspection; for then the coefficient of the divisor measures that of all the terms of the dividend, and all the letters of the divisor are found in every term of the dividend.

Rule. The letter or letters in the divisor are to be expunged out of each term in the dividend, and the coefficients of each term to be divided by the coefficient of the divisor; the quantity resulting is the quotient.

Ex. a) $ab(b. 2aab) 6a^3bc-4a^2bdc (3ac-2dm$

The reason of this is evident from the nature of division, and from Def. 6. Note. It is obvious from corollary to Prob. III. that powers of the same root are divided by subtracting their exponents.

Thus $a^2 \div a^3 = a^{-1}$ (a^{-1}). Also $a^2b \div a^3b^6 = ab^{-4}$.

Case II. When the divisor is simple, but not a factor of the dividend.

Rule. The quotient is expressed by a fraction, according to Def. 8. viz. by placing the dividend above a line and the divisor below it.

Thus the quotient of $3ab^2$ divided by $2mbc$ is the fraction $\frac{3ab^2}{2mbc}$.

Such expressions of quotients may often be reduced to a more simple form, as shall be explained in the second part of this chapter.

Case III. When the divisor is compound.

Rule.

Rule 1. The terms of the dividend are to be ranged according to the powers of some one of its letters; and those of the divisor, according to the powers of the same letter.

is still a remainder from which the operation may be continued without end. This expression of a quotient is called an *infinite series*; the nature of which shall be considered afterwards. By comparing a few of the first terms, the law of the series may be discovered, by which, without any more division, it may be continued to any number of terms wanted.

Thus, if $a^3+2ab+b^2$ is the dividend, and $a+b$ the divisor, they are ranged according to the powers of a .

2. The first term of the dividend is to be divided by the first term of the divisor (observing the general rule for the signs); and this quotient being set down as a part of the quotient wanted, is to be multiplied by the whole divisor, and the product subtracted from the dividend. If nothing remain, the division is finished: the remainder, when there is any, is a new dividend.

Thus, in the preceding example, a^2 divided by a , gives a , which is the first part of the quotient wanted: and the product of this part by the whole divisor $a+b$, viz. a^2+ab being subtracted from the given dividend, there remains in this example $ab+b^2$.

3. Divide the first term of this new dividend by the first term of the divisor as before, and join the quotient to the part already found, with its proper sign: then multiply the whole divisor by this part of the quotient, and subtract the product from the new dividend; and thus the operation is to be continued till no remainder is left, or till it appear that there will always be a remainder.

Thus, in the preceding example, $+ab$, the first term of the new dividend divided by a , gives b ; the product of which, multiplied by $a+b$, being subtracted from $ab+b^2$, nothing remains, and $a+b$ is the true quotient. The entire operation is as follows.

$$\begin{array}{r} a+b \) \ a^3+2ab+b^2 \ (a+b \\ \underline{a^2+ab} \\ ab+b^2 \\ \underline{ab+ab} \\ b^2 \\ b^2 \\ \hline 0 \end{array}$$

$$\begin{array}{r} 3a-b \) \ 3a^3-12a^2-a^2b+10ab-2b^2 \ (a^2-4a+2b \\ \underline{3a^3} \\ -12a^2 \\ \underline{-12a^2} \\ +6ab-2b^2 \\ \underline{+6ab-2b^2} \\ 0 \end{array}$$

$$\begin{array}{r} 1-a \) \ 1+a+a^2+a^3, \ \&c. \\ \underline{1-a} \\ +a \\ \underline{+a-a^2} \\ +a^2 \\ \underline{+a^2-a^3} \\ +a^3, \ \&c. \end{array}$$

It often happens, as in the last example, that there

Of the General Rule.

The reason of the different parts of this rule is evident; for, in the course of the operation, all the terms of the quotient obtained by it are multiplied by all the terms of the divisor, and the products are successively subtracted from the dividend till nothing remain: that, therefore, from the nature of division, must be the true quotient.

Note. The sign \div is sometimes used to express the quotient of two quantities between which it is placed: Thus, $a^2+x^2 \div a+x$, expresses the quotient of a^2+x^2 divided by $a+x$.

§ 2. OF FRACTIONS.

Definitions.

1. WHEN a quotient is expressed by a fraction, the dividend above the line is called the *numerator*; and the divisor below it is called the *denominator*.
2. If the numerator is less than the denominator, it is called a *proper fraction*.
3. If the numerator is not less than the denominator, it is called an *improper fraction*.
4. If one part of a quantity is an integer, and the other a fraction, it is called a *mixt quantity*.
5. The *reciprocal* of a fraction, is a fraction whose numerator is the denominator of the other; and whose denominator is the numerator of the other. The reciprocal of an integer is the quotient of 1 divided by that integer. Thus, $\frac{b}{a}$ is the reciprocal of $\frac{a}{b}$; and $\frac{1}{m}$ is the reciprocal of m .

The distinctions in Def. 2, 3, 4, properly belong to common arithmetic, from which they are borrowed, and are scarcely used in algebra.

The operations concerning fractions are founded on the following proposition:

If the divisor and dividend be either both multiplied or both divided by the same quantity, the quotient is the same; or, if both the numerator and denominator of the fraction be either multiplied or divided by the same quantity, the value of that fraction is the same.

Thus, let $\frac{a}{b} = c$, then $\frac{ma}{mb} = c$. For, from the nature

of division, if the quotient $\frac{a}{b} (=c)$ be multiplied by the divisor b , the product must be the dividend a . Hence $(\frac{a}{b} \times b =) bc = a$, and likewise $ma = mbc$, and dividing both by mb , $\frac{ma}{mb} = c$. Conversely, if $\frac{ma}{mb} = c$, then also

$$\frac{a}{b} = c.$$

Fundamental operations.

Cor. 1. Hence a fraction may be reduced to another of the same value, but of a more simple form, by dividing both numerator and denominator by any common measure.

$$\text{Thus, } \frac{30ax - 54ay}{8ab + 6ac} = \frac{5x - 9y}{4b + 3c}$$

Cor. 2. A fraction is multiplied by any integer, by multiplying the numerator, or dividing the denominator by that integer: and conversely, a fraction is divided by any integer, by dividing the numerator, or multiplying the denominator by that integer.

PROB. I. To find the greatest common Measure of two Quantities.

1. Of pure numbers.

Rule. Divide the greater by the less: and, if there is no remainder, the less is the greatest common measure required. If there is a remainder, divide the last divisor by it; and thus proceed, continually dividing the last divisor by its remainder, till no remainder is left, and the last divisor is the greatest common measure required.

The greatest common measure of 45 and 63 is 9; the greatest common measure of 187 and 391 is 17. Thus,

$$\begin{array}{r} 45 \overline{)63} 1 \\ \underline{45} \\ 18 \end{array} \quad \begin{array}{r} 187 \overline{)391} 2 \\ \underline{374} \\ 17 \end{array}$$

$$\begin{array}{r} 18 \overline{)45} 2 \\ \underline{36} \\ 9 \end{array} \quad \begin{array}{r} 17 \overline{)187} 11 \\ \underline{187} \\ * \end{array}$$

From the nature of this operation, it is plain that it may always be continued till there be no remainder. The rule depends on the two following principles:

1. A quantity which measures both divisor and remainder must measure the dividend.

2. A quantity which measures both divisor and dividend must also measure the remainder.

For a quantity which measures two other quantities, must also measure both their sum and difference; and, from the nature of division, the dividend consists of the divisor repeated a certain number of times, together with the remainder. By the first it appears, that the number found by this rule is a common measure; and, by the second, it is plain there can be no greater common measure; for, if there were, it must necessarily measure the quantity already found less than itself, which is absurd.

When the greatest common measure of algebraical quantities is required, if either of them be simple, any common simple divisor is easily found by inspection. If they are both compound, any common simple divisor may also be found by inspection. But, when the greatest compound divisor is wanted, the preceding rule is to be applied; only,

Fundamental operations.

2. The simple-divisors of each of the quantities are to be taken out, the remainders in the several operations are also to be divided by their simple divisors, and the quantities are always to be ranged according to the powers of the same letter.

The simple divisors in the given quantities, or in the remainders, do not affect a compound divisor which is wanted; and hence also, to make the division succeed, any of the dividends may be multiplied by a simple quantity. Besides the simple divisors in the remainders not being found in the divisors from which they arise, can make no part of the common measure sought; and for the same reason, if in such a remainder there be any compound divisor which does not measure the divisor from which it proceeds, it may be taken out.

EXAMPLES.

$$\begin{array}{r} a^2 - b^2 \overline{)a^2 - 2ab + b^2} 1 \\ \underline{a^2 - b^2} \\ -2ab + 2b^2 \text{ Remainder, which} \\ \text{divided by } -2b \text{ is } a - b \end{array}$$

If the quantities given are $8a^2b^2 - 10ab^3 + 2b^4$, and $9a^3b - 9a^2b^2 + 3a^2b^3 - 3ab^4$. The simple divisors being taken out, viz. $2b^2$ out of the first, it becomes $4a^2 - 5ab + b^2$, and $3ab$ out of the second, it is $3a^3 - 3a^2b + ab^2 - b^3$. As the latter is to be divided by the former, it must be multiplied by 4, to make the operation succeed, and then it is as follows:

$$\begin{array}{r} 4a^2 - 5ab + b^2 \overline{)12a^3 - 12a^2b + 4ab^2 - 4b^3} 3a \\ \underline{12a^3 - 15a^2b + 3ab^2} \\ 3a^2b + ab^2 - 4b^3 \end{array}$$

This remainder is to be divided by b , and the new dividend multiplied by 3, to make the division proceed. Thus,

$$\begin{array}{r} 3a^2 + ab - 4b^2 \overline{)12a^2 - 15ab + 3b^2} 4 \\ \underline{12a^2 + 4ab - 16b^2} \\ -19ab + 19b^2 \end{array}$$

and this remainder, divided by $-19b$, gives $a - b$, which being made a divisor, divides $3a^2 + ab - 4b^2$ without a remainder, and therefore $a - b$ is the greatest compound divisor: but there is a simple divisor b , and therefore $a - b \times b$ is the greatest common measure required.

PROB. II. To reduce a Fraction to its lowest Terms.

Rule. Divide both numerator and denominator by their greatest common measure, which may be found by prob. I.

Thus, $\frac{75abc}{125bcx} = \frac{3a}{5x}$, $25bc$ being the greatest common measure, $\frac{a^4 - b^4}{a^5 - a^2b^2} = \frac{a^2 + b^2}{a^3}$ also, $\frac{9a^4b - 9a^2b^2 + 3a^2b^3 - 3ab^4}{8a^2b^2 - 10ab^3 + 2b^4} = \frac{9a^3 + 3ab^2}{8ab - 2b^2}$ the greatest common measure being $a - b \times b$, by Prob. I.

PROB.

Fundamen-
tal opera-
tions.

PROB. III. To reduce an Integer to the Form of a Fraction.

Rule. Multiply the given integer by any quantity for a numerator, and set that quantity under the product for a denominator.

$$\text{Thus, } a = \frac{ma}{m}, \quad a + b = \frac{a^2 - b^2}{a - b}$$

Cor. Hence, in the following operations concerning fractions, an integer may be introduced; for, by this problem, it may be reduced to the form of a fraction. The denominator of an integer is generally made 1.

PROB. IV. To reduce Fractions with different Denominators to Fractions of equal Value, that shall have the same Denominator.

Rule. Multiply each numerator, separately taken into all the denominators but its own, and the products shall give the new numerators. Then multiply all the denominators into one another, and the product shall give the common denominator.

Example. Let the fractions be $\frac{a}{b}, \frac{c}{d}, \frac{e}{f}$ they are respectively equal to $\frac{adf}{bdf}, \frac{bcf}{bdf}, \frac{bde}{bdf}$

The reason of the operation appears from the preceding proposition; for the numerator and denominator of each fraction are multiplied by the same quantities; and the value of the fractions therefore is the same.

PROB. V. To add and subtract Fractions.

Rule. Reduce them to a common denominator, then add or subtract the numerators; and the sum or difference set over the common denominator is the sum or remainder required.

Ex. Add together $\frac{a}{b}, \frac{c}{d}, \frac{e}{f}$ the sum is $\frac{adf + cbf + bde}{bdf}$,

From $\frac{a}{b}$ subtr. $\frac{c}{d}$ the difference is $\frac{ad - bc}{bd}$.

From the nature of division it is evident, that, when several quantities are to be divided by the same divisor, the sum of the quotients is the same with the quotient of the sum of the quantities divided by that common divisor.

In like manner, the difference of two fractions having the same denominator, is equal to the difference of the numerators divided by that common denominator.

Cor. 1. By Cor. Prob. 3. integers may be reduced to the form of fractions, and hence integers and fractions may be added and subtracted by this rule. Hence also what is called a mixt quantity may be reduced into the form of a fraction by bringing the integral part into the form of a fraction, with the same denominator as the fractional part, and adding or subtracting the numerators according as the two parts are connected by the signs + or -.

$$\text{Thus, } b + \frac{c}{d} = \frac{bd + c}{d} \quad \text{and} \quad a - \frac{a^2 - b^2}{2a} = \frac{2a^2 - a^2 + b^2}{2a} = \frac{a^2 + b^2}{2a}$$

Cor. 2. A fraction, whose numerator is a compound quantity, may be distinguished into parts, by dividing the numerator into several parts, and setting each over the original denominator, and uniting the new fractions (reduced if necessary) by the signs of their numerators.

$$\text{Thus, } \frac{a^2 - 2ab + b^2}{2a} = \frac{a^2}{2a} - \frac{2ab}{2a} + \frac{b^2}{2a} = \frac{a}{2} - b + \frac{b^2}{2a}$$

PROB. VI. To multiply Fractions.

Rule. Multiply their numerators into one another, to obtain the numerator of the product; and the denominators, multiplied into one another, shall give the denominator of the product.

$$\text{Ex. } \frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd} \quad \frac{a+b}{c} \times \frac{a-b}{d} = \frac{a^2 - b^2}{cd}$$

For, if $\frac{a}{b}$ is to be multiplied by c , the product is $\frac{ca}{b}$;

but if it is to be multiplied only by $\frac{c}{d}$ the former product must be divided by d , and it becomes $\frac{ca}{bd}$ (Cor. 2. to the preceding problem.)

Or, let $\frac{a}{b} = m$, and $\frac{c}{d} = n$. Then $a = bm$, and $c = dn$, and $ac = bdmn$, and $(mn) \frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$.

PROB. VII. To divide Fractions.

Rule. Multiply the numerator of the dividend by the denominator of the divisor; their product shall give the numerator of the quotient. Then multiply the denominator of the dividend by the numerator of the divisor, and their product shall give the denominator.

Or, Multiply the dividend by the reciprocal of the divisor; the product will be the quotient wanted.

$$\text{Thus, } \frac{a}{b} \div \frac{c}{d} \left(\frac{bc}{ad} = \frac{c}{d} \times \frac{b}{a} \right)$$

For, if $\frac{c}{d}$ is to be divided by a , the quotient is $\frac{c}{da}$;

but $\frac{c}{d}$ is to be divided, not by a , but by $\frac{a}{b}$; therefore the former quotient must be multiplied by b , and it is $\frac{bc}{da}$.

Or, let $\frac{a}{b} = m$, and $\frac{c}{d} = n$; then $a = bm$, and $c = dn$; also $ad = bdm$ and $bc = bdn$; therefore $\left(\frac{bdn}{bdm} = \frac{n}{m} = \frac{bc}{ad} \right)$

Scholium.

By these problems, the four fundamental operations may be performed, when any terms of the original quantities, or of those which arise in the course of the operation, are fractional.

Ex-

Of Proportion.

Example.

Mult. $\frac{a^3}{2x} \dots \frac{3ax}{2b}$

By $\frac{ab}{3x} - 4x$

Prod. $\frac{a^3b}{6x^2} - \frac{a^2}{2} - 2a^2 + \frac{6ax^2}{b}$

$a+x) \frac{a^3+x^2}{a^2+ax} (a-x + \frac{2x^2}{a} - \frac{2x^3}{a^2}, \&c.$

$-ax+x^2$

$-ax-x^2$

$2x^2$

$2x^2 + 2x^3$

a

$\frac{2x^3}{a}$

$\frac{2x^3}{a} - \frac{2x^4}{a^2}$

$+\frac{2x^4}{a^2}, \&c.$

This quotient becomes a series, of which the law of continuation is obvious, without any farther operation.

In such cases, when we arrive at a remainder of one term, it is commonly set down with the divisor below it, after the other terms of the quotient, which then becomes a mixt quantity. Thus the last quotient is also expressed by $a-x + \frac{2x^2}{a+x}$

CHAP. II.

Of Proportion.

By the preceding operations quantities of the same kind may be compared together.

The relation arising from this comparison is called *ratio* or *proportion*, and is of two kinds. If we consider the difference of the two quantities, it is called *arithmetical proportion*; and if we consider their quotient, it is called *geometrical proportion*. This last being most generally useful, is commonly called simply *proportion*.

1. Of Arithmetical Proportion.

Definition. When of four quantities the difference of the first and second is equal to the difference of the third and fourth, the quantities are called *arithmetical proportionals*.

Cor. Three quantities may be arithmetically proportional, by supposing the two middle terms of the four to be equal.

Prop. In four quantities arithmetically proportional, the sum of the extremes is equal to the sum of the means.

Let the four be a, b, c, d . Therefore from Def. $a-b=c-d$; to these add $b+d$ and $a+d=b+c$.

Cor. 1. Of four arithmetical proportionals, any three being given, the fourth may be found.

Thus, let a, b, c , be the 1st, 2d, and 4th terms, and let x be the 3d which is sought.

Then by def. $a+c=b+x$, and $x=a+c-b$.

Cor. 2. If three quantities be arithmetical proportionals, the sum of the extremes is double of the middle term; and hence, of three such proportionals, any two being given, the third may be found.

2. Of Geometrical Proportion.

Definition. If of four quantities, the quotient of the first and second is equal to the quotient of the third and fourth, these quantities are said to be in *geometrical proportion*. They are also called *proportionals*. Thus, if a, b, c, d , are the four quantities, then $\frac{a}{b} = \frac{c}{d}$. and their ratio is thus denoted $a : b :: c : d$.

Cor. Three quantities may be geometrical proportionals, viz. by supposing the two middle terms of the four to be equal. If the quantities are a, b, c , then $\frac{a}{b} = \frac{b}{c}$, and the proportion is expressed thus, $a : b :: b : c$.

Prop. I. The product of the extremes of four quantities geometrically proportional is equal to the product of the means; and conversely.

Let $a : b :: c : d$.

Then by Def. $\frac{a}{b} = \frac{c}{d}$

and multiplying both by bd , $ad=bc$.

If $ad=bc$, then dividing by bd , $\frac{a}{b} = \frac{c}{d}$, that is, $a : b :: c : d$.

Cor. 1. The product of the extremes of three quantities, geometrically proportional, is equal to the square of the middle term.

Cor. 2. Of four quantities geometrically proportional, any three being given, the fourth may be found.

Ex. Let a, b, c , be the three first; to find the 4th. Let it be x , then $a : b :: c : x$, and by this proposition,

$ax=bc$

and dividing both by a , $x = \frac{bc}{a}$.

This coincides with the Rule of Three in arithmetic, and may be considered as a demonstration of it. In applying the rule to any particular case, it is only to be observed, that the quantities must be so connected and so arranged, that they be proportional, according to the preceding definition.

Cor. 3. Of three geometrical proportionals, any two being given, the third may be found.

Prop. II. If four quantities be geometrically proportional, then if any equimultiples whatever be taken of the first and third, and also any equimultiples whatever of the second and fourth; if the multiple of the first be greater than that of the second, the multiple of the third will be greater than that of the fourth; and if equal, equal; and if less, less.

For, let a, b, c, d , be the four proportionals. Of the

Of Equations.

Of Equations.

the first and third, ma and mc may represent any equimultiples whatever, and also nb , nd , may represent any equimultiples of the second and fourth. Since $a:b::c:d$, $ad=bc$; and hence multiplying by mn , $mnad=mnbc$, and therefore (Conv. Prop. 1.) $ma:nb::mc:nd$; and from the definition of proportionals, it is plain, that if ma is greater than nb , mc must be greater than nd ; and if equal, equal; and if less, less.

Prop. III. If four quantities are proportionals, they will also be proportionals when taken alternately or inversely, or by composition, or by division, or by conversion. See Def. 13. 14. 15. 16. 17. of Book V. of Euclid, Simson's edition.

By Prop. II. they will also be proportionals according to Def. 5. Book V. of Euclid; and therefore this proposition is demonstrated by propositions 16, B, 18, 17, E, of the same book.

Otherwise algebraically.

Let $a:b::c:d$, and therefore $ad=bc$.

Altern. $a:c::b:d$
 Invert. $b:a::d:c$
 Divid. $a-b:b::c-d:d$
 Comp. $a+b:b::c+d:d$
 Convert. $a:a-b::c:c-d$

For since $ad=bc$, it is obvious, that in each of these cases the product of the extremes is equal to the product of the means; the quantities are therefore proportionals. (Prop. 1.)

Prop. IV. If four numbers be proportionals, according to Def. 5. V. B. of Euclid, they will be geometrically proportional, according to the preceding definition.

1st, Let the four numbers be integers, and let them be a , b , c , d . Then if b times a and b times c be taken, and also a times b and a times d , since ba the multiple of the first is equal to ab the multiple of the second, bc , the multiple of the third, must be equal to ad the multiple of the fourth. And since $bc=ad$, by Prop. 1. a , b , c , and d , must be geometrical proportionals.

2^{dly}, If any of the numbers be fractional, all the four being multiplied by the denominators of the fractions, they continue proportionals, according to Def. 5. B. V. Euclid (by Prop. 4. of that book); and the four integer quantities produced being such proportionals, they will be geometrical proportionals, by the first part of this prop.; and therefore, being reduced by division to their original form, they manifestly will remain proportionals, according to the algebraical definition.

CHAP. III.

SECT. I. Of Equations in general, and of the Solution of simple Equations.

Definitions.

1. An Equation may in general be defined to be a proposition asserting the equality of two quantities;

and is expressed by placing the sign $=$ between them.

- When a quantity stands alone upon one side of an equation, the quantities on the other side are said to be a *value* of it. Thus in the equation $x=b+y-d$, x stands alone on one side, and $b+y-d$ is a value of it.
- When an unknown quantity is made to stand alone on one side of an equation, and there are only known quantities on the other, that equation is said to be *resolved*; and the value of the unknown quantity is called a *root* of the equation.
- Equations containing only one unknown quantity and its powers, are divided into *orders*, according to the highest power of the unknown quantity to be found in any of its terms.

If the highest power of the unknown quantity in any term be the } 1st, } The Equation is called } *Simple*,
 } 2^d, } } *Quadrat.*
 } 3^d, &c. } } *Cubic*, &c.

But the exponents of the unknown quantity are supposed to be integers, and the equation is supposed to be cleared of fractions, in which the unknown quantity, or any of its powers, enter the denominators.

Thus, $x+a=\frac{3x-b}{c}$ is a simple equation; $3x-\frac{5}{2x}=12$, when cleared of the fraction by multiplying both sides by $2x$, becomes $6x^2-5=24x$ a quadratic. $x^3-2x^2=x^6-20$ is an equation of the sixth order, &c.

As the general relations of quantity which may be treated of in algebra, are almost universally either that of equality, or such as may be reduced to that of equality, the doctrine of equations becomes one of the chief branches of the science.

The most common and useful application of algebra is in the investigation of quantities that are unknown, from certain given relations to each other, and to such as are known; and hence it has been called the *analytical art*. The equations employed for expressing these relations must therefore contain one or more unknown quantities; and the principal business of this art will be, the deducing equations containing only one unknown quantity, and resolving them.

The solution of the different orders of equations will be successively explained. The preliminary rules in the following section are useful in all orders, and are alone sufficient for the solution of simple equations.

§ 1. Of simple Equations, and their Resolution.

Simple equations are resolved by the four fundamental operations already explained; and the application of them to this purpose is contained in the following rules.

Rule 1. Any quantity may be transposed from one side of an equation to the other, by changing its sign.

Thus, if $3x-10=2x+5$

Then, $3x-2x=10+5$ or $x=15$

Thus also, $5x+b=a+2x$

By transp. $3x=a-b$.

This rule is obvious from prob. 1. and 2.; for it is equivalent to adding equal quantities to both sides of the equation, or to subtracting equal quantities from both sides.

Cor.

Of Equations.

Cor. The signs of all the terms of an equation may be changed into the contrary signs, and it will continue to be true.

Rule 2. Any quantity by which the unknown quantity is multiplied may be taken away, by dividing all the other quantities of the equation by it.

$$\begin{aligned} \text{Thus, if } ax &= b \\ x &= \frac{b}{a} \\ \text{Also, if } mx + nb &= am \\ x + \frac{nb}{m} &= a \end{aligned}$$

For if equal quantities are divided by the same quantity, the quotients are equal.

Rule 3. If a term of an equation is fractional, its denominator may be taken away, by multiplying all the other terms by it.

$$\begin{aligned} \text{Thus, if } \frac{x}{a} &= b + c & \text{Also, if } a - \frac{b}{x} &= c \\ x &= ab + ac & ax - b &= cx \\ \text{And by transf. } ax - cx &= b \\ \text{And by div. } x &= \frac{b}{a - c} \end{aligned}$$

For if all the terms of the equation are multiplied by the same quantity, it remains a true proposition.

Corollary to the three last Rules.

If any quantity be found on both sides of the equation, with the same sign, it may be taken away from both. (*Rule 1.*)

Also, if all the terms in the equation are multiplied or divided by the same quantity, it may be taken out of them all. (*Rule 2. and 3.*)

$$\begin{aligned} \text{Ex. If } 3x + a &= a + b, \text{ then } 3x = b. \\ \text{If } 2ax + 3ab &= ma + a^2, \text{ then } 2x + 3b = m + a. \\ \text{If } \frac{x}{3} - \frac{4}{3} &= \frac{16}{3}, \text{ then } x - 4 = 16, \end{aligned}$$

Any simple equation may be resolved by these rules in the following manner. *1st*, Any fractions may be taken away by *R. 3.* *2^{dly}*, All the terms including the unknown quantity, may be brought to one side of the equation, and the known terms to the other, by *R. 1.* *Lastly*, If the unknown quantity is multiplied by any known quantity, it may be made to stand alone by *R. 2.* and the equation will then be resolved. *Def. 3.*

Examples of simple Equations resolved by these Rules.

$$\begin{aligned} \text{I.} \\ \text{If } 3x + 5 &= x + 9 \\ \text{R. 1. } 2x &= 4 \\ \text{R. 2. } x &= \frac{4}{2} = 2 \\ \text{II.} \\ \text{If } 5x - \frac{5x}{2} + 12 &= \frac{4x}{3} + 26 \\ \text{R. 1. } 5x - \frac{5x}{2} - \frac{4x}{3} &= 14 \\ \text{R. 3. } 30x - 15x - 8x &= 84 \end{aligned}$$

N^o II.

$$\begin{aligned} \text{Or } 7x &= 84 \\ \text{R. 2. } x &= \frac{84}{7} = 12 \end{aligned}$$

III.

$$\begin{aligned} \text{If } \frac{5}{x} + \frac{9}{4} &= 16 \\ \text{R. 3. } \frac{20}{x} + 9 &= 64 \\ \text{R. 3. } 20 + 9x &= 64x \\ \text{R. 1. } 20 &= 55x \\ \text{R. 2. } x &= \frac{20}{55} = \frac{4}{11} \end{aligned}$$

§ 2. *Solution of Questions producing simple Equations.*

From the resolution of equations we obtain the resolution of a variety of useful problems, both in pure mathematics and physics, and also in the practical arts founded upon these sciences. In this place, we consider the application of it to those questions where the quantities are expressed by numbers, and their magnitude alone is to be considered.

When an equation, containing only one unknown quantity, is deduced from the question by the following rules, it is sometimes called a *final equation*. If it be simple, it may be resolved by the preceding rules; but if it be of a superior order, it must be resolved by the rules afterwards to be explained. The examples in this chapter are so contrived, that the final equation may be simple.

The rules given in this section for the solution of questions, though they contain a reference to simple equations only, are to be considered as general, and as applicable to questions which produce equations of any order.

General Rule. The unknown quantities in the question proposed must be expressed by letters, and the relations of the known and unknown quantities contained in it, or the conditions of it, as they are called, must be expressed by equations. These equations being resolved by the rules of this science, will give the answer of the question.

For example, if the question is concerning two numbers, they may be called *x* and *y*, and the conditions from which they are to be investigated must be expressible by equations.

$$\begin{aligned} \text{Thus, if it be required that the} \\ \text{sum of two numbers sought} \\ \text{be 60, that condition is ex-} \\ \text{pressed thus } \left. \begin{array}{l} \\ \\ \\ \end{array} \right\} x + y = 60 \\ \text{If their difference must be 24, then } x - y = 24 \\ \text{If their product is 1640, then } xy = 1640 \\ \text{If their quotient must be 6, then } \frac{x}{y} = 6 \\ \text{If their ratio is as 3 to 2, then } \left. \begin{array}{l} \\ \\ \end{array} \right\} 2x = 3y \\ \text{ } x : y :: 3 : 2, \text{ and therefore } \end{aligned}$$

These are some of the relations which are most easily expressed. Many others occur which are less obvious; but as they cannot be described in particular rules, the algebraical expression of them is best explained by examples, and must be acquired by experience.

A

Of Equations.

Of Equations.

Of Equations.

A distinct conception of the nature of the question, and of the relations of the several quantities to which it refers, will generally lead to the proper method of stating it, which in effect may be considered only as a translation from common language into that of algebra.

added a half, a third part, and a fourth part of itself, the sum will be 50.

Let it be z : then half of it is $\frac{z}{2}$, a third of it $\frac{z}{3}$, &c,

$$\begin{aligned} \text{Therefore, } z + \frac{z}{2} + \frac{z}{3} + \frac{z}{4} &= 50 \\ 24z + 12z + 8z + 6z &= 1200 \\ 50z &= 1200 \\ z &= 24. \end{aligned}$$

If the operation be more complicated, it may be useful to register the several steps of it, as in the following

Examp. 2. A trader allows L. 100 *per annum* for the expences of his family, and augments yearly that part of his stock which is not so expended by a third of it; at the end of three years his original stock was doubled. What had he at first?

Let his first stock be
Of which he spends the first year L. 100, and there remains
This remainder is increased by a third of itself
The second year he spends L. 100, and there remains
He increases the remainder by one-third of it
The third year he spends L. 100, and there remains
He increases it by one-third
But at the end of the third year his stock is doubled; therefore
By R. 3.
By R. 1.
By R. 2.

$$\begin{aligned} 1 \quad & z \\ 2 \quad & z - 100 \\ 3 \quad & z - 100 + \frac{z - 100}{3} = \frac{4z - 400}{3} \\ 4 \quad & \frac{4z - 400}{3} - 100 = \frac{4z - 700}{3} \\ 5 \quad & \frac{4z - 700}{3} + \frac{4z - 700}{9} = \frac{16z - 2800}{9} \\ 6 \quad & \frac{16z - 2800}{9} - 100 = \frac{16z - 3700}{9} \\ 7 \quad & \frac{16z - 3700}{9} + \frac{16z - 3700}{27} = \frac{64z - 14800}{27} \\ 8 \quad & \frac{64z - 14800}{27} = 2z \\ 9 \quad & 64z - 14800 = 54z \\ 10 \quad & 10z = 14800 \\ 11 \quad & z = 1480 \end{aligned}$$

Therefore his stock was L. 1480; which being tried, answers the conditions of the question.

tion, under two different forms, from which no solution can be derived.

Case II. When there are two unknown quantities.

Examp. 3. Two persons, A and B, were talking of their ages: says A to B, Seven years ago I was just three times as old as you were, and seven years hence I shall be just twice as old as you will be. I demand their present ages.

Rule. Two independent equations involving the two unknown quantities, must be derived from the question. A value of one of the unknown quantities must be derived from each of the equations: and these two values being put equal to each other, a new equation will arise, involving only one unknown quantity, and may therefore be resolved by the preceding rule.

$$\begin{aligned} \text{Let the ages of A and B be respectively} & \left. \begin{array}{l} 1 \quad x \text{ and } y \\ 2 \quad x - 7 \text{ and } y - 7 \\ 3 \quad x + 7 \text{ and } y + 7 \end{array} \right\} \\ \text{Seven years ago they were} & \\ \text{Seven years hence they will be} & \\ \text{Therefore by Quest. 1. and 2.} & \left. \begin{array}{l} 4 \quad x - 7 = 3 \times y - 7 = 3y - 21 \\ 5 \quad x + 7 = 2 \times y + 7 = 2y + 14 \end{array} \right\} \\ \text{Also by Quest. 2. and 3.} & \\ \text{By 4. and transp.} & 6 \quad x = 3y - 14 \\ \text{By 5. and transp.} & 7 \quad x = 2y + 7 \\ \text{By 6. and 7.} & 8 \quad 3y - 14 = 2y + 7 \\ \text{Transp. and 8.} & 9 \quad y = 21 \\ \text{By 9. and 6. or 7.} & 10 \quad x = 49 \end{aligned}$$

Two equations must be deduced from the question: for, from one including two unknown quantities, it is plain, a known value of either of them cannot be obtained, more than two equations would be unnecessary; and if any third condition were assumed at pleasure, most probably it would be inconsistent with the other two, and a question containing three such conditions would be absurd.

The ages of A and B then are 49 and 21, which answer the conditions.

It is to be observed, however, that the two conditions, and hence the two equations expressing them, must be independent; that is, the one must not be deducible from the other by any algebraical reasoning: for, otherwise, there would in effect be only one equation.

Of Equations.

The operation might have been a little shortened by subtracting the 4th from 5th, and thus $14 = -y + 35$; and hence $y = 21$. therefore (by 6th) $x = (3y - 14) = 49$.

Examp. 4. A gentleman distributing money among some poor people, found he wanted 10s. to be able to give 5s. to each; therefore he gives each 4s. only, and finds he has 5s. left.—To find the number of shillings and poor people.

If any question such as this, in which there are two quantities sought, can be resolved by means of one letter, the solution is in general more simple than when two are employed. There must be, however, two independent conditions; one of which is used in the notation of one of the unknown quantities, and the other gives an equation.

Let the number of poor be z
 The number of shillings will be $25z - 10$
 The number of shillings is also $34z + 5$
 By 2. and 3. $45z - 10 = 4z + 5$.
 Transp. $5z = 15$.

The number of poor therefore is 15, and the number of shillings is $(4z + 5 =) 65$, which answer the conditions.

Examp. 5. A courier sets out from a certain place, and travels at the rate of 7 miles in 5 hours; and 8 hours after, another sets out from the same place, and travels the same road, at the rate of 5 miles in 3 hours: I demand how long and how far the first must travel before he is overtaken by the second?

Let the number of hours which the first travelled be y
 Then the second travelled $y - 8$
 The first travelled seven miles in 5 hours, and therefore in y hours $(5 : 7 :: y : \frac{7y}{5})$ miles
 In like manner the second travelled in $y - 8$ hours $(3 : 5 :: y - 8 : \frac{5y - 40}{3})$ miles
 But they both travelled the same number of miles; therefore by 3. and 4. $\frac{7y}{5} = \frac{5y - 40}{3}$
 Mult. $21y = 5y - 40$
 Transp. $16y = -40$
 Divid. $y = 50$

The first then travelled 50 hours, the second $(y - 8 =) 42$ hours.

The miles travelled by each $(\frac{7y}{5} = \frac{5y - 40}{3} =) 70$.

Case III. When there are three or more unknown quantities.

Rule. When there are three unknown quantities, there must be three independent equations arising from the question; and from each of these a value of one of the unknown quantities must be obtained. By comparing these three values, two equations will arise, involving only two unknown quantities, which may therefore be resolved by the rule for Case 2.

In like manner may the rule be extended to such questions as contain four or more unknown quantities; and hence it may be inferred, That, when just as many

independent equations may be derived from a question as there unknown quantities in it, these quantities may be found by the resolution of equations.

Of Equations.

Examp. 6. To find three numbers, so that the first, with half the other two, the second with one third of the other two, and the third with one fourth of the other two, may each be equal to 34.

Let the numbers be x, y, z , and the equations are

1	$x + \frac{y+z}{2} = 34$
2	$y + \frac{x+z}{3} = 34$
3	$z + \frac{x+y}{4} = 34$
4	$x = \frac{68 - y - z}{2}$
From the 1st	
5	$x = 102 - 3y - z$
From the 2d	
6	$x = 136 - 4z - y$
From the 3d	
7	$\frac{68 - y - z}{2} = 102 - 3y - z$
From 4th and 5th	
8	$y = \frac{136 - z}{5}$
7th reduced	
9	$y = \frac{3z - 34}{2}$
5 = 6, and reduced	
10	$\frac{3z - 34}{2} = \frac{136 - z}{5}$
8 and 9	
11	$15z - 170 = 272 - 2z$
10th reduced	
12	$17z = 442$ or $z = 26$
By 8 and 5	$y = 22$ and $x = 10$

Examp. 7. To find a number consisting of three places, whose digits are in arithmetical proportion; if this number be divided by the sum of its digits, the quotient will be 48; and if from the number be subtracted 198, the digits will be inverted.

Let the 3 digits be x, y, z
 Then the number is $100x + 10y + z$
 If the digits be inverted, it is $100z + 10y + x$
 The digits are in ar. prop. therefore $4x + z = 2y$
 By question $\frac{100x + 10y + z}{x + y + z} = 48$
 By question $100x + 10y + z - 198 = 100z + 10y + x$
 From 6 and transf. $99x = 99z + 198$
 Divid. by 99 $x = z + 2$
 From 4 $4x = 2y - z$
 8 and 9 $2y - z = z + 2$
 Transp. $y = z + 1$
 Mult. 5. $100x + 10y + z = 48x + 48y + 48z$
 Transp. $52x = 38y + 47z$
 8 and 11 subtit. for x and y $52z + 104 = 38z + 38 + 47z$
 Transp. $33z = 66$
 Divid. $z = 2$
 $y = (z + 1) = 3$
 $x = (z + 2) = 4$

The number then is 432, which succeeds upon trial.

Of Equations.

It sometimes happens, that all the unknown quantities, when there are more than two, are not in all the equations expressing the conditions, and therefore the preceding rule cannot be literally followed. The solution, however, will be obtained by such substitutions as are used in Ex. 7. and 9. or by similar operations, which need not be particularly described.

Corollary to the preceding Rules.

It appears that, in every question, there must be as many independent equations as unknown quantities; if there are not, then the question is called *indeterminate*, because it may admit of an infinite number of answers; since the equations wanting may be assumed at pleasure. There may be other circumstances, however, to limit the answers to one, or a precise number, and which, at the same time, cannot be directly expressed by equations. Such are these; that the numbers must be integers, squares, cubes, and many others. The solution of such problems, which are also called *diophantine*, shall be considered afterwards.

Scholium.

On many occasions, by particular contrivances, the operations by the preceding rules may be much abridged. This however, must be left to the skill and practice of the learner. A few examples are the following.

1. It is often easy to employ fewer letters than there are unknown quantities, by expressing some of them from a simple relation to others contained in the conditions of the question. Thus, the solution becomes more easy and elegant. (See Ex. 4. 5.)

2. Sometimes it is convenient to express by letters, not the unknown quantities themselves, but some other quantities connected with them, as their sum, difference, &c. from which they may be easily derived. (See Ex. 1. of chap. 5.)

In the operation also, circumstances will suggest a more easy road than that pointed out by the general rules. Two of the original equations may be added together, or may be subtracted; sometimes they must be previously multiplied by some quantity, to render such addition or subtraction effectual, in exterminating one of the unknown quantities, or otherwise promoting the solution. Substitutions may be made of the values of quantities, in place of quantities themselves, and various other such contrivances may be used, which will render the solution much less complicated. (See Ex. 3. 7. and 9.)

SECT. II. *General Solution of Problems.*

In the solutions of the questions in the preceding

Of Equations.

part, the given quantities (being numbers) disappear in the last conclusion, so that no general rules for like cases can be deduced from them. But if letters are used to denote the known quantities, as well as the unknown, a general solution may be obtained, because, during the whole course of the operation, they retain their original form. Hence also the connection of the quantities will appear in such a manner as to discover the necessary limitations of the data, when there are any, which is essential to the perfect solution of a problem. From this method, too, it is easy to derive a synthetical demonstration of the solution.

When letters, or any other such symbols, are employed to express all the quantities, the algebra is sometimes called *specious* or *literal*.

Examp. 8. To find two numbers, of which the sum and difference are given.

Let s be the given sum, and d the given difference. Also, let x and y be the two numbers sought.

$$\begin{aligned} x+y &= s \\ x-y &= d \\ \text{Whence } \begin{cases} x &= s-y \\ x &= d+y \end{cases} \\ d+y &= s-y \\ 2y &= s-d \\ y &= \frac{s-d}{2} \\ \text{And } x &= \frac{s+d}{2} \end{aligned}$$

Thus, let the given sum be 100, and the difference 24. Then $x = \left(\frac{s+d}{2} = \frac{124}{2}\right) 62$ & $y = \left(\frac{s-d}{2} = \frac{76}{2}\right) 38$.

In the same manner may the canon be applied to any other values of s and d . By reversing the steps in the operation, it is easy to show, that if $x = \frac{s+d}{2}$ and $y = \frac{s-d}{2}$, the sum of x and y must be s , and their difference d .

Examp. 9. If A and B together can perform a piece of work in the time a , A and C together in the time b , and B and C together in the time c , in what time will each of them perform it alone?

Let A perform the work in the time x , B in y , and C in z ; then as the work is the same in all cases, it may be represented by unity.

3 E 2

By

	1	$(x : 1 :: a : \frac{a}{x})$	$\frac{a}{x} =$	} to the work performed by	A in a days
	2	$(y : 1 :: a : \frac{a}{y})$	$\frac{a}{y} =$		B in a days
	3	$(x : 1 :: b : \frac{b}{x})$	$\frac{b}{x} =$		A in b days
	4	$(z : 1 :: b : \frac{b}{z})$	$\frac{b}{z} =$		C in b days
By the question	5	$(y : 1 :: c : \frac{c}{y})$	$\frac{c}{y} =$		B in c days
	6	$(z : 1 :: c : \frac{c}{z})$	$\frac{c}{z} =$		C in c days
	7	$\frac{a}{x} + \frac{a}{y} = 1$ and $ay + ax = xy$			
	8	$\frac{b}{x} + \frac{b}{z} = 1$ and $bz + bx = xz$			
	9	$\frac{c}{y} + \frac{c}{z} = 1$ and $cz + cy = zy$			
Mult. 7th by $\frac{bc}{xy}$	10	$\frac{abc}{x} + \frac{abc}{y} = bc$			
Mult. 8th by $\frac{ac}{xz}$	11	$\frac{abc}{x} + \frac{abc}{z} = ac$			
Mult. 9th by $\frac{ab}{zy}$	12	$\frac{abc}{y} + \frac{abc}{z} = ab$			
Add 10th, 11th, 12th,	13	$\frac{2abc}{x} + \frac{2abc}{y} + \frac{2abc}{z} = bc + ac + ab$			
From 13th subtr. twice 10th	14	$\frac{2abc}{z} = ac + ab - bc$ & $z = \frac{2abc}{ac + ab - bc}$			
From 13th subtr. twice 11th	15	$\frac{2abc}{y} = bc + ab - ac$ & $y = \frac{2abc}{bc + ab - ac}$			
From 13th subtr. twice 12th	16	$\frac{2abc}{x} = bc + ac - ab$ & $x = \frac{2abc}{bc + ac - ab}$			

Example in numbers. Let $a = 8$ days, $b = 9$ days, and $c = 10$; then $x = 14\frac{34}{49}y = 17\frac{23}{41}$, and $z = 23\frac{7}{31}$.

It appears likewise that a, b, c , must be such, that the product of any two of them must be less than the sum of these two multiplied by the third. This is necessary to give positive values of x, y , and z , which alone can take place in this question. Besides, if x, y , and z be assumed as any known numbers whatever, and if values of a, b , and c be deduced from steps 7th, 8th, and 9th, of the preceding operation, it will appear, that a, b , and c will have the property required in the limitation here mentioned.

If a, b , and c were such, that any of the quantities, x, y , or z , became equal to 0, it implies that one of the agents did nothing in the work. If the values of any of these quantities be negative, the only supposition which could give them any meaning would be, that some of the agents, instead of promoting the work, either obstructed it, or undid it to a certain extent.

Exampl. 10. In question 5th, let the first courier travel p miles in q hours; the second r miles in s hours; let the interval between their setting out be a ,

Then by working as formerly,

$$x = \frac{qra}{qr - ps}$$

If particular values be inserted for these letters, a particular solution will be obtained for that case. Let them denote the numbers in Example 5.

Then $x = \left(\frac{qra}{qr - ps} = \frac{5 \times 5 \times 8}{5 \times 5 - 7 \times 3} = \frac{200}{4} = 50 \right)$

Here it is obvious, that qr must be greater than ps , else the problem is impossible; for then the value of x would either be infinite or negative. This limitation appears also from the nature of the question, as the second courier must travel at a greater rate than the first, in order to overtake him. For the rate of the first courier is to the rate of the second as $\frac{p}{q}$ to $\frac{r}{s}$, that is, as ps to qr ; and therefore qr must be greater than ps .

Scholium.

Sometimes when there are many known quantities in a general solution, it may simplify the operation to express certain combinations of them by new letters, still to be considered as known.

CHAP. IV.

Of Involution and Evolution.

In order to resolve equations of the higher orders, it is necessary to premise the rules of *Involution* and *Evolution*.

LEMMA.

The reciprocals of the powers of a quantity may be expressed by that quantity, with negative exponents of the same denomination. That is, the series $a, 1, \frac{1}{a}, \frac{1}{a^2}, \frac{1}{a^3}, \frac{1}{a^m}$, &c. may be expressed by $a^1, a^0, a^{-1}, a^{-2}, a^{-3}, a^{-m}$, &c.

For the rule for dividing the powers of the same root was to subtract the exponents; if then the index of the divisor be greater than that of the dividend, the index of the quotient must be negative.

Thus, $\frac{a^2}{a^3} = a^2 - 3 = a^{-1}$. Also, $\frac{a^2}{a^3} = \frac{1}{a^1}$.
 $\frac{a^m}{a^m} = a^m - m = a^0$. And, $\frac{a^m}{a^m} = 1$. and so on of others.

Cor. 1. Hence any quantity which multiplies either the numerator or denominator of a fraction, may be transposed from the one to the other, by changing the sign of its index.

Thus, $\frac{x}{y^2} = xy^{-2}$. And $\frac{a^2 x}{y^3} = \frac{a^2}{y^3 x^{-1}}$, &c.

Cor. 2. From this notation, it is evident that these *negative powers*, as they are called, are multiplied by adding, and divided by subtracting their exponents.

Thus, $a^{-2} \times a^{-3} = a^{-5}$.
 Or, $\frac{1}{a^2} \times \frac{1}{a^3} = \frac{1}{a^5} = a^{-5}$.
 $\frac{a^{-1}}{a^{-3}} = a^2$ Or, $\frac{1}{a^3} \div \frac{1}{a^1} = a^2$

I. Of Involution.

To find any power of any quantity is the business of involution.

Case I. When the quantity is simple.

Rule. Multiply the exponents of the letters by the index of the power required, and raise the coefficient to the same power.

Thus, the 2d power of a is $a^1 \times 2 = a^2$

The 3d power of $2a^2$ is $8a^2 \times 3 = 8a^6$

The 3d power of $3ab^3$ is $27a^3 \times 3b^3 \times 3 = 27a^3b^9$.

For the multiplication would be performed by the continued addition of the exponents; and this multiplication of them is equivalent. The same rule holds also when the signs of the exponents are negative.

Rule for the signs. If the sign of the given quantity is $+$, all its powers must be positive. If the sign is $-$, then all its powers whose exponents are even numbers are positive; and all its powers whose exponents are odd numbers are negative.

This is obvious from the rule for the signs in multiplication.

The last part of it implies the most extensive use of the signs $+$ and $-$, by supposing that a negative quantity may exist by itself.

Case 2. When the quantity is compound.

Rule. The powers must be found by a continual multiplication of it by itself.

Thus, the square of $x + \frac{a}{2}$ is found by multiplying it into itself. The product is $x^2 + ax + \frac{a^2}{4}$. The cube of $x + \frac{a}{2}$ is got by multiplying the square already found by the root, &c.

Fractions are raised to any power, by raising both numerator and denominator to that power, as is evident from the rule for multiplying fractions in Chap. I.

§ 2. The involution of compound quantities is rendered much easier by the binomial theorem; for which see Chap. VI.

Note. The square of a binomial consists of the squares of the two parts, and twice the product of the two parts.

II. Of Evolution.

Evolution is the reverse of involution, and by it powers are resolved into their roots.

Def. The root of any quantity is expressed by placing before it $\sqrt{\quad}$ (called a *radical sign*) with a small figure above it, denoting the denomination of that root.

Thus, the square root of a , is $\sqrt[2]{a}$ or \sqrt{a}

The cube root of bc , is $\sqrt[3]{bc}$

The 4th root of $a^2b - x^3$, is $\sqrt[4]{a^2b - x^3}$

The m th root of $c^2 - dx$, is $\sqrt[m]{c^2 - dx}$

General Rule for the Signs.

1. The root of any positive power may be either positive or negative, if it is denominated by an even number; if the root is denominated by an odd number, it is positive only.
2. If the power is negative, the root also is negative, when it is denominated by an odd number.
3. If the power is negative, and the denomination of the root even, then no root can be assigned.

This rule is easily deduced from that given in involution, and supposes the same extensive use of the signs $+$ and $-$. If it is applied to abstract quantities in which a contrariety cannot be supposed, any root of a positive quantity must be positive only; and any root of a negative quantity, like itself, is unintelligible.

In the last case, though no root can be assigned, yet sometimes it is convenient to set the radical sign before the negative quantity, and then it is called an *impossible* or *imaginary* root.

The root of a positive power, denominated by an even number, has often the sign \pm before it, denoting that it may have either $+$ or $-$.

The radical sign may be employed to express any root of any quantity whatever; but sometimes the root may be accurately found by the following rules; and when it cannot, it may often be more conveniently expressed by the methods now to be explained.

Case I. When the quantity is simple.

Rule. Divide the exponents of the letters by the index of the root required, and prefix the root of the numeral coefficient.

1. The exponents of the letters may be multiples of the index of the root, and the root of the coefficient may be extracted.

Thus, the square root of $a^4 = a^{\frac{4}{2}} = \pm a^2$

$$^3\sqrt{27a^6} = 3a^{\frac{6}{3}} = 3a^2$$

$$^4\sqrt{a^4b^{12}} = a^{\frac{4}{4}}b^{\frac{12}{4}} = \pm ab^3.$$

2. The exponents of the letters may not be multiples of the index of the root, and then they become fractions; and when the root of the coefficient cannot be extracted, it may also be expressed by a fractional exponent, its original index being understood to be 1.

$$\text{Thus, } \sqrt[3]{16a^3b^2} = 4a^{\frac{3}{3}}b^{\frac{2}{3}}$$

$$^3\sqrt{7ax^3} = 7^{\frac{1}{3}}a^{\frac{1}{3}}x = ^3\sqrt{7} \times a^{\frac{1}{3}}x.$$

As evolution is the reverse of involution, the reason of the rule is evident.

The root of any fraction is found by extracting that root out of both numerator and denominator.

Case II. When the quantity is compound.

1. To extract the square root.

Rule. 1. The given quantity is to be ranged according to the powers of the letters, as in division.

Thus,

Of Involution and Evolution.

Thus, in the example $a^2 + 2ab + b^2$, the quantities are ranged in this manner.
 2. The square root is to be extracted out of the first term (by preceding rules), which gives the first part of the root sought. Subtract its square from the given quantity, and divide the first term of the remainder by double the part already found, and the quotient is the second term of the root.

Thus, in this example, the remainder is $2ab + b^2$; and $2ab$ being divided by $2a$, the double of the part found, gives $+b$ for the second part of the root.

3. Add this second part to double of the first, and multiply their sum by the second part: Subtract the product from the last remainder, and if nothing remain, the square root is obtained. But, if there is a remainder, it must be divided by the double of the parts already found, and the quotient would give the third part of the root; and so on.

In the last example, it is obvious, that $a + b$ is the square root sought.

The entire operation is as follows.

$$\begin{array}{r}
 a^2 + 2ab + b^2 \quad (a + b \\
 \hline
 a^2 \\
 \hline
 2a + b \quad + 2ab + b^2 \\
 \times b \quad \quad \quad 2ab + b^2 \\
 \hline
 * \\
 x^4 - ax^2 + \frac{a^2}{4} \left(x^2 - \frac{a}{2} \right) \\
 \hline
 x^4 \\
 \hline
 2x^2 - \frac{a}{2} \quad - ax^2 + \frac{a^2}{4} \\
 \times \frac{a}{2} \quad \quad - ax^2 + \frac{a^2}{4} \\
 \hline
 *
 \end{array}$$

The reason of this rule appears from the composition of a square.

2. To extract any other root.

Rule. Range the quantity according to the dimensions of its letters, and extract the said root out of the first term, and that shall be the first member of the root required. Then raise this root to a dimension lower by unit than the number that denominates the root required, and multiply the power that arises by that number itself. Divide the second term of the given quantity by the product, and the quotient shall give the second member of the root required.—In like manner are the other parts to be found, by considering those already got as making one term.

Thus, the fifth root of

$$\begin{array}{r}
 a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5 \quad (a + b \\
 \hline
 a^5 \\
 \hline
 5a^4 \quad) \quad 5a^4b
 \end{array}$$

And $a + b$ raised to the 5th power is the given quantity, and therefore it is the root sought.

In evolution it will often happen, that the operation will not terminate, and the root will be expressed by a series.

Thus, the square root of $a^2 + x^2$ becomes a series.

$$\begin{array}{r}
 a^2 + x^2 \left(a + \frac{x^2}{2a} - \frac{x^4}{8a^3} + \frac{x^6}{16a^5}, \&c.. \right) \\
 \hline
 a^2 \\
 \hline
 2a + \frac{x^2}{2a} \quad) \quad * + x^2 \\
 \times \frac{x^2}{2a} \quad \quad \quad = x^2 + \frac{x^4}{4a^2} \\
 \hline
 2a + \frac{x^2}{a} - \frac{x^4}{8a^3} \quad) \quad * - \frac{x^4}{4a^2} \\
 \times -\frac{x^4}{8a^3} \quad \quad \quad = -\frac{x^4}{4a^2} - \frac{x^6}{8a^5} + \frac{x^8}{64a^6} \\
 \hline
 * + \frac{x^6}{8a^5} - \frac{x^8}{64a^6}, \&c..
 \end{array}$$

The extraction of roots by series is much facilitated by the binomial theorem (Chap. vi. Sect. 3.) By similar rules, founded on the same principles, are the roots of numbers to be extracted.

III. Of Surds.

Def. Quantities with fractional exponents are called *surd*s, or *imperfect powers*.

Such quantities are also called *irrational*s; in opposition to others with integral exponents, which are called *rational*.

Surd

s may be expressed either by the fractional exponents, or by the radical sign, the denominator of the fraction being its index; and hence the orders of surds are denominated from this index.

In the following operations, however, it is generally convenient to use the notation by the fractional exponents.

$$a^{\frac{1}{2}} = \sqrt{a}, \quad \sqrt[3]{a} = a^{\frac{1}{3}}, \quad \sqrt[4]{a} = a^{\frac{1}{4}}, \quad \sqrt[5]{a} = a^{\frac{1}{5}}$$

The operations concerning surds depend on the following principle: If the numerator and denominator of a fractional exponent be both multiplied or both divided by the same quantity, the value of the power is the same. Thus $a^{\frac{m}{n}} = a^{\frac{mc}{nc}}$: for let $a^{\frac{m}{n}} = b$; then $a^m = b^n$, and $a^{mc} = b^{nc}$, and extracting the root nc , $a^{\frac{mc}{nc}} = b^{\frac{nc}{nc}} = b = a^{\frac{m}{n}}$.

Lem. A rational quantity may be put into the form of a surd, by reducing its index to the form of a fraction of the same value.

$$\begin{array}{l}
 \text{Thus } a = a^{\frac{2}{2}} = \sqrt{a^2} \\
 a^2b = a^{\frac{6}{3}}b^{\frac{1}{3}} = \sqrt[3]{a^6b^1}
 \end{array}$$

PROB. I. To reduce surds of different denominations to others of the same value and of the same denomination.

Rule.

Of Involu-
tion and
Evolution.

Of Involu-
tion and
Evolution.

Rule. Reduce the fractional exponents to others of the same value and having the same common denominator.

Ex. $\sqrt{a}, \sqrt[3]{b^2}$ or $a^{\frac{1}{2}}, b^{\frac{2}{3}}$

but $a^{\frac{1}{2}} = a^{\frac{3}{6}}$ and $b^{\frac{2}{3}} = b^{\frac{4}{6}}$.

therefore \sqrt{a} , and $\sqrt[3]{b^2}$ are respectively equal to $\sqrt[6]{a^3}$ and $\sqrt[6]{b^4}$.

PROB. II. To multiply and divide surds.

1. When they are surds of the same rational quantity, add and subtract their exponents.

Thus, $a^{\frac{1}{3}} \times a^{\frac{2}{3}} = a^{\frac{1}{3} + \frac{2}{3}} = a^{\frac{3}{3}} = a^1 = \sqrt{a^3}$

$$\frac{\sqrt{a^2 - b^2}}{\sqrt[3]{a^2 - b^2}} = \frac{a^2 - b^2)^{\frac{1}{2}}}{(a^2 - b^2)^{\frac{1}{3}}} = (a^2 - b^2)^{\frac{1}{2} - \frac{1}{3}} = (a^2 - b^2)^{\frac{1}{6}} = \sqrt[6]{a^2 - b^2}$$

2. If they are surds of different rational quantities, let them be brought to others of the same denomination, if already they are not, by prob. 1. Then, by multiplying or dividing these rational quantities, their product or quotient may be set under the common radical sign.

Thus, $\sqrt[m]{a} \times \sqrt[n]{b} = a^{\frac{1}{m}} b^{\frac{1}{n}} = \sqrt[mn]{a^n b^m}$

$$\frac{\sqrt{a^2 - b^2}}{\sqrt{a + b}} = \sqrt{\frac{a^2 - b^2}{a + b}} = \sqrt{a - b}$$

$$\frac{\sqrt[4]{a^3 b^2}}{\sqrt[3]{a^2 b}} = \frac{a^{\frac{3}{4}} b^{\frac{2}{4}}}{a^{\frac{2}{3}} b^{\frac{1}{3}}} = a^{\frac{3}{4} - \frac{2}{3}} b^{\frac{2}{4} - \frac{1}{3}} = a^{\frac{1}{12}} b^{\frac{1}{6}} = \sqrt[12]{a b^2}$$

$$a^{\frac{1}{3}} b^{\frac{2}{3}} = \sqrt[3]{ab^2}$$

If the surds have any rational coefficients, their product or quotient must be prefixed. Thus,

$a\sqrt{m} \times b\sqrt{n} = ab\sqrt{mn}$. It is often convenient, in the operations of this problem, not to bring the surds of simple quantities to the same denomination, but to express their product or quotient without the radical sign, in the same manner as if they were rational quantities. Thus, the product in Ex. 1. may be $a^{\frac{1}{m}} b^{\frac{1}{n}}$, and the quotient in Ex. 3. $a^{\frac{1}{12}} b^{\frac{1}{6}}$

Cor. If a rational coefficient be prefixed to a radical sign, it may be reduced to the form of a surd by the lemma, and multiplied by this problem; and conversely, if the quantity under the radical sign be divisible by a perfect power of the same denomination, it may be taken out, and its root prefixed as a coefficient.

$$a\sqrt{b} = \sqrt{a^2 b}; 2 \times \sqrt[3]{a} = \sqrt[3]{8a}$$

Conv. $\sqrt{a^2 b^3} = ab\sqrt{b}; \sqrt{4a^2 - 8a^2 b} = 2a\sqrt{1 - 2b}$.

Even when the quantity under the radical sign is not divisible by a perfect power, it may be useful sometimes to divide surds into their component factors, by reversing the operation of this problem.

Thus $\sqrt{ab} = \sqrt{a} \times \sqrt{b}, \sqrt[3]{a^2 b - bx^2} = \sqrt[3]{ba - bx} \times \sqrt[3]{a + x} = b^{\frac{1}{3}} \times \sqrt[3]{a - x} \times \sqrt[3]{a + x}$.

PROB. III. To involve or evolve Surds.

This is performed by the same rules as in other quantities, by multiplying or dividing their exponents by the index of the power or root required.

The notation by negative exponents, mentioned in the lemma at the beginning of this chapter, is applicable to fractional exponents, in the same manner as to integers.

Scholium.

The application of the rules of this chapter to the resolving of equations, shall be explained in the succeeding chapters, which treat of the solution of the different classes of them; but some examples of their use in preparing equations for a solution are the following.

If a member of an equation be a surd root, then the equation may be freed from any surd, by bringing that member first to stand alone upon one side of the equation, and then taking away the radical sign from it, and raising the other side to the power denominated by the index of that surd.

This operation becomes a necessary step towards the solution of an equation, when any of the unknown quantities are under the radical sign.

Example. If $3\sqrt{x^2 - a^2} + 2y = a + y$

Then $3\sqrt{x^2 - a^2} = a - y$

and $9 \times x^2 - a^2 = a^2 - 2ay + y^2$

If the unknown quantity be found only under the radical sign, and only of the first dimension, the equation will become simple, and may be resolved by the preceding rules.

Thus, if $\sqrt[3]{4x + 16} + 5 = 9$

Then $\sqrt[3]{4x + 16} = 4$

And $4x + 16 = 64$

$4x = 48$

And $x = 12$

If $\sqrt[m]{a^2 x - b^2 x} = a$

Then $a^2 x - b^2 x = a^m$

$$x = \frac{a^m}{a^2 - b^2}$$

If the unknown quantity in a final equation has fractional exponents, by means of the preceding rules a new equation may be substituted, in which the exponents of the unknown quantity are integers.

Thus, if $x^{\frac{1}{2}} + 3x^{\frac{2}{3}} = 10$, by reducing the surds to the same denomination, it becomes $x^{\frac{3}{6}} + 3x^{\frac{4}{6}} = 10$; and if $z = x^{\frac{1}{6}}$, then $z^3 + 3z^4 = 10$; and if this equation be resolved from a value of z , a value of x may be got by the rules of the next chapter. Thus also, if $x + 2x^{\frac{1}{2}} - 3x^{\frac{1}{3}} = 100$. If $x^{\frac{1}{6}} = z$, this equation becomes $z^6 + 2z^3 - 3z^2 = 100$.

In general, if $x^{\frac{p}{q}} + x^{\frac{m}{n}} = a$, by reducing the surds

to the same denomination $x^{\frac{pn}{nq}} + x^{\frac{qm}{qn}} = a$, and if

$x^{\frac{1}{qn}} = z$, then the equation is $z^{pn} + z^{qm} = a$, in which

the

Equations. the exponents of z are integers; and z being found, x is to be found from the equation $x^{\frac{1}{qz}} = z$.

$$x^z = \frac{b^3 - a^2}{a}$$

$$x = \sqrt{\frac{b^3 - a^2}{a}}$$

Equations.

$$x^m = \frac{b-c}{a-1}$$

$$x = \sqrt[m]{\frac{b-c}{a-1}}$$

CHAP. V.

EQUATIONS were divided into orders according to the highest index of the unknown quantity in any term. (chap. 3.)

Equations are either *pure* or *adfected*.

Def. 1. A *pure equation* is that in which only one power of the unknown quantity is found.

2. An *adfected equation*, is that in which different powers of the unknown quantity are found in the several terms.

Thus, $a^2 + ax^2 = b^3$, $ax^2 - b^2 = m^2 + x^2$ are pure equations.

And $x^2 - ax = b^2$, $x^3 + x^2 = 17$, are adfected.

1. Solution of pure Equations.

Rule. Make the power of the unknown quantity to stand alone by the rules formerly given, and then extract the root of the same denomination out of both sides, which will give the value of the unknown quantity.

EXAMPLES.

If $a^2 + ax^2 = b^3$ $ax^m - b = x^m - c$
 $ax^2 = b^3 - a^2$ $ax^m - x^m = b - c$

Then by Ex. 8. chap. 3.

The proportionals are	1	$\frac{a+z}{2} : \frac{b+y}{2} : \frac{b-y}{2} : \frac{a-z}{2}$
Mult. by 2 and still	2	$a+z : b+y : b-y : a-z$
From the three first	3	$ab - ay + bz - zy = b^2 + 2by + y^2$
From the three last	4	$ab + ay - bz - zy = b^2 - 2by + y^2$
3d added to 4th	5	$2ab - 2zy = 2b^2 + 2y^2$
4th subtr. from 3d	6	$2bz - 2ay = 4by$
6th reduced	7	$z = \frac{2by + ay}{b}$
7th subst. for z in 5th	8	$2ab - 2 \times \frac{2by^2 + ay^2}{b} = 2b^2 + 2y^2$
Transp. and divide 8th by $\frac{2}{b}$	9	$ab^2 - b^3 = 3by^2 + ay^2$
	10	$\frac{ab^2 - b^3}{3b + a} = y^2$ and $y = \sqrt{\frac{ab^2 - b^3}{3b + a}}$
In numbers	11	$y = \sqrt{\frac{ab^2 - b^3}{3b + a}} = b \sqrt{\frac{a-b}{3b+a}} = 24 \sqrt{\frac{32}{128}} = 12$
	12	$z = \frac{2b + a}{b} \times y = 52$

Hence the four proportionals are 54, 18, 6, 2; and it appears that b must not be greater than a , otherwise the root becomes impossible, and the problem would also be impossible; which limitation might be deduced also from prop. 25. V. of Euclid.

2. Solution of adfected Quadratic Equations.

Adfected equations of different orders are resolved by different rules, successively to be explained.

An adfected quadratic equation (commonly called a quadratic) involves the unknown quantity itself, and also its square: It may be resolved by the following N° 11.

The index of the power may also be fractional; as in the last example m may be any number whatever. Let $m = \frac{1}{2}$, then as before,

$$x^m = x^{\frac{1}{2}} = \frac{b-c}{a-1}$$

$$\text{And } x = \left[\frac{b-c}{a-1} \right]^2 = \frac{b^2 - 2bc + c^2}{a^2 - 2a + 1}$$

Sometimes different powers of the unknown quantity are found in the equation, yet the several terms may form on one side a perfect power, of which the root being extracted, the equation will become simple.

Thus, if $x^3 - 12x^2 + 48x = 98$, it is easy to observe that $x^3 - 12x^2 + 48x - 64 = 34$; forming a complete cube; of which the root being extracted, $x - 4 = \sqrt[3]{34}$. And $x = 4 + \sqrt[3]{34}$.

Examp. 1. To find four continued proportionals, of which the sum of the extremes is 56, and the sum of the means 24.

To resolve the question in general terms, let the sum of the extremes be a , the sum of the means b , and let the difference of the extremes be called z , and the difference of the means y .

Rule. 1. Transpose all the terms involving the unknown quantity to one side, and the known terms to the other; and so that the term containing the square of the unknown quantity may be positive.

2. If the square of the unknown quantity is multiplied by any coefficient, all the terms of the equation are to be divided by it, so that the coefficient of the square of the unknown quantity may be 1.

3. Add to both sides the square of half the coefficient of the unknown quantity itself, and the side of the equation involving the unknown quantity will be a complete square.

4. Extract

Equations. 4. Extract the square root from both sides of the equation, by which it becomes simple, and by transposing the above mentioned half coefficient, a value of the unknown quantity is obtained in known terms, and therefore the equation is resolved.

The reason of this rule is manifest from the composition of the square of a binomial, for it consists of the squares of the two parts, and twice the product of the two parts. (*Note*, at the end of Chap. IV.)

The different forms of quadratic equations, expressed in general terms, being reduced by the first and second parts of the rule, are these;

- 1. $x^2 + ax = b^2$
 - 2. $x^2 - ax = b^2$
 - 3. $x^2 - ax = -b^2$
- Case 1. $x^2 + ax = b^2$
- $$x^2 + ax + \frac{a^2}{4} = b^2 + \frac{a^2}{4}$$
- $$x + \frac{a}{2} = \pm \sqrt{\frac{b^2 + \frac{a^2}{4}}{4}}$$
- $$x = \pm \sqrt{\frac{b^2 + \frac{a^2}{4}}{4}} - \frac{a}{2}$$
- Case 2. $x^2 - ax = b^2$
- $$x^2 - ax + \frac{a^2}{4} = b^2 + \frac{a^2}{4}$$
- $$x - \frac{a}{2} = \pm \sqrt{\frac{b^2 + \frac{a^2}{4}}{4}}$$
- $$x = \frac{a}{2} \pm \sqrt{\frac{b^2 + \frac{a^2}{4}}{4}}$$
- Case 3. $x^2 - ax = -b^2$
- $$x^2 - ax + \frac{a^2}{4} = \frac{a^2}{4} - b^2$$
- $$x - \frac{a}{2} = \pm \sqrt{\frac{\frac{a^2}{4} - b^2}{4}}$$
- $$x = \frac{a}{2} \pm \sqrt{\frac{\frac{a^2}{4} - b^2}{4}}$$

Of these cases it may be observed,

1. That if it be supposed, that the square root of a positive quantity may be either positive or negative, according to the most extensive use of the signs, every quadratic equation will have two roots, except such of the third form, whose roots become impossible.

2. It is obvious, that, in the two first forms, one of the roots must be positive, and the other negative.

3. In the third form, if $\frac{a^2}{4}$, or the square of half the coefficient of the unknown quantity, be greater than b^2 , the known quantity, the two roots will be positive. If $\frac{a^2}{4}$ be equal to b^2 , the two roots then become equal.

But if in this third case $\frac{a^2}{4}$ is less than b^2 , the quantity under the radical sign becomes negative, and the two roots are therefore impossible. This may be easily shown to arise from an impossible supposition in the original equation.

4. If the equation, however, expresses the relation of magnitudes abstractly considered, where a contrariety cannot be supposed to take place, the negative roots cannot be of use, or rather there are no such roots;

VOL I. Part II.

for then a negative quantity by itself is unintelligible, and therefore the square root of a positive quantity must be positive only. Hence, in the two first cases, there will be only one root; but in the third, there will be two. For in this third case, $x^2 - ax = -b^2$, or $ax - x^2 = b^2$, it is obvious that x may be either greater or less than $\frac{1}{2}a$, and yet $a - x$ may be positive; and hence $a - x \times x = ax - x^2$ may also be positive, and may be equal to a given positive quantity b^2 : therefore the square root of $x^2 - ax + \frac{1}{4}a^2$ may be either $x - \frac{1}{2}a$ or $\frac{1}{2}a - x$, and both these quantities also positive.

Equations.

Let then $x - \frac{a}{2} = \sqrt{\frac{a^2}{4} - b^2}$ and $x = \frac{a}{2} + \sqrt{\frac{a^2}{4} - b^2}$. Also let $\frac{a}{2} - x = \sqrt{\frac{a^2}{4} - b^2}$; and hence $x = \frac{a}{2} - \sqrt{\frac{a^2}{4} - b^2}$, and these are the same two positive roots as were obtained by the general rule.

The general rule is usually employed, even in questions where negative numbers cannot take place, and then the negative roots of the two first forms are neglected. Sometimes even only one of the positive roots of the third case can be used, and the other may be excluded by a particular condition in the question. When an impossible root arises in the solution of a question, and if it be resolved in general terms, the necessary limitation of the data will be discovered.

When a question can be so stated as to produce a pure equation, it is generally to be preferred to an affected. Thus the question in the preceding section, by the most obvious notation, would produce an affected equation.

2. *Solution of Questions producing Quadratic Equations.*

The expression of the conditions of the question by equations, or the stating of it, and the reduction likewise of these equations, till we arrive at a quadratic equation, involving only one unknown quantity and its square, are effected by the same rules which were given for the solution of simple equations in Chap III.

Examp. 2. One lays out a certain sum of money in goods, which he sold again for L.24, and gained as much per cent. as the goods cost him: I demand what they cost him?

If the money laid out be	1	y
The gain will be	2	$24 - y$
But this gain is	3	$\frac{2400 - 100y}{y}$ per cent.
($y:24-y::100:$)	3	
Therefore by question	4	$y = \frac{2400 - 100y}{y}$
And by mult. and tr.	5	$y^2 + 100y = 2400$
Completing the square	6	$y^2 + 100y + 50^2 = 2400 + 2500 = 4900$
Extr. the root	7	$y + 50 = \pm \sqrt{4900} = 70$
Transp.	8	$y = \pm 70 - 50 = 20$ or -120 .

The answer is 20l. which succeeds. The other root, -120, has no place in this example, a negative number being here unintelligible.

Any quadratic equation may be resolved also by the general canons at the beginning of this section. That

Equations. arising from this question, (No. 5.) belongs to Cafe I. and $a=100, b^2=2400$; therefore,

$$y = \left(-\frac{a}{2} \pm \sqrt{\frac{a^2}{4} + b^2} \right) - \frac{100}{2} \pm \sqrt{\frac{100^2}{4} + 2400} = 20 \text{ or } -120 \text{ as before.}$$

Examp. 3. What two numbers are those, whose difference is 15, and half of whose product is equal to the cube of the lesser?

Let the lesser number be	1	x
The greater is	2	$x+15$
By question	3	$\frac{x^2+15x}{2} = x^3$
Divide by x and mult. by 2	4	$x+15 = 2x^2$
	5	$x^2 - \frac{x}{2} = \frac{15}{2}$
4th prepared	6	$x^2 - \frac{x}{2} + \frac{1}{16} = \frac{15}{2} + \frac{1}{16} = \frac{121}{16}$
Complete square	7	$x - \frac{1}{4} = \pm \frac{11}{4}$
Ext. $\sqrt{\quad}$	8	$x = 3 \text{ or } -\frac{5}{2}$
Transp.		

The numbers therefore are 3 and 18, which answer the conditions. This is an example of Cafe 2d, and the negative root is neglected.

A solution, indeed, may be represented by means of the negative root $-\frac{5}{2}$; for then the other number is $(x+15) = -\frac{5}{2} + 15 = \frac{25}{2}$. And $\frac{1}{2} \times \frac{25}{2} \times -\frac{5}{2}$, is equal to the cube of $-\frac{5}{2}$. Such a solution, though useless, and even absurd, it is plain must correspond to the conditions, if those rules with regard to the signs be used in the application of it, by which it was itself deduced. The same observation may be extended even to impossible roots; which being assumed as the answer of a question, must, by reversing the steps of the investigation, correspond to the original equations, by which the conditions of that question were expressed.

Examp. 4. To find two numbers whose sum is 100, and whose product is 2059.

Let the given sum $100=a$, the product $2059=b$, and let one of the numbers sought be x , the other will be $a-x$. Their product is $ax-x^2$.

Therefore by question	1	$ax-x^2=b$ or $x^2-ax=-b$
Complete the square	2	$x^2-ax+\frac{a^2}{4}=\frac{a^2}{4}-b$
Ext. $\sqrt{\quad}$	3	$x-\frac{a}{2}=\pm\sqrt{\frac{a^2}{4}-b}$
Transp.	4	$x=\frac{a}{2}\pm\sqrt{\frac{a^2}{4}-b}$
And the other number	5	$a-x=\frac{a}{2}\pm\sqrt{\frac{a^2}{4}-b}$

By inserting numbers, $x=71$ or 29 and $a-x=29$ or 71 , so that the two numbers sought are 71 and 29.

Here it is to be observed, that b must not be greater than $\frac{a^2}{4}$, else the roots of the equation would be impossible; that is, the given product must not be greater than the square of half the given sum of the numbers sought. This limitation can easily be shown from other principles; for, the greatest possible product of two parts, into which any number may be divided, is when each of them is a half of it. If b be equal to $\frac{a^2}{4}$, there is only one solution, and $x=\frac{a}{2}$, also $a-x=\frac{a}{2}$.

Examp. 5. There are three numbers in continual geometrical proportion: The sum of the first and second is 10, and the difference of the second and third is 24. What are the numbers?

Let the first be	1	z
The second will be	2	$10-z$
And the third	3	$34-z$
Since $z:10-z:$	4	$z^2-20z+100=34z-z^2$
34-z	5	$2z^2-54z=-100$
Transp.	6	$z^2-27z=-50$
Divid.	7	$z^2-27z+\frac{27^2}{4}=\frac{729}{4}-50=\frac{529}{4}$
Compl. the square	8	$z-\frac{27}{2}=\pm\sqrt{\frac{529}{4}=\frac{23}{2}}$
Extract the $\sqrt{\quad}$	9	$z=\frac{27}{2}\pm\frac{23}{2}=25 \text{ or } 2.$
Transp.		

But though there are two positive roots in this equation, yet one of them only can here be of use, the other being excluded by a condition in the question. For as the sum of the first and second is 10, 25 cannot be one of them: 2 therefore is the first, and the proportionals will be 2, 8, 32.

This restriction will also appear from the explanation given of the third form, to which this equation belongs. For z may be less than $\frac{27}{2}$, but from the first condition of the question it cannot be greater; hence the quantity $z^2-27z+\frac{27^2}{4}$ can have only one

square root, viz. $\frac{27}{2}-z$; and this being put equal to

$$\sqrt{\frac{529}{4}}, \text{ we have by transposition } z = \frac{27}{2} - \frac{23}{2} = 2,$$

which gives the only just solution of the question.

From the other root, indeed, a solution of the question may be represented by means of a negative quantity. If the first then be 25, the three proportionals will be 25, -15, 9. These also must answer the conditions, according to the rules given for negative quantities, though such a solution has no proper meaning.

Besides, it is to be observed, that if the following question be proposed, 'To find three numbers in geometrical proportion, so that the difference of the first and

By

and

Equations. and $2d$ may be 10 , and the sum of the $2d$ and $3d$ may be 24 , the equation in step 6th will be produced; for, if the $1st$ be z , the $2d$ is $z-10$, and the $3d$ $34-z$, and therefore $34z-z^2=z^2-20z+100$, the very same equation as in step 4th. In this question it is plain that the root 25 only can be useful, and the three proportionals are $25, 15, 9$.

But the necessary limitations of such a problem are properly to be derived from a general notation. Let the sum of the two first proportionals be a , and the difference of the two last b . If a is not greater than b , the first term must be the least; but if a be greater than b , the first term must be either the greatest or the least.

When the first term is the least, the proper notation of the three terms is $z, a-z, a+b-z$, and the equation when ordered is $z^2 - \frac{3a+b}{2}z = -\frac{a^2}{2}$. If the first term be the greatest, and then a is greater than b , the notation of the terms is $z, a-z, a-b-z$, and the corresponding equation is $z^2 - \frac{3a-bz}{2} = -\frac{a^2}{2}$.

Of the first of these equations it may be observed, that whatever be the value of a and b , the square of $\frac{3a+b}{4}$, viz, of half the coefficient of z , is greater than

$\frac{a^2}{2}$, and therefore the roots are always possible. If the square be completed, and the roots extracted, they become $z - \frac{3a+b}{4} = \frac{\sqrt{3a+b)^2 - 8a^2}}{4}$, and $\frac{3a+b}{4} - z = \frac{\sqrt{3a+b)^2 - 8a^2}}{4}$.

But in this case z is the least of the three terms, and therefore a is greater than $2z$, or $\frac{a}{2}$ is greater than z ; much more than is $\frac{3a+b}{4}$ greater than z ; and therefore the second root only can be admitted, and $z = \frac{3a+b - \sqrt{3a+b)^2 - 8a^2}}{4}$ is the only proper solution.

In the second equation, since a is greater than b , $\frac{3a-b}{2}$ must be always positive, and therefore the equation is necessarily of the third form. But the roots are possible only when $\frac{3a-b)^2}{4}$, is not less than $\frac{a^2}{2}$, that is, when a^2+b^2 is not less than $6ab$, or when $a-b$ is not less than $2\sqrt{ab}$. When the roots are possible, z may be either greater or less than $\frac{3a-b}{4}$, and hence each root gives a proper solution; therefore, $z = \frac{3a-b \pm \sqrt{3a-b)^2 - 8a^2}}{4}$.

Ex. Let $a=40$ and $b=6$. The first term in this case may be assumed either as the greatest or the least. And, first, if z be the greatest, the roots of the equation will be possible, since $(a^2+b^2=)$ 1636 is greater than $(6ab=)$ 1440 . The two values of z are 32 and 25 , and the proportionals are either $32, 8, 2$, or $25, 15, 9$. *2dly*, If z be assumed the least of the propor-

Equations. tionals, the two roots of the equation are possible, but one of them only can be applied; which is 17.635 nearly; and the three proportionals are $17.635, 22.365$, and 28.365 , nearly, the roots of the equation being incommensurate.

In like manner may the limitations of the other question above mentioned be ascertained.

Though the preceding questions have been so contrived that the answers may be integers, yet in practice it will most commonly happen that they must be surds. When in any question the root of a number which is not a perfect square is to be extracted, it may be continued in decimals, by the common arithmetical rule, to any degree of accuracy which the nature of the subject may require.

Scholium.

An equation, in the terms of which two powers only of the unknown quantity are found, and such that the index of the one is double that of the other, may, by the preceding rules, be reduced to a pure equation, and may therefore be resolved by § 1. of this chapter.

Such an equation may generally be represented thus:

$$x^{2m} \pm ax^m = \pm b^n$$

Let $x^m = z$, then $z^2 \pm az = \pm b^n$

$$\text{And } x^m (=z) = \frac{a \pm \sqrt{a^2 \pm 4b^n}}{2}$$

$$\text{Therefore } x = \sqrt[m]{\frac{a \pm \sqrt{a^2 \pm 4b^n}}{2}}$$

Exam. 15. To find two numbers, of which the product is 100 , and the difference of their square roots 3 .

Let the less be x , the greater is

$$1 \quad \frac{100}{x}$$

By question

$$2 \quad \sqrt{x} - \sqrt{\frac{100}{x}} = 3$$

$$3 \quad 10 - x = 3\sqrt{x} = 3x^{\frac{1}{2}}$$

$$4 \quad x + 3x^{\frac{1}{2}} = 10$$

$$5 \quad x + 3x^{\frac{1}{2}} + \frac{9}{4} = 10 + \frac{9}{4} = \frac{49}{4}$$

$$6 \quad x^{\frac{1}{2}} + \frac{3}{2} = \pm \frac{7}{2} \text{ and } x^{\frac{1}{2}} = 2 \text{ or } -5$$

$$7 \quad x = 4 \text{ or } x = 25$$

If $x=4$, the other number is 25 ; and this is the proper solution, for x was supposed to be the least. In this case, indeed, the negative root of the equation being applied according to the rules for negative quantities, gives a positive answer to the question; and if $x=25$, the other number is 4 .

The same would have been got, by substituting in the general theorem $m=\frac{1}{2}$, $a=3$, and $b^n=10$; or, if the less number had been called x^2 , the equation would not have had fractional exponents.

CHAP. VI.

Of Indeterminate Problems.

It was formerly observed (Chap. III.), that if there are more unknown quantities in a question than equa-

Indeterminate Problems.

tions by which their relations are expressed, it is indetermined; or it may admit of an infinite number of answers. Other circumstances, however, may limit the number in a certain manner; and these are various, according to the nature of the problem. The contrivances by which such problems are resolved are so very different in different cases, that they cannot be comprehended in general rules.

Examp. 1. To divide a given square number into two parts, each of which shall be a square number.

There are two quantities sought in this question, and there is only one equation expressing their relation; but it is required also that they may be rational, which circumstance cannot be expressed by an equation: another condition therefore must be assumed, in such a manner as to obtain a solution in rational numbers.

Let the given square be a^2 ; let one of the squares sought be x^2 , the other is $a^2 - x^2$. Let $rx - a$ also be a side of this last square, therefore

$$r^2x^2 - 2rxa + a^2 = a^2 - x^2$$

By transp. $r^2x^2 + x^2 = 2rxa$

Divide by x $r^2x + x = 2ra$

Therefore $x = \frac{2ra}{r^2 + 1}$

And $rx - a = \left(\frac{2r^2a}{r^2 + 1} - a \right) \frac{r^2a - a}{r^2 + 1}$

Let r therefore be assumed at pleasure, and $\frac{2ra}{r^2 + 1}$, $\frac{r^2a - a}{r^2 + 1}$, which must always be rational, will be the sides of the two squares required.

Thus, if $a^2 = 100$; then if $r = 3$, the sides of the two squares are 6 and 8, for $36 + 64 = 100$.

Also let $a^2 = 64$. Then if $r = 2$, the sides of the squares are $\frac{32}{5}$ and $\frac{24}{5}$; and $\frac{1024}{25} + \frac{576}{25} = \frac{1600}{25} = 64$.

The reason of the assumption of $rx - a$ as a side of the square $a^2 - x^2$, is that being squared and put equal to this last, the equation manifestly will be simple, and the root of such an equation is always rational.

Examp. 2. To find two square numbers whose difference is given.

Let x^2 and y^2 be the square numbers, and a their difference.

Put $\frac{z+v}{2} = x$, and $\frac{z-v}{2} = y$

$$\frac{z^2 + 2zv + v^2}{4} = x^2$$

$$\frac{z^2 - 2zv + v^2}{4} = y^2$$

$$zv = (x^2 - y^2) = a.$$

If x and y are required only to be rational, then take v at pleasure, and $z = \frac{a}{v}$, whence x and y are known.

But if x and y are required to be whole numbers, take for z and v any two factors that produce a , and are both even or both odd numbers. And this is possible only where a is either an odd number greater than

1, or a number divisible by 4. Then $\frac{z+v}{2}$ and $\frac{z-v}{2}$ are the numbers sought. Indeterminate Problems:

For the product of two odd numbers is odd, and that of two even numbers is divisible by 4. Also, if z and v are both odd or both even, $\frac{z+v}{2}$ and $\frac{z-v}{2}$ must be integers.

Ex. 1. If $a = 27$, take $v = 1$, then $z = 27$; and the squares are 196 and 169. Or z may be 9 and $v = 3$, and then the squares are 36 and 9.

2. If $a = 12$, take $v = 2$, and $z = 6$; and the squares are 16 and 4.

Examp. 3. To find a sum of money in pounds and shillings, whose half is just its reverse.

Note. The reverse of a sum of money, as 8l. 12s. is 12l. 8s.

Let x be the pounds and y the shillings.

The sum required is $20x + y$

Its reverse is $20y + x$

Therefore $\frac{20x + y}{2} = 20y + x$

$$20x + y = 40y + 2x$$

$$18x = 39y$$

$$x : y :: (39 : 18 ::) 13 : 6$$

In this equation there are two unknown quantities; and, in general, any two numbers of which the proportion is that of 13 to 6 will agree to it.

But, from the nature of this question, 13 and 6 are the only two that can give the proper answer, viz. 13l. 6s. for its reverse 6l. 13s. is just its half.

The ratio of x and y is expressed in the lowest integral terms by 13 and 6; any other expression of it, as the next greater 26 and 12, will not satisfy the problem, as 12l. 26s. is not a proper notation of money in pounds and shillings.

CHAP. VII.

Demonstration of Theorems by Algebra:

ALGEBRA may be employed for the demonstration of theorems, with regard to all those quantities concerning which it may be used as an analysis; and from the general method of notation and reasoning, it possesses the same advantages in the one as in the other. The three first sections of this chapter contain some of the most simple properties of series which are of frequent use; and the last, miscellaneous examples of the properties of algebraical quantities and numbers.

I. *Of Arithmetical Series.*

Def. When a number of quantities increase or decrease by the same common difference, they form an arithmetical series.

Thus, $a, a + b, a + 2b, a + 3b$, &c. $x, x - b, x - 2b$, &c.

Also, 1, 2, 3, 4, 5, 6, &c. and 8, 6, 4, 2, &c.

Prop. In an arithmetical series, the sum of the first 3

Demonstration of Theorems.

and last terms is equal to the sum of any two intermediate terms, equally distant from the extremes.

Let the first term be a , the last x , and b the common difference; then $a+b$ will be the second, and $x-b$ the last but one, &c.

Thus, $a, a+b, a+2b, a+3b, a+4b, \&c.$
 $x, x-b, x-2b, x-3b, x-4b, \&c.$

It is plain, that the terms in the same perpendicular rank are equally distant from the extremes; and that the sum of any two in it is $a+x$, the sum of the first and last.

Cor. 1. Hence the sum of all the terms of an arithmetical series is equal to the sum of the first and last, taken half as often as there are terms.

Therefore if n be the number of terms, and s the sum of the series; $s = a + x \times \frac{n}{2}$. If $a=c$, then $s = \frac{nx}{2}$.

Cor. 2. The same notation being understood, since any term in the series consists of a , the first term, together with b taken as often as the number of terms preceding it, it follows, that $x = a + n-1 \times b$, and hence $s = 2a + n-1 \times b \times \frac{n}{2}$; or by multiplication, $s = \frac{2an + n^2b - nb}{2}$. Therefore from the first term, the common difference, and number of terms being given, the sum may be found.

Ex. Required the sum of 50 terms of the series 2, 4, 6, 8, &c.

$$s = \frac{2 \times 2 \times 50 + 50^2 \times 2 - 50 \times 2}{2} = \frac{5100}{2} = 2550.$$

Cor. 3. Of the first term, common difference, sum and number of terms, any three being given, the fourth may be found by resolving the preceding equation; a, b, s , and n , being successively considered as the unknown quantity. In the three first cases the equation is simple, and in the last it is quadratic.

II. Of Geometrical Series.

Def. When a number of quantities increase by the same multiplier, or decrease by the same divisor, they form a geometrical series. This common multiplier or divisor is called the *common ratio*.

Thus, $a, ar, ar^2, \&c.$ $a, \frac{a}{r}, \frac{a}{r^2}, \frac{a}{r^3}, \&c.$
 $1, 2, 4, 8, \&c.$

Prop. I. The product of the extremes in a geometrical series is equal to the product of any two terms, equally distant from the extremes.

Let a be the first term, y the last, r the common ratio: then the series is,

$$a, ar, ar^2, ar^3, ar^4, \&c.$$

$$y, \frac{y}{r}, \frac{y}{r^2}, \frac{y}{r^3}, \frac{y}{r^4}, \&c.$$

It is obvious, that any term in the upper rank is equally distant from the beginning as that below it

from the end; and the product of any two such is equal to ay , the product of the first and last.

Demonstration of Theorems.

Prop. II. The sum of a geometrical series wanting the first term, is equal to the sum of all but the last term multiplied by the common ratio.

For, assuming the preceding notation of a series, it is plain, that

$$ar + ar^2 + ar^3, \&c. \dots + \frac{y}{r^3} + \frac{y}{r^2} + \frac{y}{r} + y =$$

$$= r \times a + ar + ar^2, \&c. \dots + \frac{y}{r^2} + \frac{y}{r^3} + \frac{y}{r^2} + \frac{y}{r}$$

Cor. 1. Therefore s being the sum of the series,

$$s - y \times r = s - a. \text{ And } s = \frac{yr - a}{r - 1}$$

Hence s can be found from a, y , and r ; and any three of the four being given, the fourth may be found.

Cor. 2. Since the exponent of r in any term is equal to the number of terms preceding it; hence in the last term its exponent will be $n-1$; the last term, therefore, $y = ar^{n-1}$, and $s = \frac{ar^n - a}{r - 1} = a \times \frac{r^n - 1}{r - 1}$. Hence of these four; s, a, r, n , any three being given, the fourth may be found by the solution of equations. If n is not a small number, the cases of this problem will be most conveniently resolved by logarithms; and of such solutions there are examples in the appendix to this part.

Cor. 3. If the series decreases, and the number of terms is infinite; then, according to this notation, a the least term will be 0, and $s = \frac{yr}{r - 1}$, a finite sum.

Ex. Required the sum of the series $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \&c.$ to infinity.

Here $y = 1$, and $r = 2$. Therefore $s = \frac{1 \times 2}{2 - 1} = 2$.

What are called in arithmetic *repeating* and *circulating decimals*, are truly geometrical decreasing serieses, and therefore may be summed by this rule.

Thus .333, &c. $= \frac{3}{10} + \frac{3}{100} + \&c.$ is a geometrical series in which $y = \frac{3}{10}$ and $r = 10$; therefore $s = \frac{yr}{r - 1} = \frac{3 \times 10}{10 \times 10 - 1} = \frac{1}{3}$.

Thus, also, .2424, &c. $= \frac{8}{33}$, for here $y = \frac{24}{100}$ and $r = 100$; therefore $s = \frac{24 \times 100}{100 \times 100 - 1} = \frac{24}{99} = \frac{8}{33}$.

III. Of Infinite Series.

It was observed (Chap. I. and IV.), that in many cases, if the division and evolution of compound quantities be actually performed, the quotients and roots can only be expressed by a series of terms, which may be continued *ad infinitum*. By comparing a few of the first terms, the law of the progression of such a series

Demonstration of Theorems.

ries will frequently be discovered, by which it may be continued without any farther operation. When this cannot be done, the work is much facilitated by several methods; the chief of which is that by the binomial theorem.

of a^2+x^2 , consists of a , together with a series of fractions; in the numerators of which are the even powers of x , and in the denominators the odd powers of a . The numeral coefficients of the terms of the whole series, as deduced by the theorem, will be: $1, +\frac{1}{2 \times 1}$, $-\frac{1 \times 1}{2.2 \times 1.2}$, $+\frac{1 \times 1.3}{2.2.2 \times 1.2.3}$, $-\frac{1 \times 1.3.5}{2.2.2.2 \times 1.2.3.4}$, &c.

Demonstration of Theorems.

THEOREM. Any binomial (as $a+b$) may be raised to any power (m) by the following rules.

1. From inspecting a table of the powers of a binomial obtained by multiplication, it appears that the terms without their coefficients are $a^m, a^{m-1}b, a^{m-2}b^2, a^{m-3}b^3$, &c.

2. The coefficients of these terms will be found by the following rule.

Divide the exponent of a in any term by the exponent of b increased by 1, and the quotient multiplied by the coefficient of that term will give the coefficient of the next following term.

This rule is found, upon trial in the table of powers, to hold universally. The coefficient of the first terms is always 1. and by applying the general rule now proposed, the coefficients of the terms in order will be as follows: $1, m, m \times \frac{m-1}{2}, m \times \frac{m-1}{2} \times \frac{m-2}{3}$, &c. They may be more conveniently expressed thus: $1, Am, B \times \frac{m-1}{2}, C \times \frac{m-2}{3}, D \times \frac{m-3}{4}$, &c. the capitals denoting the preceding coefficient. Hence $(a+b)^m = a^m +$

$Ama^{m-1}b + B \times \frac{m-1}{2} \times a^{m-2}b^2 + C \times \frac{m-2}{3} a^{m-3}b^3$, &c. This is the celebrated binomial theorem. It is deduced here by induction only; but it may be rigidly demonstrated, though upon principles which do not belong to this place.

Cor. 1. As m may denote any number, integral or fractional, positive or negative; hence the division, involution, and evolution, of a binomial, may be performed by this theorem.

Ex. 1. Let $m = \frac{1}{2}$, then $\sqrt{a+b} = a^{\frac{1}{2}} + \frac{1}{2}a^{-\frac{1}{2}}b + \frac{1}{4} \times a^{-\frac{3}{2}}b^2 +$, &c. This being applied to the extraction of the square root of a^2+x^2 (by inserting a^2 for a and x^2 for b), the same series results as formerly (Chap. IV.)

Ex. 2. If $\frac{1}{1-r}$ is to be turned into an infinite series, since $\frac{1}{1-r} = 1 \times (1-r)^{-1}$, let $a=1, b=-r$, and $m=-1$; and the same series will arise as was obtained by division (Chap. I.)

In like manner $\frac{r^2}{\sqrt{2rz-z^2}} (=r^2 \times \sqrt{2rz-z^2})^{-\frac{1}{2}}$ may be expressed by an infinite series, by supposing $a=2rz, b=-z^2$, and $m=-\frac{1}{2}$, and then multiplying that series by r^2 .

Cor. 2. This theorem is useful also in discovering the law of an infinite series produced by division or evolution. Thus, the series expressing the square root

of a^2+x^2 , consists of a , together with a series of fractions; in the numerators of which are the even powers of x , and in the denominators the odd powers of a . The numeral coefficients of the terms of the whole series, as deduced by the theorem, will be: $1, +\frac{1}{2 \times 1}$, $-\frac{1 \times 1}{2.2 \times 1.2}$, $+\frac{1 \times 1.3}{2.2.2 \times 1.2.3}$, $-\frac{1 \times 1.3.5}{2.2.2.2 \times 1.2.3.4}$, &c. The point being used (as it often is) to express the product of the numbers between which it is placed. The law of continuation is obvious; and the series may be carried on to any number of terms, without using the theorem. Hence also the coefficient of the n th term is $\frac{1 \times 1.3.5 \text{ \&c. } \dots (n-2 \text{ terms})}{2^{n-1} \times 1.2.3.4 \text{ \&c. } (n-1)}$; and it is $+$ if n is an even number, and $-$ if n is odd.

Note. If the binomial is $a+b$, the signs of the terms of any power are all positive; if it is $a-b$, the alternate terms are negative, beginning at the second. This theorem may be applied to quantities which consist of more than two parts, by supposing them distinguished into two, and then substituting for the powers of these compound parts their values, to be obtained also, if required, from the theorem. Thus, $\sqrt{a+b+c^2} = \sqrt{a+b+c^2}$.

Scholium.

An infinite series may itself be multiplied or divided by another; it may be involved or evolved; and various other operations may be performed upon it which are necessary in the higher parts of algebra. The methods for finding the sum depend upon other principles.

IV. Properties of Numbers.

THEOR. I. The sum of two quantities multiplied by their difference is equal to the difference of their squares.

Let the quantities be represented by a and b , then $a+b \times a-b = a^2-b^2$, as appears by performing the operation.

Cor. If a and b be any two quantities of which the sum may be denoted by s , the difference by d , and their product by p , then the following propositions will be true.

- 1. $a^2+b^2 = s^2 - 2p$
- 2. $a^2-b^2 = sd$
- 3. $a^3+b^3 = s^3 - 3ps$
- 4. $a^3-b^3 = s^2d - dp$
- 5. $a^4+b^4 = s^4 - 4ps^2 + 2p^2$
- 6. $a^4-b^4 = s^3d - 2sdp$, &c.

It is unnecessary to express these propositions in words, and the demonstrations are very easy, by raising $a+b$ to certain powers, and making proper substitutions.

THEOR. II. The sum of any number of terms (n) of the odd numbers 1, 3, 5, &c. beginning with 1, is equal to the square of that number (n).

In the rule for summing an arithmetical series, let $a=1, b=2$, and $n=n$, and the sum of this series will be $s = \frac{2an+n^2b-nb}{2} = \frac{2n^2}{2} = n^2$. Q. E. D.

THEOR.

Demonstration of Theorems.

THEOR. III. *The difference of any two square numbers is equal to the sum of the two roots, together with twice the sum of the numbers in the natural scale between the two roots.*

Let the one number be p , and the other $p+n$, the intermediate numbers are $p+1, p+2, \dots$ &c. $p+n-1$. The difference of the squares of the given numbers is $2pn+n^2$; the sum of the two roots is $2p+n$, and twice the sum of the series $p+1+p+2 \dots$ &c. $p+n-1$ is (by Cor. 1. 1st Sect. of this Chap.) $2s=2p+n \times n-1$, viz. the sum of the first and last multiplied by the number of terms, and it is plain that $2p+n+2p+n \times n-1=2pn+n^2$. Therefore, &c.

Lem. 1. Let r be any number, and n any integer, r^n-1 is divisible by $r-1$.

The quotient will be $r^{n-1}+r^{n-2}, \dots$ &c. till the index of r be 0, and then the last term of it will be 1; for if this series be multiplied by the divisor $r-1$, it will produce the dividend r^n-1 . It will appear also by performing the division, and inserting for n any number.

Lem. 2. Let r be any number, and n any integer odd number, r^n+1 is divisible by $r+1$. Also, if n is any even number, r^n-1 is divisible by $r+1$.

The quotient in both cases is $r^{n-1}-r^{n-2}+r^{n-3}$ &c. till the exponent of r be 0, and the last term $r^0=1$. If this series consist of an odd number of terms, and be multiplied by $r+1$ the divisor, the product is r^n+1 the dividend. If the series consist of an even number of terms, the product is r^n-1 ; but it is plain that the number of terms will be odd only when n is odd, and even only when n is even. The conclusion will be manifest by performing the division.

Lem. 3. If r is the root of an arithmetical scale, any number in that scale may be represented in the following manner, a, b, c, \dots being the coefficients or digits, $a+br+cr^2+dr^3+er^4, \dots$

THEOR. IV. *If from any number in the general scale now described, the sum of its digits be subtracted, the remainder is divisible by $r-1$.*

The number is $a+br+cr^2+dr^3, \dots$ and the sum of the digits is $a+b+c+d, \dots$. Subtracting the latter from the former, the remainder is $br-b+cr^2-c+dr^3-d, \dots = br \times r-1+c \times r^2-1+d \times r^3-1, \dots$. But (by Lem. 1.) r^n-1 is divisible by $r-1$, whatever integer number n may be, and therefore any multiple of r^n-1 is also divisible by $r-1$: Hence each of the terms, $b \times r-1, c \times r^2-1, \dots$ is divisible by $r-1$, and therefore the whole is divisible by $r-1$.

Cor. 1. Any number, the sum of whose digits is divisible by $r-1$, is itself divisible by $r-1$. Let the number be called N , and the sum of the digits D ; then by this prop. $N-D$ is divisible by $r-1$, and D is supposed to be divisible by $r-1$; therefore it is plain that N must also be divisible by $r-1$.

Cor. 2. Any number, the sum of whose digits is divisible by an aliquot part of $r-1$, is also divisible by that aliquot part. For, let N and D denote as before; and since $N-D$ (Theor. 4.) is divisible by $r-1$, it is also divisible by an aliquot part of $r-1$; but D is divisible by an aliquot part of $r-1$, therefore N is also divisible by that aliquot part.

Cor. 3. This theorem, with the corollaries, relates to any scale whatever. It includes therefore the well known property of 9 and of 3 its aliquot part, in the decimal scale; for, since $r=10, r-1=9$.

THEOR. V. *In any number, if from the sum of the coefficients of the odd powers of r the sum of the coefficients of the even powers be subtracted, and the remainder added to the number itself, the sum will be divisible by $r+1$.*

In the number $a+br+cr^2+dr^3+er^4+fr^5, \dots$ the sum of the coefficients of the odd powers of r is $b+d+f, \dots$ &c. the sum of the coefficients of the even powers of r is $a+c+e, \dots$ &c. If the latter sum be subtracted from the former, and the remainder added to the given number, it makes $br+b+cr^2-c+dr^3+d+er^4-e+fr^5+f, \dots = b \times r+1+c \times r^2-1+d \times r^3+1+e \times r^4-1+f \times r^5+1, \dots$. But (by Lem. 2.) $r+1, r^2-1, r^3+1, \dots$ &c. are each divisible by $r+1$, and therefore any multiples of them are also divisible by $r+1$, hence the whole number is divisible by $r+1$.

Cor. 1. If the difference of the sum of the even digits, and the sum of the odd digits of any number be divisible by $r+1$, the number itself is divisible by $r+1$.

Let the sum of the even digits (that is, the coefficients of the odd powers of r) be D , the sum of the odd digits be d , and let the number be N . Then by the theorem $N+D-d$ is divisible by $r+1$, and it is supposed that $D-d$ is divisible by $r+1$; therefore N is divisible by $r+1$.

Cor. 2. In like manner, if $D-d$ is divisible by an aliquot part of $r+1$, N will be divisible by that aliquot part.

Cor. 3. If a number want all the odd powers of r , or if it want all the even powers of r , and if the sum of its digits be divisible by $r+1$, that number is divisible by $r+1$.

Cor. 4. In the common scale $r+1=11$, which therefore will have the properties mentioned in this theorem, and the corollaries. Thus, in the number 64,834, the sum of the even digits is 7, the sum of the odd digits is 18, and the difference is 11, a number divisible by 11, the given number therefore (Cor. 1.) is divisible by 11. Thus also, the sum of the digits of 704308 is divisible by 11, and therefore the number is divisible by 11. (Cor. 3.)

Scholium.

These theorems relate to any scale whatever, and therefore the properties of $r-1$ in Theor. 4. would in a scale of eight belong to seven, and those in Theor. 5. to nine. If twelve was the root of the scale, the former properties would belong to eleven, and the latter to thirteen.

APPENDIX to PART I.

ALGEBRA may be employed in expressing the relations of magnitude in general, and in reasoning with regard to them. It may be used in deducing not only the relations of number, but also those of extension, and hence those of every species of quantity expressible by numbers or extended magnitudes. In this appendix are mentioned some examples of its application to other parts of mathematics, to physics, and to the

Applica-
tion to Geo-
metry.

the practical calculations of business. The principles and suppositions peculiar to these subjects, which are necessary in directing both the algebraical operations, and the conclusions to be drawn from them, are here assumed as just and proper.

I. Application of Algebra to Geometry.

Algebra has been successfully applied to almost every branch of mathematics; and the principles of these branches are often advantageously introduced into algebraical calculations.

The application of it to *geometry* has been the source of great improvement in both these sciences; on account of its extent and importance it is here omitted, and the principles of it are more particularly explained in the third part of these elements.

In this place shall be given an example of the use of logarithms in resolving certain algebraical questions.

Note. When logarithms are used, let (*l.*) denote the logarithm of any quantity before which it is placed.

Ex. To find the number of terms of a geometrical series, of which the sum is 511, the first term 1, and the common ratio 2.

From sect. 2. chap. 6. it appears that $s = \frac{ar^n - a}{r - 1}$,

and in this problem, *s*, *r*, and *a* are given, and *n* is to be found. By reducing the equation $r^n = \frac{s \times r - 1 + a}{a}$

and from the known property of logarithms $n \times l.r = \frac{l.s \times r - 1 + a - l.a}{l.r}$, and $n = \frac{l.s \times r - 1 + a - l.a}{l.r}$. But

here $s = 511$, $a = 1$, $r = 2$, and $n = \frac{l.512}{l.2} =$

$$\frac{2.7092700}{0.3010300} = 9.$$

In like manner may any such equation be resolved, when the only unknown quantity is an exponent, and when it is the exponent only of one quantity.

Ex. 2. An equation of the following quadratic form $a^2 \pm 2ba^x = \pm c$ may be resolved by logarithms. If,

by scholium of Chap. V. $a^x = \pm b \pm \sqrt{b^2 \pm c}$. And then *x* is discovered in the same manner as in the preceding example. Thus, let $a = 2$, $b = 10$, and $c = 96$

and the equation $2^{2x} - 20 \times 2^x = -96$. If, $2^x = 10 \pm$

$\sqrt{4} = 12$ or 8. If $2^x = 8$ then $x = \frac{l.8}{l.2} = 3$ and $2^6 -$

$20 \times 2^3 = -96$ is a true equation. If $2^x = 12$, then $x = \frac{l.12}{l.2} = \frac{1.0791812}{0.3010300} = 3.5849$, and this number being

inserted for *x* in the given equation, by means of logarithms, will answer the conditions.

Ex. 3. The sum of 2000*l.* has been out at interest for a certain time, and 500*l.* has been at interest double of that time, the whole arrear now due reckoning 4*p. r cent.* compound interest, is 6000*l.* What were the times?

By the rules in the third part of this appendix for compound interest, it is plain that if $R = 1.04$, and the time at which the 2000*l.* is at interest be *x*, the arrear of it will be $2000 \times R^x$. The arrear of the 500*l.* is $500 \times R^{2x}$, hence $500 \times R^{2x} + 2000 \times R^x = 6000$. This

N^o 11.

resolved gives $R^x = 2$ and $x = \frac{l.2}{l.R} = 17.67$, + nearly, Application to Physics. that is, 17 years and 8 months nearly, and the double is 35 years and 4 months; which answer the conditions.

II. Application of Algebra to Physics.

Physical quantities which can be divided into parts, that have proportions to each other, the same as the proportions of lines to lines, or of numbers to numbers, may be expressed by lines and numbers, and therefore by algebraical quantities. Hence these mathematical notations may be considered as the measures of such physical quantities; they may be reasoned upon according to the principles of algebra, and from such reasonings, new relations of the quantities which they represent may be discovered.

In those branches of natural philosophy, therefore, in which the circumstances of the phenomena can be properly expressed by numbers, or geometrical magnitudes, algebra may be employed, both in promoting the investigation of physical laws by experience, and also in deducing the necessary consequences of laws investigated and presumed to be just.

It is to be observed likewise, that if various hypotheses be assumed concerning physical quantities, without regard to what takes place in nature, their consequences may be demonstratively deduced, and thus a science may be established, which may be properly called *mathematical*. The use of algebra in this science, which is sometimes called *Theoretical Mechanics*, is obvious from the principles already laid down.

In conducting these inquiries, it is to be observed, that, for the sake of brevity, the language of algebraical operations is often used with regard to physical quantities themselves; though it is always to be understood, that, in strict propriety, it can be applied only to the mathematical notations of these quantities.

Before illustrating this application of algebra by examples, it may be proper to explain a method of stating the proportion of variable quantities, and reasoning with regard to it, which is of general use in natural philosophy.

1. Of the Proportion of variable Quantities.

Mathematical quantities are often so connected, that when the magnitude of one is varied, the magnitudes of the others are varied, according to a determined rule. Thus, if two straight lines, given in position, intersect each other; and, if a straight line, cutting both, moves parallel to itself, the two segments of the given lines between their intersection and the moving line; however varied, will always have the same proportion. Thus also, if an ordinate to the diameter of a parabola move parallel to itself, the absciss will be increased or diminished in proportion as the square of the ordinate is increased or diminished.

In like manner may algebraical quantities be connected. If *x*, *y*, *z*, &c. represent any variable quantities, while *a*, *b*, *c*, represent such as are constant or invariable, then an equation containing two or more variable quantities, with any number of constant quantities, will exhibit a relation of variable quantities, similar to those already mentioned. Thus, if $ax = by$, then $x : y :: b : a$, that is, *x* has a constant proportion to *y*,

in

Of Equations. in whatever way these two quantities may be varied. Likewise, if $xy^2 = a^2b$, then $y^2 : a^2 :: b : x$, or $y^2 : \frac{1}{x} :: a^2$

$X = \frac{a^2}{bY}$. For since $X = \frac{1}{Y}$ (Def. 3.) $X : x :: \frac{1}{Y} : \frac{1}{y}$, it follows, (Chap. II.) that $X : x :: \frac{a^2}{bY} : \frac{a^2}{by}$, therefore

(Def. 4.) $X = \frac{a^2}{bY}$

$: \frac{1}{b}$, that is, y^2 has a constant proportion to the reciprocal of x , or y^2 is increased in the same proportion as x is diminished, and conversely. It is necessary to premise the following definitions.

Definitions.

Let there be any number of variable quantities, X, Y, Z, V , &c. connected in such a manner, that when X becomes x, Y, Z, V , &c. becomes respectively y, z, v , &c. And let a, b, c , &c. represent any constant quantities, whether given or unknown. Then

1. If two variable quantities X and Y are so connected, that whatever be the values of x and $y, X : x :: Y : y$, this proportion is expressed thus, $X = Y$, and X is said to be *directly as Y*, or shortly, X is said to be *as Y*.

2. If two variable quantities X and Y are so connected, that $X : x :: y : Y$, or $X : x :: \frac{1}{Y} : \frac{1}{y}$, their relation is thus expressed, $X = \frac{1}{Y}$; and X is said to be *inversely*, or *reciprocally as Y*.

3. If X, Y, Z , are three variable quantities, so connected that $X : x :: YZ : yz$, their relation is so expressed, $X = YZ$, and X is said to be *directly as Y and Z, jointly*; or X is said to be *as Y and Z*.

4. If any number of variable quantities as X, Y, Z, V , &c. are so connected, that $XY : xy :: \frac{YZ}{V} : \frac{yz}{v}$; then $XY = \frac{YZ}{V}$, and XY is said to be *directly as YZ*,

and *inversely as V*, or more explicitly, X and Y *jointly*, are *directly as Y and Z jointly*, and *inversely as V*.

In like manner are other combinations of variable quantities denoted and expressed.

It is to be observed also, the same definitions take place, when the variable quantities are multiplied or divided by any constant quantities. Thus, if $aX : ax :: \frac{b}{Y} : \frac{b}{y}$ then $aX = \frac{b}{Y}$, &c.

5. Let the preceding notation of proportion be called a *proportional equation* (A), the equations formerly treated of being in this place, for the sake of distinction, called *absolute*.

Cor. Every absolute equation, containing more than one variable quantity, may be considered as a proportional equation; and in a proportional equation, if at any particular corresponding values of the variable quantities, the equation becomes absolute, it will be universally absolute.

Prop. 1. If one side of a proportional equation be either multiplied or divided by any constant quantity, it will continue to be true. Thus, if $X = \frac{1}{Y}$, then

Prop. 2. If the two sides of a proportional equation be both multiplied, or both divided by the same quantity, it will continue to be true.

1st. If the quantity be constant, it is manifest from Prop. 1.

2^d. If the quantity be variable, let $X = Y$, and Z a variable quantity, then $XZ = YZ$. For, since $X = Y$, (Def. 2.) $X : x :: Y : y$; multiply the antecedents by Z , and the consequents by z , then $XZ : xz :: YZ : yz$, therefore (Def. 5.) $XZ = YZ$. In like manner, if $X = Y, \frac{X}{Z} = \frac{Y}{Z}$.

Cor. Any variable quantity, which is a factor of one side of a proportional equation, may be made to stand alone. Thus, if $XY = \frac{Z}{V}$, then $X = \frac{Z}{YV}$; also, $Z = XYV$; and $Y = \frac{Z}{XV}$, and also $V = \frac{Z}{XY}$, &c. Hence, also, if one side of a proportional equation be divided by the other, the quotient is a constant quantity, viz. 1.

Prop. 3. If two proportional equations have a common side, the remaining two sides will form a proportional equation. Also, that common side will be as the sum or difference of the other two.

Thus, if $X = Y$, and $Y = Z$, then $X = Z$. For $X : x :: Y : y$, and $Y : y :: Z : z$, therefore multiplying these ratios, $XY : xy :: YZ : yz$, and by dividing antecedents and consequents, $X : x :: Z : z$, therefore (Def. 2.) $X = Z$.

Likewise, if $X = Y$, and $Y = Z, Y = X \pm Z$. For, since $X : x :: Y : y :: Z : z$. (Chap. II.) $Y : y :: X \pm Z : x \pm z$, therefore Def. 5. $Y = X \pm Z$.

Cor. Hence, one side of a proportional equation will be as the sum, or as the difference of the two sides; and the sum of the two sides will be as their difference. Thus, if $X = Y + Z$, then $X = X + Y + Z$ and $X = X - Y - Z$, and also $X + Y + Z = X - Y - Z$.

Prop. 4. If the two sides of a proportional equation be respectively multiplied or divided by the two sides of any other proportional equation, the products or quotients will form a proportional equation.

Thus, if $X = Y$, and $Z = V$, then $XZ = YV$. For since $X : x :: Y : y$, and $Z : z :: V : v$, by multiplying these proportions (Chap. I. II.) $XZ : xz :: YV : yv$, therefore (Def. 5.) $XZ = YV$. In like manner in the case of division.

Cor. 1. The two sides of a proportional equation may be raised to any power, or any root may be extracted out of both, and the equation will continue to be true.

Thus, if $X = Y$, then $X^m = Y^m$; for since $X = Y, X : x$

(A) These terms are used only with a view to give more precision to the ideas of beginners. In order to avoid the ambiguity in the meaning of the sign =, some writers employ the character \propto , to denote constant proportion; but this is seldom necessary, as the quantities compared are generally of different kinds, and the relation expressed is sufficiently obvious. See Emerson's Mathematics, vol. I.

Of Equations.

$X:x::Y:y$, and therefore $X^m:x^m::Y^m:y^m$; therefore $X^m=Y^m$. And, if $X=r$, also $X^m=r^m$.

Cor. 2. If two proportional equations have a common side, that side will be as the square root of the product of the other two. Thus if $X=Y$, and $Y=Z$, by this Prop. $Y^2=XZ$, and (Cor. 1.) $Y=\sqrt{XZ}$. Hence also, in this case, $\sqrt{XZ}=X\pm Z$; for (Prop. 3.) $Y=X\pm Z$.

Cor. 3. If one side of a proportional equation be a factor of a side of another proportional equation, the remaining side of the former may be inserted in the latter, in place of that factor. Thus, if $X=ZY$, and $Z=\frac{r}{p}$, then $X=\frac{r}{p}Y$, as appears by multiplying the two equations, and dividing by Z .

Prop. 5. Any proportional equation may be made absolute, by multiplying one side by a constant quantity.

Thus, if $X=Y$, then let two particular corresponding values of these variable quantities be assumed as constant, and let them be a and b , then $X:a::Y:b$, and $Xb=aY$, or $X=Y\times\frac{a}{b}$, an absolute equation.

Scholium.

1. If there be two variable physical quantities, either of the same, or of different kinds, which are so connected, that when the one is increased or diminished, the other is increased or diminished in the same proportion; or, if the magnitudes of the one, in any two situations, have the same ratio to each other, as the magnitudes of the other in the corresponding situations, the relation of the mathematical measure of these quantities may be expressed by a proportional equation, according to Def. 1.

2. If two variable physical quantities be so connected, that the one increases in the same proportion as the other is diminished, and conversely; or, if the magnitudes of the one, in any two situations, be reciprocally proportional to the magnitudes of the other, in the corresponding situations, the relation of their measures may be expressed by a proportional equation, according to Def. 2.

3. If three variable physical quantities are so connected, that one of them is increased or diminished, in proportion as both the others are increased or diminished; or, if the magnitudes of one of them, in any two situations, have a ratio which is compounded of the ratios of the magnitudes of the other two, in the corresponding situations; the relation of the measures of these three may be expressed by a proportional equation, according to Def. 3.

4. In like manner may the relations of other combinations of physical quantities be expressed according to Def. 4. And when these proportional equations are obtained, by reasoning with regard to them, according to the preceding propositions, new relations of the physical quantities may be deduced.

2. *Examples of Physical Problems.*

The use of algebra, in natural philosophy, may be properly illustrated by some examples of physical problems. The solution of such problems must be derived from known physical laws, which, though ultimately

founded on experience, are here assumed as principles, and reasoned upon mathematically. The experiments by which the principles are ascertained admit of various degrees of accuracy; and on the degree of physical accuracy in the principles will depend the physical accuracy of the conclusions mathematically deduced from them. If the principles are inaccurate, the conclusions must, in like manner, be inaccurate; and, if the limits of inaccuracy in the principles can be ascertained, the corresponding limits, in the conclusions derived from them, may likewise be calculated.

Examp. 1. Let a glass tube, 30 inches (a) long, be filled with mercury, excepting 8 inches (b); and let it be inverted as in the Toricellian experiment, so that the 8 inches of common air may rise to the top: It is required to find at what height the mercury will remain suspended, the mercury in the barometer being at that time 28 inches (d) high.

The solution of this problem depends upon the following principles:

1. The pressure of the atmosphere is measured by the column of mercury in the barometer; and the elastic force of the air, in its natural state, which resists this pressure, is therefore measured by the same column.

2. In different states, the elastic force of the air is reciprocally as the spaces which it occupies.

3. In this experiment, the mercury which remains suspended in the tube, together with the elastic force of the air in the top of it, being a counterbalance to the pressure of the atmosphere, may therefore be expressed by the column of mercury in the barometer.

Let the mercury in the tube be x inches, the air in the top of it occupies now the space $a-x$; it occupied formerly b inches, and its elastic force was d inches of mercury: Now, therefore, the force must be ($a-x:b::d:$).

$\frac{bd}{a-x}$ inches. (2.) Therefore (3.) $x + \frac{bd}{a-x} = d$.

This reduced, and putting $a+d=2m$ the equation is $x^2-2mx=bd-ad$.

This resolved gives $x=m\pm\sqrt{m^2+bd-ad}$.

In numbers - - $x=44$ or 14 .

One of the roots 44 is plainly excluded in this case, and the other, 14, is the true answer. If the column of mercury x , suspended in the tube, were a counterbalance to the pressure of the atmosphere, expressed by the height of the barometer d , together with the measure of the elastic force of b inches of common air in the space $x-a$, that is, if $x=d+\frac{bd}{x-a}$ or $x-\frac{bd}{x-a}=d$, the equation will be the same as before, and the root 44 would be the true answer. But the experiment in this question does not admit of such a supposition.

Examp. 2. The distance of the earth and moon (d), and their quantities of matter (t, l), being given, to find the point of equal attraction between them.

Let the distance of the point from the earth be x : Its distance from the moon will be therefore $d-x$. But gravitation is as the matter directly, and as the square of the distance inversely; therefore the earth's attraction is as $\frac{t}{x^2}$; and the moon's attraction is as $\frac{l}{(d-x)^2}$. But these are here equal; therefore,

Of Equations.

$$\frac{t}{x^2} = \frac{l}{d-x^2} \text{ and } \frac{\sqrt{t}}{x} = \frac{\sqrt{l}}{d-x}$$

This equation reduced gives $x = \frac{d\sqrt{t}}{\sqrt{t} + \sqrt{l}}$

Or mult. numerator and denominator by $\sqrt{t} - \sqrt{l}$ } $x = \frac{dt - d\sqrt{tl}}{t-l}$

In round numbers, let $d=60$ semidiameters of the earth, $t=40$, $l=1$, then $x=52$ semidiameters nearly. There is another point beyond the moon at which the attractions are equal, and it would be found by putting the square root of $d-x^2$ to be $x-d$, which, in this case, would be a positive quantity; and then $x = \frac{dt + d\sqrt{tl}}{t-l} = 72$ nearly. If the quantities had been multiplied before extracting the square roots, the affected quadratic would have given the same two roots.

Examp. 3. Let a stone be dropt into an empty pit; and let the time from the dropping of it to the hearing the sound from the bottom be given: To find the depth of the pit.

Let the given time be a ; let the fall of a heavy body in the 1st second of time (16.122 feet) be b : also, let the motion of sound in a second (1142 feet) be c .
 Let the time of the stone's fall be x
 The time in which the found of it moves to the top is $a-x$
 The descent of a falling body is as the square of the time, therefore the depth of the pit is ($1^2 : x^2 :: b :$) bx^2
 The depth from the motion of found is also $ca - cx$
 Therefore 3 and 4 $bx^2 = ca - cx$

This equation being resolved, gives the value of x , and from it may be got bx^2 or $ca - cx$, the depth of the pit.

If the time is 10'', then $x=8.885$ nearly, and the depth is 1273 feet.

There are several circumstances in this problem which render the conclusion inaccurate.

1. The values of c and b , on which the solution is founded, are derived from experiments, which are subject to considerable inaccuracies.
2. The resistance of the air has a great effect in retarding the descent of heavy bodies, when the velocity becomes so great as is supposed in this question; and this circumstance is not regarded in the solution.
3. A small error, in making the experiment to which this question relates, produces a great error in the conclusion. This circumstance is particularly to be attended to in all physical problems; and, in the present case, without noticing the preceding imperfections, an error of half a second, in estimating the time, makes an error of above 100 feet in the expression of the depth of the pit.

III. Of Interest and Annuities.

The application of algebra to the calculation of interests and annuities, will furnish proper examples of its use in business. Algebra cannot determine the propriety or justice of the common suppositions on which these calculations are founded, but only the necessary conclusions resulting from them.

Notation.

In the following theorems let p denote any principal sum of which 1 l. is the unit, t the time during which it bears interest, of which one year shall be the unit, r the rate of interest of 1 l. for one year, and let s be the amount of the principal sum p with its interest for the time t at the rate r .

I. Of Simple Interest.

$s = p + ptr$, and of these four, s, p, t, r , any three being given, the fourth may be found by resolving a simple equation.

The foundation of the canon is very obvious; for the interest of 1 l. in one year is r , for t years it is tr , and for p pounds it is ptr ; the whole amount of principal and interest must therefore be $p + ptr = s$.

II. Of Compound Interest.

When the simple interest at the end of every year is supposed to be joined to the principal sum, and both to bear interest for the following year, money is said to bear compound interest. The same notation being used, let $1+r=R$. Then $s = pR^t$.

For the simple interest of 1 l. in a year is r , and the new principal sum therefore which bears interest during the second year is $(1+r)R$; the interest of R for a year is rR , and the amount of principal and interest at the end of the 2d year, is $R + rR = R \times 1 + r = R^2$. In like manner, at the end of the 3d year it is R^3 , and at the end of t years it is R^t , and for the sum p it is $pR^t = s$.

Cor. 1. Of these four p, R, t, s , any three being given the 4th may be found. When t is not very small, the solution will be obtained most conveniently by logarithms. When R is known r may be found, and conversely.

Ex. If 500 l. has been at interest for 21 years, the whole arrear due, reckoning $4\frac{1}{2}$ per cent. compound interest, is 1260.12 l. or 1260 l. 2s. 5d. In this case $p=500$, $R=1.045$ and $t=21$ and $s=1260.12$, and any one of these may be derived by the theorem from the others being known. Thus, to find s ; $l.R^t = t \times l.R = 21 \times 0.0191163 = 0.4014423$, therefore $R^t = 2.520242$ and $s = (pR^t) = 500 \times 2.520242 = 1260.121$.

Cor. 2. The present worth of a sum (s) in reversion that is payable after a certain time t is found thus. Let the present worth be x , then this money improved by compound interest during t produces xR^t , which must be equal to s , and if $xR^t = s$, $x = \frac{s}{R^t}$.

Cor. 3. The time in which a sum is doubled at compound interest will be found thus. $pR^t = 2p$ and $R^t = 2$ and $t = \frac{l. 2}{l. R}$; thus, if the rate is 5 per cent. $r=.05$ and

$$\frac{l. 2}{l. 1.05} = \frac{0.3010300}{0.0211893} = 14.2066, \text{ that is } 14 \text{ years and } 75 \text{ days nearly.}$$

Scholium.

Many other suppositions might be made with regard to the improvement of money by compound interest. The interest might be supposed to be joined to the capital, and along with it to bear interest at the end of

Of Equations.

every month, at the end of every day, or even at the end of every instant, and suitable calculations might be formed; but these suppositions, being seldom used in practice, are omitted.

found only by resolving an affected equation of the t order.

Of Equations.

III. Of Annuities.

An annuity is a payment made annually for a certain term of years, and the chief problem with regard to it is, 'to determine its present worth.' The supposition on which the solution proceeds is, that the money received by the seller, being improved by him in a certain manner during the continuance of the annuity, amounts to the same sum as the several payments received by the purchaser, improved in the same manner. The suppositions with regard to the improvement may be various. What is called the *method of simple interest*, in which simple interest only is reckoned upon the purchase-money, and simple interest on each annuity from the time of payment, is so manifestly unequitable, as to be universally rejected; and the supposition which is now generally admitted in practice, is the highest improvement possible on both sides, viz. by compound interest. As the taking compound interest is prohibited by law, the realizing of this supposed improvement requires punctual payment of interest, and therefore the interest in such calculations is usually made low. Even with this advantage, it can hardly be rendered effectual in its full extent; it is however universally acquiesced in, as the most proper foundation of general rules; and when peculiar circumstances require any different hypothesis, a suitable calculation may be made.

Let then the annuity be called a , and let p be the present worth of it or purchase-money, t the time of its continuance, and let the other letters denote as formerly.

The seller, by improving the price received p , at compound interest, at the time the annuity ceases, has pR^t .

The purchaser is supposed to receive the first annuity a at the end of the first year, which is improved by him for $t-1$ years; it becomes therefore (Th. 2.) aR^{t-1} .

He receives the 2d annuity at the end of the 2d year, and when improved $t-2$, it becomes aR^{t-2} .

The third annuity becomes aR^{t-3} , &c.

The last annuity is simply a , therefore the whole amount of the improved annuities is the geometrical series $a+aR+aR^2$, &c. . . aR^{t-1} . The sum of this series, by Chap. VI. Sect. 2. is $a \times \frac{R^t-1}{R-1} = a \times \frac{R^t-1}{r}$.

But, from the nature of the problem, $pR^t = a \times \frac{R^t-1}{r}$,

and hence $p = a \times \frac{R^t-1}{rR^t} = a \times 1 - \frac{1}{R^t}$.

The same conclusion results from calculating the present worth of the several annuities, considered as sums payable in reversion.

Cor. 1. Of these four p, a, R, t , any three being given, the fourth may be found, by the solution of equations; t is found easily by logarithms, R or r can be

Cor. 2. If an annuity has been unpaid for the term t , the arrear, reckoning compound interest, will be $a \times \frac{R^t-1}{r}$.

Cor. 3. The present worth of an annuity in reversion, that is to commence after a certain time (n), and then to continue t years, is found by subtracting the present worth for n years from the present worth for $n+t$ years, and then

$$p = a \times \frac{R^t-1}{rR^n} = a \times 1 - \frac{1}{R^n}$$

Also of R, t, n, a, p , any four being given, the fifth may be found.

Cor. 4. If the annuity is to continue for ever, then R^t-1 and R^t may be considered as the same; and $p = a \times \frac{R^t-1}{rR^t} = \frac{a}{r}$.

Cor. 5. A perpetuity in reversion (by Cor. 3.) since $R^t-1 = R^t$, is $p = \frac{a}{rR^n}$.

Prob. When 12 years of a lease of 21 were expired, a renewal for the same term was granted for 1000l.; 8 years are now expired, and for what sum must a corresponding renewal be made, reckoning 5 per cent. compound interest?

From the first transaction the yearly profit rent must be deduced; and from this the proper fine in the second may be computed.

In the first bargain, an annuity in reversion for 12 years, to commence 9 years hence, was sold for 1000l. the annuity will therefore be found by Cor. 3. in which all the quantities are given, but $a = p \times \frac{rR^n}{1 - \frac{1}{R^t}}$.

and by inserting numbers, viz. $p=1000, t=12, n=9, r=.05$, and $R=1.05$; and working by logarithms $a=175.029=175l. - 7d$.

Next, having found a , the second renewal is made by finding the present worth of the annuity a in reversion, to commence 13 years hence, and to last 8 years. In the canon (Cor. 3.) insert for a 175.029, and let $t=8, n=13$, and $r=.05$ as before, $p=599.93=599l. 18s. 6\frac{1}{2}d$. The fine required.

As these computations often become troublesome, and are of frequent use, all the common cases are calculated in tables, from which the value of any annuity, for any time, at any interest, may easily be found.

It is to be observed also, that the preceding rules are computed on the supposition of the annuities being paid yearly; and therefore, if they be supposed to be paid half yearly, or quarterly, the conclusions will be somewhat different, but they may easily be calculated on the preceding principles.

The calculations of life annuities, depend partly upon the principles now explained, and partly on physical principles, from the probable duration of human life, as deduced from bills of mortality.

P A R T II.

Of the General Properties and Resolution of EQUATIONS of all Orders.

C H A P. I.

Of the Origin and Composition of Equations; and of the Signs and Coefficients of their Terms.

IN order to resolve the higher orders of equations, and to investigate their general affections, it is proper first to consider their origin from the combination of inferior equations.

As it would be impossible to exhibit particular rules for the solution of every order of equations, their number being indefinite; there is a necessity of deducing rules from their general properties, which may be equally applicable to all.

In the application of algebra to certain subjects, and especially to geometry, there may be an opposition in the quantities, analogous to that of addition and subtraction, which may therefore be expressed by the signs + and -. Hence these signs may be understood by abstraction, to denote contrariety in general; and therefore, in this method of treating of equations, negative roots are admitted as well as positive. In many cases the negative will have a proper and determinate meaning; and when the equation relates to magnitude only, where contrariety cannot be supposed to exist, these roots are neglected, as in the case of quadratic equations formerly explained. There is besides this advantage in admitting negative roots, that both the properties of equations from which their resolution is obtained, and also those which are useful in the many extensive applications of algebra, become more simple and general, and are more easily deduced.

In this general method, all the terms of any equation are brought to one side, and the equation is expressed by making them equal to 0. Therefore, if a root of the equation be inserted instead of (x) the unknown quantity, the positive terms will be equal to the negative, and the whole must be equal to 0.

Def. When any equation is put into this form, the term in which (x) the unknown quantity, is of the highest power, is called the *First*; that in which the index of x is less by 1, is the *Second*, and so on, till the last into which the unknown quantity does not enter, and which is called the *Absolute Term*.

Prop. I. If any number of equations be multiplied together, an equation will be produced, of which the dimension (A) is equal to the sum of the dimensions of the equations multiplied.

If any number of simple equations be multiplied together, as $x-a=0$, $x-b=0$, $x-c=0$, &c. it is obvious, that the product will be an equation of a dimen-

sion, containing as many units as there are simple equations. In like manner, if higher equations are multiplied together, as a cubic and a quadratic, one of the fifth order is produced, and so on.

Conversely. An equation of any dimension is considered as compounded either of simple equations, or of others, such that the sum of their dimensions is equal to the dimension of the given one. By the resolution of equations these inferior equations are discovered, and by investigating the component simple equations, the roots of any higher equation are found.

Cor. 1. Any equation admits of as many solutions, or has as many roots as there are simple equations which compose it, that is, as there are units in the dimension of it.

Cor. 2. And conversely, no equation can have more roots than the units in its dimension.

Cor. 3. Imaginary or impossible roots must enter an equation by pairs; for they arise from quadratics, in which both the roots are such.

Hence also, an equation of an even dimension may have all its roots, or any even number of them impossible, but an equation of an odd dimension must at least have one possible root.

Cor. 4. The roots are either positive or negative, according as the roots of the simple equations, from which they are produced, are positive or negative.

Cor. 5. When one root of an equation is discovered, one of the simple equations is found, from which the given one is compounded. The given equation, therefore, being divided by this simple equation, will give an equation of a dimension lower by 1. Thus, any equation may be depressed as many degrees as there are roots found by any method whatever.

Prop. II. To explain the general properties of the signs and coefficients of the terms of an equation.

Let $x-a=0$, $x-b=0$, $x-c=0$, $x-d=0$, &c. be simple equations, of which the roots are any positive quantities +a, +b, +c, +d, &c. and let $x+m=0$, $x+n=0$, &c. be simple equations, of which the roots are any negative quantities -m, -n, &c. and let any number of these equations be multiplied together, as in the following table :

$$\begin{array}{l} \frac{x-a=0}{\times x-b=0} \\ \hline =x^2-ax \\ \quad -bx+ab \\ \times x-c=0 \\ \hline \end{array} \left. \vphantom{\begin{array}{l} \frac{x-a=0}{\times x-b=0} \\ \hline =x^2-ax \\ \quad -bx+ab \\ \times x-c=0 \\ \hline \end{array}} \right\} =0, \text{ a Quadratic.}$$

(A) The term *dimension*, in this treatise, is used in senses somewhat different, but so as not to create any ambiguity. In this chapter it means either the order of an equation, or the number denoting that order, which was formerly defined to be the highest exponent of the unknown quantity in any term of the equation.

Of Equations. $\left. \begin{matrix} =x^3-a \\ -b \\ -c \end{matrix} \right\} +x^2+ac \left. \begin{matrix} +ab \\ +bc \end{matrix} \right\} \times x-abc=0, \text{ a Cubic.}$
 $\times x+m=0$

$\left. \begin{matrix} =x^4-a \\ -b \\ -c \\ +m \end{matrix} \right\} \times x^3+ac \left. \begin{matrix} +ab \\ +bc \\ -am \\ -bm \\ -cm \end{matrix} \right\} \times x^2+acm \left. \begin{matrix} -abc \\ +abm \\ +bcm \end{matrix} \right\} \times x-abc m=0, \text{ a}$
 (Biquadratic,

&c.

From this table it is plain,

1. That in a complete equation the number of terms is always greater by unit than the dimension of the equation.

2. The coefficient of the first term is 1.

The coefficient of the second term is the sum of all the roots ($a, b, c, m, \&c.$) with their signs changed.

The coefficient of the third term is the sum of all the products that can be made by multiplying any two of the roots together.

The coefficient of the fourth term is the sum of all the products which can be made by multiplying together any three of the roots with their signs changed; and so of others.

The last term is the product of all the roots, with their signs changed.

3. From induction it appears, that in any equation (the terms being regularly arranged as in the preceding example) there are as many positive roots as there are changes in the signs of the terms from + to -, and from - to +; and the remaining roots are negative. The rule also may be demonstrated.

Note. The impossible roots in this rule are supposed to be either positive or negative.

In this example of a numeral equation $x^4-10x^3+35x^2-50x+24=0$, the roots are, +1, +2, +3, +4, and the preceding observations with regard to the signs and coefficients take place.

Cor. If a term of an equation is wanting, the positive and negative parts of its coefficient must then be equal. If there is no absolute term, then some of the roots must be =0, and the equation may be depressed by dividing all the terms by the lowest power of the unknown quantity in any of them. In this case also, $x=0=0, x=0=0, \&c.$ may be considered as so many of the component simple equations, by which the given equation being divided, it will be depressed so many degrees.

CHAP. II.

Of the Transformation of Equations.

THERE are certain transformations of equations necessary towards their solution; and the most useful are contained in the following propositions.

Prop. 1. The affirmative roots of an equation become negative, and the negative become affirmative, by changing the signs of the alternate terms, beginning with the second.

Thus the roots of the equation $x^4-x^3-19x^2+49x$

$-30=0$ are +1, +2, +3, -5, whereas the roots of the equation $x^4+x^3-19x^2-49x-30=0$, are -1, -2, -3, +5.

The reason of this is derived from the composition of the coefficients of these terms, which consist of combinations of odd numbers of the roots, as explained in the preceding Chapter.

Prop. 2. An equation may be transformed into another that shall have its roots greater or less than the roots of the given equation by some given difference.

Let x be the unknown quantity of the equation, and e the given difference; let $y=x \pm e$, then $x=y \mp e$; and if for x and its powers in the given equation, $y \mp e$ and its powers be inserted, a new equation will arise, in which the unknown quantity is y , and its value will be $x \pm e$; that is, its roots will differ from the roots of the given equation by e .

Let the equation proposed be $x^3-px^2+qx-r=0$, of which the roots must be diminished by e . By inserting for x and its powers $y+e$ and its powers, the equation required is,

$$\left. \begin{matrix} y^3+3ey^2+3e^2y+e^3 \\ -py^2-2pey-pe^2 \\ +qy+qe \\ -r \end{matrix} \right\} = 0.$$

Cor. 1. From this transformation, the second, or any other intermediate term, may be taken away; granting the resolution of equations.

Since the coefficients of all the terms of the transformed equation, except the first, involve the powers of e and known quantities only, by putting the coefficient of any term equal to 0, and resolving that equation, a value of e may be determined; which being substituted, will make that term to vanish.

Thus, in this example, to take away the second term, let its coefficient, $3e-p=0$, and $e=\frac{1}{3}p$, which being substituted for e , the new equation will want the second term. And universally, the coefficient of the first term of a cubic equation being 1, and x being the unknown quantity, the second term may be taken away by supposing $x=y \mp \frac{1}{3}p, \pm \frac{1}{3}p$ being the coefficient of that term.

Cor. 2. The second term may be taken away by the solution of a simple equation, the third by the solution of a quadratic, and so on.

Cor. 3. If the second term of a quadratic equation be taken away, it will become a pure equation, and thus a solution of quadratics will be obtained, which coincides with the solution already given in Part I.

Cor. 4. The last term of the transformed equation is the same with the given equation, only having e in place of x .

Prop. 3. In like manner may an equation be transformed into another, of which the roots shall be equal to the roots of the given equation, multiplied or divided by a given quantity.

Let x be the unknown letter in the given equation, and y that of the equation wanted; also let e be the given quantity.

To multiply the roots let $xe=y$, and $x=\frac{y}{e}$.

To divide the roots let $\frac{x}{e}=y$, and $x=ye$.

Then

Of Equations.

Of Equations.

Then substitute for x and its powers, $\frac{y}{e}$ or ye and its powers, and the new equation of which y is the unknown quantity will have the property required.

Cor. 1. By this proposition an equation, in which the coefficient of the first term is any known quantity, as a , may be transformed into another, in which the coefficient of the first term shall be unit. Thus, let the equation be $ax^3 - px^2 + qx - r = 0$. Suppose $y = ax$, or $x = \frac{y}{a}$, and for x and its powers insert $\frac{y}{a}$ and its powers, and the equation becomes $\frac{y^3}{a^3} - \frac{py^2}{a^2} + \frac{qy}{a} - r = 0$, or $y^3 - py^2 + qay - a^2r = 0$. Also, let the equation be $5x^3 - 6x^2 + 7x - 30 = 0$; and if $x = \frac{y}{5}$, then $y^3 - 6y^2 + 35y - 750 = 0$.

Cor. 2. If the two transformations in Prop. 2. and 3. be both required, they may be performed either separately or together.

Thus, if it is required to transform the equation $ax^3 - px^2 + qx - r = 0$ into one which shall want the second term, and in which the coefficient of the first term shall be 1; let $x = \frac{y}{a}$, and then $y^3 - py^2 + qay - a^2r = 0$ as before; then let $y = z + \frac{1}{3}p$, and the new equation, of which z is the unknown quantity, will want the second term, and the coefficient of z^3 , the highest term is 1. Or, if $x = \frac{z + \frac{1}{3}p}{a}$, the same equation as the last found will arise from one operation.

Ex. Let the equation be $5x^3 - 6x^2 + 7x - 30 = 0$. If $x = \frac{y}{5}$, then $y^3 - 6y^2 + 35y - 750 = 0$. And if $y = z + 2$, $z^3 + 23z - 696 = 0$. Also, at once, let $x = \frac{z + 2}{5}$, and the equation properly reduced, by bringing all the terms to a common denominator, and then casting it off, will be $z^3 + 23z - 696 = 0$, as before.

Cor. 3. If there are fractions in an equation, they may be taken away, by multiplying the equation by the denominators, and by this proposition the equation may then be transformed into another, without fractions, in which the coefficient of the first term is 1. In like manner may a surd coefficient be taken away in certain cases.

Cor. 4. Hence also, if the coefficient of the second term of a cubic equation is not divisible by 3, the fractions thence arising in the transformed equation, wanting the second term, may be taken away by the preceding corollary. But the second term also may be taken away, so that there shall be no such fractions in the transformed equation, by supposing $x = \frac{z + p}{3}$, $\pm p$ being the coefficient of the second term of the given equation. And if the equation $ax^3 - px^2 + qx - r = 0$ be given, in which p is not divisible by 3, by supposing $x = \frac{z + p}{3}$, the transformed equation reduced is $z^3 - 3p^2 + 9aq \cdot xz - 2p^3 + 9apq - 27a^2r = 0$; wanting the second term, having 1 for the coefficient of the first

term, and the coefficients of the other terms being all integers, the coefficients of the given equation being also supposed integers.

General Corollary to Prop. 1. 2. 3.

If the roots of any of these transformed equations be found by any method, the roots of the original equation, from which they were derived, will easily be found from the simple equations expressing their relation. Thus, if 8 is found to be a root of the transformed equation $z^3 + 23z - 696 = 0$ (Cor. 2. prop. 3.) Since $x = \frac{z + 2}{5}$, the corresponding root of the given equation $5x^3 - 6x^2 + 7x - 30 = 0$ must be $\frac{8 + 2}{5} = 2$. It is to be observed also, that the reasoning in Prop. 2. and 3. and the corollaries, may be extended to any order of equations, though in them it is applied chiefly to cubics.

CHAP. III.

Of the Resolution of Equations.

From the preceding principles and operations, rules may be derived for resolving equations of all orders.

I. CARDAN'S Rule for Cubic Equations.

The second term of a cubic equation being taken away, and the coefficient of the first term being made 1, (by Cor. 1. Prop. 2. and Cor. 1. Prop. 3. Chap. II.) it may be generally represented by $x^3 + 3qx + 2r = 0$; the sign + in all terms denoting the addition of them, with their proper signs. Let $x = m + n$, and also $mn = -q$; by the substitution of these values, an equation of the 6th order, but of the quadratic form, is deduced, which gives the values of m and n ; and hence,

$$(m + n) = x = \sqrt[3]{-r + \sqrt{r^2 + q^3}} + \sqrt[3]{-r - \sqrt{r^2 + q^3}};$$

$$\text{or } x = \sqrt[3]{-r + \sqrt{r^2 + q^3}} - \sqrt[3]{-r + \sqrt{r^2 + q^3}}.$$

Cor. 1. In the given equation, if $3q$ is negative, and if r^2 is less than q^3 , this expression of the root involves impossible roots; while, at the same time, all the roots of that equation are possible. The reason is, that in this method of solution it is necessary to suppose that x the root may be divided into two parts, of which the product is q . But it is easy to show, that in this, which is called the *irreducible case*, it cannot be done.

For example, the equation (Ex. 3. Sect. 3. of this Chapter), $x^3 - 156x + 560 = 0$, belongs to the irreducible case, and the three roots are +4, +10, -14; and it is plain that none of these roots can be divided into two parts (m and n), of which the product can be equal to $(-q) = \frac{156}{3} = 52$; for the greatest product from the division of the greatest root -14, is $-7 \times -7 = 49$ less than 52.

If the cube root of the compound surd can be extracted, the impossible parts balance each other, and the true root is obtained.

The geometrical problem of the trisection of an arch.

Of Equations.

arch is resolved algebraically, by a cubic equation of this form; and hence the foundation of the rule for resolving an equation belonging to this case, by a table of fines.

Cor. 2. Biquadratic equations may be reduced to cubics, and may therefore be resolved by this rule.

Some other classes of equations, too, may be resolved by particular rules; but these, and every other order of equations, are commonly resolved by the general rules, which may be equally applied to all.

II. Solution of Equations, whose Roots are commensurate.

Rule 1. All the terms of the equation being brought to one side, find all the divisors of the absolute term, and substitute them successively in the equation for the unknown quantity. That divisor which, substituted in this manner, gives the result = 0, shall be a root of the equation.

$$\text{Ex. 1. } \left. \begin{array}{l} x^3 - 3ax^2 + 2a^2x - 2a^2b \\ -bx^2 + 3abx \end{array} \right\} = 0.$$

The simple literal divisors of $-2a^2b$ are $a, b, 2a, 2b$, any of which may be inserted for x . Supposing $x = +a$, the equation becomes

$$\left. \begin{array}{l} a^3 - 3a^3 + 2a^3 - 2a^2b \\ -ba^2 + 3a^2b \end{array} \right\} \text{ which is obviously } = 0.$$

$$\text{Ex. 2. } x^3 - 2x^2 - 33x + 90 = 0.$$

The divisors of 90 are 1, 2, 3, 5, 6, 9, 10, 15, 18, 30, 45, 90.

The first of these divisors, which being inserted for x , will make the result = 0, is +3; +5 is another; and it is plain the last root must be negative, and it is -6.

When 3 is discovered to be a root, the given equation may be divided by $x - 3 = 0$, and the result will be a quadratic, which being resolved will give the other two roots, +5 and -6.

The reason of the rule appears from the property of the absolute term formerly defined, viz. that it is the product of all the roots.

To avoid the inconvenience of trying many divisors, this method is shortened by the following

Rule 2. Substitute in place of the unknown quantity successively three or more terms of the progression, 1, 0, -1, &c. and find all the divisors of the sums that result; then take out all the arithmetical progressions that can be found among these divisors whose common difference is 1, and the values of x will be among those terms of the progressions which are the divisors of the result arising from the substitution of $x = 0$. When the series increases, the roots will be positive; and when it decreases, the roots will be negative.

Examp. Let it be required to find a root of the equation $x^3 - x^2 - 10x + 6 = 0$.

The operation is thus:

Supposit.	Result.	Divisors.	Ar. pro.
$x = 1$	-	-	-
$x = 0$	$x^3 - x^2 - 10x + 6 =$	$\left\{ \begin{array}{l} -4 \\ +6 \\ +14 \end{array} \right.$	$\left\{ \begin{array}{l} 1, 2, 4, \\ 1, 2, 3, 6, \\ 1, 2, 7, 14, \end{array} \right.$
$x = -1$	-	-	-

In this example there is only one progression, 4, 3, 2; and therefore 3 is a root, and it is -3, since the series decreases.

It is evident from the rules for transforming equations (Chap. II.), that by inserting for x , +1 (= +e) the result is the absolute term of an equation of which the roots are less than the roots of the given equation by 1 (=e). Cor. 4. Prop. 2. When $x = 0$ the result is the absolute term of the given equation. When for x is inserted -1 (= -e) the result is the absolute term of an equation whose roots exceed the roots of the given equation by 1 (=e). Hence, if the terms of the series 1, 0, -1, -2, &c. be inserted successively for x , the results will be the absolute terms of so many equations, of which the roots form an increasing arithmetical series with the difference 1. But as the commensurate roots of these equations must be among the divisors of their absolute terms, hence they must be among the arithmetical progressions found by this rule. The roots of the given equation therefore are to be sought for among the terms of these progressions which are divisors of the result, upon the supposition of $x = 0$, because that result is its absolute term.

It is plain that the progressions must always be increasing, only it is to be observed, that a decreasing series with the sign + becomes increasing with the sign -. Thus, in the preceding example, -4, -3,

Nº 11.

-2, is an increasing series, of which -3 is to be tried, and it succeeds.

If, from the substitution of three terms of the progression, 1, 0, -1, &c. there arise a number of arithmetical series, by substituting more terms of that progression, some of the series will break off, and, of course, fewer trials will be necessary.

III. Examples of Questions producing the higher Equations.

Examp. 1. It is required to divide 16l. between two persons, so that the cube of the one's share may exceed the cube of the other's by 386.

Let the greater share be x pounds,
And the less will be $16 - x$;

$$\text{By the question, } x^3 - 16 - x^3 = 386$$

$$\text{And by Inv. } 2x^3 - 48x^2 + 768x - 4096 = 386$$

$$\text{Transp. and divide } x^3 - 24x^2 + 384x - 2241 = 0.$$

Suppos.	Results.	Divisors.
If $x = 1$;	- 1880	- 1, 2, 4, 5, 8, 10, 20,
$x = 0$;	- 2241	- 1, 3, 9, 27, 83.
$x = -1$;	- 2650	- 1, 2, 5, 10, 25, 53.

Where 8, 9, 10, differ by 1; therefore +9 is to be tried; and being inserted for x , the equation is = 0. The two shares then are 9 and 7 which succeed.

Since

Of Equations.

Of Equations.

Since $x=9$; $x-9=0$, is one of the simple equations from which this cubic is produced, therefore $\frac{x^3-24x^2+384x-2241}{x-9} = x^2-15x+249=0$. And the two roots of this quadratic are impossible.

Examp. 2. What two numbers are those whose product multiplied by the greater will produce 405, and their difference multiplied by the less 20?

Let the greater number be x , and the less y .

Then by quest. $\begin{cases} (xy \times x) = 405 \\ (x-y) \times y = 20 \end{cases}$

Therefore $x = \frac{y^2+20}{y}$

And $x^2 = \frac{y^4+40y^2+400}{y^2}$

Also $x^2 = \frac{405}{y}$

Therefore $\frac{y^4+40y^2+400}{y^2} = \frac{405}{y}$

Mult. and transp. $y^4+40y^2-405y+400=0$.

This biquadratic, resolved by divisors, gives $y=5$:

and therefore $x=9$. Also $\frac{y^4+40y^2-405y+400}{y-5} = y^3+5y^2+65y-80=0$.

This cubic equation has one positive incommensurate root, viz. 1.114, &c. which may be found by the rule in the next section, and two impossible. The incommensurate root $y=1.114$, &c. gives $x=19.067$, &c. and these two answer the conditions very nearly.

Examp. 3. The sum of the squares of two numbers 208, and the sum of their cubes 2240 being given, to find them.

Let the greater be $x+y$, and the less $x-y$.

Then $(x+y)^2+(x-y)^2=2x^2+2y^2=208$

Hence $y^2=104-x^2$

Also $(x+y)^3+(x-y)^3=2x^3+6xy^2=2240$

Substitute for y^2 its value and $2x^3+624x-6x^3=2240$.

This reduced gives $x^3-156x+560=0$.

The roots of this equation are +10, +4, -14. If $x=10$, then $y=2$; and the numbers sought are 12 and 8, which give the only just solution. If $x=4$, then $y^2=88$ and $y=\sqrt{88}$. The numbers sought are therefore $4+\sqrt{88}$ and $4-\sqrt{88}$. The last is negative, but they answer the conditions. Lastly, if $x=-14$, then $y^2=-92$, hence $y=\sqrt{-92}$, is impossible; but still the two numbers $-14+\sqrt{-92}$, $-14-\sqrt{-92}$, being inserted, would answer the conditions. But it has been frequently observed, that such solutions are both useless and without meaning.

IV. Solution of Equations by Approximation.

By the former rules, the roots of equations, when they are commensurate, may be obtained. These, however, more rarely occur; and when they are incommensurate, we can find only an approximate value of them, but to any degree of exactness required. There are various rules for this purpose; one of the most simple is that of Sir Isaac Newton, which shall be now explained.

VOL. I. Part II.

Lemma. If any two numbers, being inserted for the unknown quantity (x) in any equation, give results with opposite signs, an odd number of roots must be between these numbers.

This appears from the property of the absolute term, and from this obvious maxim, that if a number of quantities be multiplied together, and if the signs of an odd number of them be changed, the sign of the product is changed. For, when a positive quantity is inserted for x , the result is the absolute term of an equation whose roots are less than the roots of the given equation by that quantity (Prop. 2. Cor. 3. Chap. II.) If the result has the same sign as the given absolute term, then from the property of the absolute term (Prop. 2. Chap. I.) either none or an even number only of the positive roots, have had their signs changed by the transformation; but if the result has an opposite sign to that of the given absolute term, the signs of an odd number of the positive roots must have been changed. In the first case, then, the quantity substituted must have been either greater than each of an even number of the positive roots of the given equation, or less than any of them; in the second case, it must have been greater than each of an odd number of the positive roots. An odd number of the positive roots, therefore, must lie between them when they give results with opposite signs. The same observation is to be extended to the substitution of negative quantities and the negative roots.

From this lemma, by means of trials, it will not be difficult to find the nearest integer to a root of a given numeral equation. This is the first step towards the approximation; and both the manner of continuing it, and the reason of the operation, will be evident from the following example.

Let the equation be $x^3-2x-5=0$.

1. Find the nearest integer to the root. In this case a root is between 2 and 3; for these numbers being inserted for x , the one gives a positive, and the other a negative, result. Either the number above the root, or that below it, may be assumed as the first value; only it will be more convenient to take that which appears to be nearest to the root, as will be manifest from the nature of the operation.

2. Suppose $x=2+f$, and substitute this value of x in the equation.

$$\begin{array}{r} x^3 = 8 + 12f + 6ff + f^3 \\ -2x = -4 - 2f \\ -5 = -5 \\ \hline x^3 - 2x - 5 = -1 + 10f + 6f^2 + f^3 = 0. \end{array}$$

As f is less than unit, its powers f^2 and f^3 may be neglected in this first approximation, and $10f=1$, or $f=0.1$ nearly, therefore $x=2.1$ nearly.

3. As $f=0.1$ nearly, let $f=.1+g$, and insert this value of f in the preceding equation.

$$\begin{array}{r} f^3 = 0.001 + 0.03g + 0.3g^2 + g^3 \\ 6f^2 = 0.06 + 1.2g + 6.g^2 \\ 10f = 1 + 10g \\ -1 = -1 \\ \hline f^3 + 6f^2 + 10f - 1 = 0.061 + 11.23g + 6.3g^2 + g^3 = 0 \\ \text{and neglecting } g^2 \text{ and } g^3 \text{ as very small } 0.61 + 11.23g \\ \hline 31 = 0, \end{array}$$

Application to Geometry. $=0$, or $g = \frac{-0.061}{11.23} = -.0054$, hence $f = 0.1 + g = .0946$ nearly, and $x = 2.0946$ nearly.

4. This operation may be continued to any length, as by supposing $g = -.0054 + b$, and so on, and the value of $x = 2.09455147$ nearly.

By the first operation a nearer value of x may be found thus; since $f = .1$ nearly and $-1 + 10f + 6f^2 + f^3 = 0$, $f = \frac{1}{10 + 6f + f^2}$, that is, $f = \frac{1}{10 + .6 + .01} = .094$ true to the last figure, and $x = 2.094$.

In the same manner may the root of a pure equation be found, and this gives an easy method of approximating to the roots of numbers which are not perfect powers.

This rule is applicable to numeral equations of every order; and, by assuming a general equation, general rules may be deduced for approximating to the roots of any proposed equation. By a similar method we may approximate to the roots of literal equations, which will be expressed by infinite series.

P A R T III.

Of the Application of ALGEBRA to GEOMETRY.

C H A P. I.

General Principles.

GEOMETRY treats both of the magnitude and position of extension, and their connections.

Algebra treats only of magnitude; therefore, of the relations which subsist in geometrical figures, those of magnitude only can be immediately expressed by algebra.

The opposite position of straight lines may indeed be expressed simply by the signs + and -. But, in order to express the various other positions of geometrical figures by algebra from the principles of geometry, some relations of magnitude must be found, which depend upon these positions, and which can be exhibited by equations: And, conversely, by the same principles may the positions of figures be inferred from the equations denoting such relations of their parts.

Though this application of algebra appears to be indirect, yet such is the simplicity of the operations, and the general nature of its theorems, that investigations, especially in the higher parts of geometry, are generally easier and more expeditious by the algebraical method, though less elegant than by what is purely geometrical. The connections also, and analogies of the two sciences established by this application, have given rise to many curious speculations.

Geometry has been rendered far more extensive and useful, and algebra itself has received considerable improvements.

I. Of the Algebraical Expression of Geometrical Magnitudes.

A line, whether known or unknown, is represented by a single letter: a rectangle is properly expressed by the product of the two letters representing its sides: and a rectangular parallelepiped by the product of three letters; two of which represent the sides of any of its rectangular bases, and the third the altitude.

These are the most simple expressions of geometrical magnitudes; and any other which has a known proportion to these, may in like manner be expressed algebraically. Conversely, the geometrical magnitudes, represented by such algebraical quantities, may be found, only the algebraical dimensions above the third, not having any corresponding geometrical dimensions, must be expressed by proportionals (A).

The opposite position of straight lines, it has been remarked, may be expressed by the signs + and -.

Thus, let a point A be given in the line

AP, any segment AP taken to the right hand being considered as positive, a segment Ap to the left is properly

(A) All algebraical dimensions above the third must be expressed by inferior geometrical dimensions; and though any algebraical quantities of two or three dimensions may be immediately expressed by surfaces and solids respectively, yet it is generally necessary to express them, and all superior dimensions, by lines.

If, in any geometrical investigation by algebra, each line is expressed by a single letter, and each surface or solid by an algebraical quantity of two or three dimensions respectively, then whatever legitimate operations are performed with regard to them, the terms in any equation derived will, when properly reduced, be all of the same dimension; and any such equation may be easily expressed geometrically by means of proportionals, as in the following example.

Thus, if the algebraical equation $a^4 + b^4 = c^4 - d^4$, is to be expressed geometrically, a, b, c , and d , being supposed to represent straight lines; let $a : b :: e : f : g$, in continued proportion, then $a^4 : b^4 :: a : g$ and $a^4 : a^4 + b^4 :: a : a + g$; then let $a : c :: h : k : l$, and $a^4 : c^4 :: a : l$; also, let $c : d :: m : n : p$, and $c^4 : d^4 :: c : p$, or $c^4 : c^4 - d^4 :: c : c - p$. By combining the two former proportions (Chap. II. Part I.), $c^4 : a^4 + b^4 :: l : a + g$, and combining the latter with this last found, $c^4 - d^4 : a^4 + b^4 :: c - p : l$; therefore $c - p \times l = c \times a + g$, and $c : c - p :: l : a + g$.

Application to Geometry. perly represented by a negative quantity. If a and b represent two lines; and if, upon the line AB from the point A , AP be taken towards the right equal to a , it may be expressed by $+a$; then PM taken to the left and equal to b , will be properly represented by $-b$, for AM is equal to $a-b$. If $a=b$, then M will fall upon A , and $a-b=0$. By the same notation, if b is greater than a , M will fall to the left of A ; and in this case, if $2a=b$, and if Pp be taken equal to b , then $(a-b)=-a$ will represent Ap , which is equal to a , and situated to the left of A . This use of the signs, however, in particular cases, may be precluded, or in some measure restrained.

The positions of geometrical figures are so various, that it is impossible to give general rules for the algebraical expression of them. The following are a few examples.

An angle is expressed by the ratio of its sine to the radius; a right angle in a triangle, by putting the squares of the two sides equal to the square of the hypotenuse; the position of points is ascertained by the perpendiculars from them on lines given in position; the position of lines by the angles which they make with given lines, or by the perpendiculars on them from given points; the similarity of triangles by the proportionality of their sides which gives an equation, &c.

These and other geometrical principles must be employed both in the demonstration of theorems and in the solution of problems. The geometrical proposition must first be expressed in the algebraical manner, and the result after the operation must be expressed geometrically.

II. The Demonstration of Theorems.

All propositions in which the proportions of magnitudes only are employed, also all propositions expressing the relations of the segments of a straight line, of their squares, rectangles, cubes, and parallelepipeds, are demonstrated algebraically with great ease. Such demonstrations, indeed, may in general be considered as an abridged notation of what are purely geometrical.

This is particularly the case in those propositions which may be geometrically deduced without any construction of the squares, rectangles, &c. to which they refer. From the first proposition of the second book of Euclid, the nine following may be easily derived in this manner, and they may be considered as proper examples of this most obvious application of algebra to geometry.

If certain positions are either supposed or to be inferred in a theorem, we must find, according to the preceding observations, the connection between these positions and such relations of magnitude as can be expressed and reasoned upon by algebra. The algebrai-

cal demonstrations of the 12th and 13th propositions of the 2d book of Euclid, require only the 47th of the I. El. (The 35th and 36th of the 3d book require only the 3. III. El. and 47. I. El.)

From a few simple geometrical principles alone, a number of conclusions, with regard to figures, may be deduced by algebra; and to this in a great measure is owing the extensive use of this science in geometry. If other more remote geometrical principles are occasionally introduced, the algebraical calculations may be much abridged. The same is to be observed in the solution of problems; but such in general are less obvious, and more properly belong to the strict geometrical method.

III. Of the Solution of Problems.

Upon the same principles are geometrical problems to be resolved. The problem is supposed to be constructed, and proper algebraical notations of the known and unknown magnitudes are to be sought for, by means of which their connections may be expressed by equations. It may first be remarked, as was done in the case of theorems, that in those problems which relate to the divisions of a line and the proportions of its parts, the expression of the quantities, and the stating their relations by equations, are so easy as not to require any particular directions. But when various positions of geometrical figures and their properties are introduced, the solution requires more attention and skill. No general rules can be given on this subject, but the following observations may be of use.

1. The construction of the problem being supposed, it is often farther necessary to produce some of the lines till they meet; to draw new lines joining remarkable points; to draw lines from such points perpendicular or parallel to other lines, and such other operations as seem conducive to the finding of equations; and for this purpose, those especially are to be employed which divide the scheme into triangles that are given, right angled or similar.

2. It is often convenient to denote by letters, not the quantities particularly sought, but some others from which they can easily be deduced. The same may be observed of given quantities.

3. The proper notation being made, the necessary equations are to be derived by the use of the most simple geometrical principles; such as the addition and subtraction of lines or of squares, the proportionality of lines, particularly of the sides of similar triangles, &c.

4. There must be as many independent equations as there are unknown quantities assumed in the investigation, and from these a final equation may be inferred by the rules of Part I.

If the final equation from the problem be resolved, the roots may often be exhibited geometrically; but the geometrical construction of problems may be ef-

3 I 2

fected

If any known line is assumed as 1 , as its powers do not appear, the terms of an equation, including any of them, may be of very different dimensions; and before it can be properly expressed by geometrical magnitudes, the deficient dimensions must be supplied by powers of the 1 . When an equation has been derived from geometrical relations, the line denoting 1 is known; and when an assumed equation is to be expressed by the relations of geometrical magnitudes, the 1 is to be assumed.

In this manner may any single power be expressed by a line. If it is x^5 , then to 1 , x find four quantities in continued proportion; so that $1 : x : m : n : p : q$, then $1 : q :: 1^5 : x^5$, or $q = x^5$; and so of others.

Application to Geometry.

feared also without resolving the equation, and even without deducing a final equation, by the methods afterwards to be explained.

If the final equation is simple or quadratic, the roots being obtained by the common rules, may be geometrically exhibited by the finding of proportionals, and the addition or subtraction of squares.

By inserting numbers for the known quantities, a numeral expression of the quantities sought will be obtained by resolving the equation. But in order to determine some particulars of the problem besides finding the unknown quantities of the equation, it may be farther necessary to make a simple construction; or, if it is required that every thing be expressed in numbers, to substitute a new calculation in place of that construction.

PROP. I. To divide a given straight line AB into two parts, so that the rectangle contained by the whole line and one of the parts may be equal to the square of the other part.

This is prop. 11th II. B. of Eucl.

Let C be the point of division, and let $AB = a$, $AC = x$, and then $CB = a - x$. From the problem $a^2 - ax = x^2$; and this equation being resolved (Chap. V. P. II.) gives $x = \frac{a \pm \sqrt{a^2 + a^2}}{2}$.

The quantity $\sqrt{a^2 + \frac{a^2}{4}}$, is the hypotenuse of a right-angled triangle, of which the two sides are a and $\frac{a}{2}$, and is therefore easily found; $\frac{a}{2}$ being taken from this line, gives $x = AC$, which is the proper solution. But if a line AC be taken on the opposite side of A, and equal to the above-mentioned hypotenuse, together with $\frac{a}{2}$, it will represent the negative root—

$\frac{a}{2}$, and will give another solution; for in this case also $AB \times BC = AC^2$. But c is without the line AB; and therefore, if it is not considered as making a division of AB, this negative root is rejected.

This solution coincides with what is given by Euclid. For $\sqrt{a^2 + \frac{a^2}{4}}$ is equal (see the fig. of Prop. 11th

II. B. Eucl. Simson's edit.) to EB or EF, and therefore $x = \sqrt{a^2 + \frac{a^2}{4}} - \frac{a}{2} = EF - EA = AF = AH$; and

the point H corresponds to C in the preceding figure.

Besides, if on $(EF + EA =) CF$ (instead of $EF - EA = FA$) a square be described on the opposite side of CF from AG, BA produced will meet a side of it in a point; which if it be called K, will give $KB \times BA = KA^2$. K corresponds to c , and this solution will correspond with the algebraical solution by means of the negative root.

If CB had been called x , and $AC = a - x$, the equation would be $ax = a^2 - 2ax + x^2$, which gives $x = \frac{3a \pm \sqrt{5a^2}}{2}$, in which both roots are positive, and the

solutions derived from them coincide with the preceding. If the solution be confined to a point within the line, then one of these positive roots must be rejected, for one of the roots of the compound square

from which it is derived, $x = \frac{3a}{2}$, a negative quantity, which in this strict hypothesis is not admitted. In such a problem, however, both constructions are generally received, and considered even as necessary to a complete solution of it.

If a solution in numbers be required, let $AB = 10$, then $x = \frac{10 \pm \sqrt{125}}{2} - 5$. It is plain, whatever be the value of AB, the roots of this equation are incommensurate, though they may be found, by approximation, to any degree of exactness required. In this case, $x = \pm 11.1803 - 5$, nearly; that is $AC = 6.1803$, nearly; and $Ac = 16.1803$, nearly.

PROP. II. In a given Triangle ABC to inscribe a Square.

Suppose it to be done, and let it be EFGH. From A let AD be perpendicular on the base BC, meeting EF in K.

Let $BC = a$, and $AD = p$, both of which are given because the triangle is given. Let AK be assumed as the unknown quantity, because from it the square can easily be constructed; and let it be called x . Then $(KD = EG =) EF = p - x$.

On account of the parallels EF, BC, $AD : BC :: AK : EF$; that is, $p : a :: x : p - x$, and $p^2 - px = ax$, which equation being resolved, gives $x = \frac{p^2}{p + a}$.

Therefore x or AK is a third proportional to $p + a$ and p , and may be found by 11. VI. El. The point K being found, the construction of the square is sufficiently obvious.

PROP. III. In the right-angled Triangle ABC, the Base BC, and the Sum of the Perpendicular and Sides $BA + AC + AD$ being given, to find the Triangle.

Such parts of this triangle are to be found as are necessary for describing it: The perpendicular AD will be sufficient for this purpose; and let it be called x : Let $AB + AC + AD = a$, $BC = b$; therefore $BA + AC = a - x$.

Let

Application to Geometry.

Let $BA - AC$ be denoted by y , then $BA = \frac{a+y-x}{2}$,

and $AC = \frac{a-x-y}{2}$. But [47. I. El.] $BC^2 = BA^2$

+ AC^2 , which being expressed algebraically, becomes

$$b^2 = \left(\frac{a+y-x}{2}\right)^2 + \left(\frac{a-x-y}{2}\right)^2 = \frac{a^2 - 2ax + x^2 + y^2}{2}$$

Like-

wife, from a known property of right-angled triangles,

$$BC \times AD = BA \times AC; \text{ that is, } bx = \left(\frac{a+y-x}{2}\right) \times \left(\frac{a-x-y}{2}\right)$$

This last equation

being multiplied by 2, and added to the former, gives

$$b^2 + 2bx = a^2 - 2ax + x^2, \text{ which being resolved according to the rules of Part I. Chap. V. gives } x = a + b - \sqrt{2ab + 2b^2}$$

To construct this: $a + b$ is the sum of the perimeter

and perpendicular, and is given; $\sqrt{2ab + 2b^2} =$

$\sqrt{a + b} \times 2b$ is a mean proportional between $a + b$ and

$2b$, and may be found; therefore, from the sum of the

perimeter and perpendicular subtract the mean proportional between the said sum and double the base, and the remainder will be the perpendicular required.

From the base and perpendicular the right-angled triangle is easily constructed.

In numbers, let $BA + AC + AD = 18.8 = a$; $BC = 10 = b$; then $AD = a + b - \sqrt{2ab + 2b^2} = 28.8 - \sqrt{576} = 4.8 = x$, and $BA + AC = 14$. By either of the first equations $y^2 = 2b^2 + 2ax - a^2 - x^2 = 4$ and $y = BA - AC = 2$; therefore $BA = 8$, and $AC = 6$.

The geometrical expression of the roots of final equations arising from problems may be found without resolving them by the interfection of geometrical lines.

Thus, the roots of a quadratic are found by the interfections of the circle and straight line, those of a cubic and biquadratic, by the interfections of two conic sections, &c.

The solution of problems may be effected also by the interfections of the *loci* of two intermediate equations without deducing a final equation. But these two last methods can only be understood by the doctrine of the *loci* of equations.

CHAPTER II.

Of the Definition of Lines by Equations.

LINES which can be mathematically treated of must be produced according to a uniform rule, which determines the position of every point of them.

This rule constitutes the *definition* of any line from which all its other properties are to be derived.

A straight line has been considered as so simple as to be incapable of definition. The curve lines here treated of are supposed to be in a plane; and are defined either from the section of a solid by a plane, or more universally by some continued motion in a plane,

according to particular rules. Any of the properties which are shown to belong peculiarly to such a line, may be assumed also as the definition of it, from which all the others, and even what upon other occasions may have been considered as the primary definition, may be demonstrated. Hence lines may be defined in various methods, of which the most convenient is to be determined by the purpose in view. The simplicity of a definition, and the ease with which the other properties can be derived from it, generally give a preference.

Application to Geometry.

Definitions. 1. When curve lines are defined by equations, they are supposed to be produced by the extremity of one straight line, as PM moving in a given angle along another straight line AB given in position, which is called the base.

2. The straight line PM moving along the other, is called an *Ordinate*, and is usually denoted by y .

3. The segment of the base AP between a given point in it A , and an ordinate PM , is called an *Absciss* with respect to that ordinate, and is denoted by x . The ordinate and absciss together are called *Co-ordinates*.

4. If the relation of the variable absciss and ordinate AP and PM , be expressed by an equation, which besides x and y contains only known quantities, the curve MO described by the extremity of the ordinate, moving along the base, is called the *Locus* of that equation.

5. If the equation is finite, the curve is called *Algebraical* (A). It is this class only which is here considered.

6. The *dimensions* of such equations are estimated from the highest sum of the exponents of x and y in any term.—According to this definition, the terms x^4 , x^3y , x^2y^2 , xy^3 , y^4 are all of the same dimension.

7. Curve lines are divided into *orders* from the dimensions of their equations, when freed from fractions and surds.

In these general definitions, the straight line is supposed to be comprehended, as it is the locus of simple equations. The loci of quadratic equations are shown to

to.

(A) The terms *Geometrical* and *Algebraical*, as applied to curve lines, are used in different senses, by different writers; there are several other classes of curves besides what is here called algebraical, which can be treated of mathematically, and even by means of algebra. See Scholium at the end.

Application to Geometry.

to be the conic sections, which are hence called lines of the second order, &c.

It is sufficiently plain from the nature of an equation, containing two variable quantities, that it must determine the position of every point of the curve, defined by it in the manner now described: for if any particular known value of one of the variable quantities as x be assumed, the equation will then have one unknown quantity only, and being resolved, will give a precise number of corresponding values of y , which determine so many points of the curve.

As every point of the locus of an equation has the same general property, it must be one curve only, and from this equation all its properties may be derived. It is plain also, that any curve line defined from the motion of a point, according to a fixed rule, must either return into itself, or be extended *ad infinitum* with a continued curvature.

The equation, however, is supposed to be irreducible; because, if it is not, the locus will be a combination of inferior lines: but this combination will possess the general properties of the lines of the order of the given equation.

It is to be observed all along, that the positive values of the ordinate, as PM, being taken upwards, the negative Pm will be placed downwards, on the opposite side of the base: and if positive values of the absciss, as AP, be assumed to the right from its beginning, the negative values, AP will be upon the left, and from these the points of the curve M, m , on that side are to be determined.

In the general definition of curves it is usual to suppose the co-ordinates to be at right angles. If the locus of any equation be described, and if the absciss be assumed on another base, and the ordinate be placed at a different angle, the new equation expressing their relation, though of a different form, will be of the same order as the original equation; and likewise will have, in common with it, those properties which distinguish the equations of that particular curve.

This method of defining curves by equations may not be the fittest for a full investigation of the properties of a particular curve; but as their number is without limit, such a minute inquiry concerning all, would be not only useless, but impossible. It has this great advantage, however, that many of the general affections of all curves, and of the distinct orders, and also some of the most useful properties of particular curves, may be easily derived from it.

I. *The Determination of the Figure of a Curve from its Equation.*

The general figure of the curve may be found by substituting successively particular values of x the absciss, and finding by the resolution of these equations the corresponding values of y the ordinate, and of consequence so many points of the curve. If numeral values be substituted for x , and also certain numbers for the known letters, the resolution of the equation gives numeral expressions of the ordinates; and from these, by means of scales, a mechanical description of the curve will be obtained, which may often be useful, both in pointing out the general disposition of the figure, and also in the practical applications of geometry.

Application to Geometry.

Some more general suppositions may be of use in determining the figure; but these can be suggested only from the particular form of the equation in view. By supposing x to have certain relations to the known quantities, the values of y may become more simple, and the equation may be reduced to such a form as to show the direction of the curve, and some of its obvious properties.

The following general observations may also be laid down:

1. If in any case a value of y vanishes, then the curve meets the base in a point determined by the corresponding value of x . Hence by putting $y=0$, the roots of the equation, which in that situation are values of x , will give the distances on the base from the point assumed as the beginning of x , at which the curve meets it.

2. If at a particular value of x , y becomes infinite, the curve has an infinite arc, and the ordinate at that point becomes an asymptote.

3. If when x becomes infinitely great, y vanishes, the base becomes an asymptote.

4. If any value of y becomes impossible, then so many intersections of the ordinate and curve vanish. If at any value of x all the values of y become impossible, the ordinate does not there meet the curve.

5. If two values of y become equal and have the same sign, the ordinate in that situation either touches the curve, or passes through an intersection of two of its branches, which is called a *punctum duplex*, or through an oval become infinitely little, called a *punctum conjugatum*.

In like manner is a *punctum triplex*, &c. to be determined.

The following example will illustrate this doctrine:

Let the equation be $ay^2 - xy^2 = x^3 + bx^2$:

$$\text{Therefore, } y^2 = \frac{x^3 + bx^2}{a - x} \text{ and } y = \pm \sqrt{\frac{x^3 + bx^2}{a - x}}$$

$$= \pm \sqrt{\frac{x+b}{a-x}} \times x.$$

Let AB be assumed as a base on which the abscissae are to be taken from A, and the ordinates perpendicular to it.

Since the two values of y are equal, but have opposite signs; PM, and Pm which represent them, must be taken equal to each other on opposite sides of AB; and it is plain that the parts of the curve on the two sides of AB, must be every way similar and equal.

If x is made equal to a , then $y = x \sqrt{\frac{x+b}{0}}$

which is an algebraical expression for infinity; therefore if AC is taken equal to a , the perpendicular CD will become an asymptote to the curve, which will have two infinite arcs (Obs. 2.). If x is greater than a , the quantity under the radical sign becomes negative, and the values of y are impossible; that is, no part of the curve lies beyond CD. (4.)

Both branches of the curve pass through A, since $y=0$, when $x=0$. (1.) Let x be negative, and $y = \pm x$

$$\sqrt{\frac{b-x}{a+x}}$$

the values of y will be possible, if x is not greater than b ; but if $x=b$, then $y=0$, and if x is greater

Application to Geometry.

er than b , the values of y become impossible; that is, if the absciss AP be taken to the left of A , and less than b , there will be two real equal values of y , viz. PM, Pm on the opposite sides as before; if AE be taken equal to b the curve will pass through E , and no part of it is beyond E . (1. and 4.)

If b is negative, then E is to the right of A , which will now be a punctum conjugatum. The rest of the curve will be between E and C , and CD becomes an asymptote.

Application to Geometry.

If $a=0$ then $-xy^2 = x^3 - bx^2$ or $y^2 = bx - x^2$, which is an equation to the circle of which $b=AE$ is the diameter.

II. General Properties of Curves from their Equations.

The general properties of equations lead to the general affections of curve lines. For example,

A straight line may meet a curve in as many points as there are units in the dimension of its equation; for so many roots may that equation have. An asymptote may cut a curve line in as many points, excepting two, as it has dimensions, and no more. The same may be observed of the tangent.

Impossible roots enter an equation by pairs; therefore the intersections of the ordinate and curve must vanish by pairs.

The curves of which the number expressing the order is odd, must have at least two infinite arcs; for the absciss may be so assumed, that, for every value of it, either positive or negative, there must be at least one value of y , &c.

The properties of the coefficients of the terms of equations, mentioned Part II. Chap. I. furnish a great number of the curious and universal properties of curve lines. For example, the second term of an equation is the sum of the roots with the signs changed, and if the second term is wanting, the positive and negative roots must be equal. From this it is easy to demonstrate, "That if each of two parallel straight lines meet a curve line in as many points as it has dimensions, and if a straight line cut these two parallels, so that the sum of the segments of each on one side be equal to the sum of the segments on the other, this straight line will cut any other line parallel to these in the same manner." Analogous properties, with many other consequences from them, may be deduced from the composition of the coefficients of the other terms.

Many properties of a particular order of curves may be inferred from the properties of equations of that order. Thus, "If a straight line cut a curve of the third order in three points, and if another straight line be drawn, making a given angle with the former, and cutting the curve also in three points, the paralleloiped by the segments of one of these lines between its intersection with the other, and the points where it meets the curve, will be to the paralleloiped by the like segments of the other line in a given ratio." This depends upon the composition of the absolute term, and may be extended to curves of any order.

III. The Subdivision of Curves.

As lines are divided into orders from the dimensions of their equations, in like manner, from the varieties of the equations of any order, may different genera and species of that order be distinguished, and from the peculiar properties of these varieties, may the affections of the particular curves be discovered.

For this purpose a complete general equation is assumed of that order, and all the varieties in the terms and coefficients which can affect the figure of the locus are enumerated.

It

The portion between A and E is called a *Nodus*.

If y be put $=0$, then the values of x are $e, 0, -b$. That is, the curve passes twice through A , or A is a punctum duplex, and it passes also through E as before. (1.)

The mechanical description of curves mentioned in the beginning of this section, may be illustrated by the preceding example. For this purpose, let any numerical values of a and b be assumed; and if successive numerical values of x be inserted, corresponding numerical values of y will be obtained, by which so many points in the curve may be constructed.

Let $AC=a=10$; $AE=b=12$; and, first let $x=1$, then $y = \pm x \sqrt{\frac{x+b}{a-x}} = \pm \sqrt{\frac{13}{3}} = \pm 1.2$ nearly, which gives the length of the ordinates when the absciss is 1; and in the same manner are the ordinates to be found when x is 2, 3, or any other number. Thus, if $x=6$, then $y = \pm 6 \times \sqrt{\frac{18}{2}} = 12.73$ nearly; and if AP be taken from the scale of equal parts (according to which AB and AE are supposed to be laid down) and equal to 6, then PM, Pm , being taken from the same scale, each equal to 12.73, will give the points of the curve M, m . In like manner, if $x=-y, y = \pm 9 \sqrt{\frac{3}{19}} = \pm 3.58$, nearly; and if $AP=9$, then PM, Pm being taken from the same scale equal to 3.58, will give the points M, m . In the same manner may any number of points be found, and these being joined, will give a representation of the curve, which will be more or less just, according to the number of points found, and the accuracy of the several operations employed.

By the same methods the locus of any other equation is to be traced: Thus, by varying the former equation, the figure of its locus will be varied. If $b=0$, then the points A and E coincide, the nodus vanishes, and A is called a *cusps*.

Application
to Geo-
metry.

It was formerly observed, that the equations belonging to any one curve, may be of various forms, according to the position of the base, and the angle which the ordinate makes with it, though they be all of the same order, and have also certain properties, which distinguish them from the other equations of that order.

The locus of simple equations is a *straight line*. There are *three* species of lines of the second order, which are easily shown to be the *conic sections*, reckoning the circle and ellipse to be one. *Seventy-eight* species have been numbered of the third order: And as the superior orders become too numerous to be particularly reckoned, it is usual only to divide them into certain general classes.

A complete arrangement of the curves of any order would furnish canons, by which the species of a curve whose equation is of that order might be found.

IV. Of the place of Curves defined from other principles in the Algebraical System.

If a curve line be defined from the section of a solid, or from any rule different from what has been here supposed, an equation to it may be derived, by which its order and species in the algebraical system may be found. And, for this purpose, any base and any angle of the co-ordinates may be assumed, from which the equation may be most easily derived, or may be of the most simple form.

The three *Conic Sections* are of the second order, as their equations are universally quadratic; the *Cissoïd* of the ancients is of the third order, and the 42 species, according to Sir Isaac Newton's enumeration; this is the curve defined by the equation in page 439, col. 1. par. ult. when $b=0$. The curve delineated above in the same page, is the 41st species. When b is negative in that equation, the locus is the 43d species. The *Conchoid* of Nicomedes is of the fourth order; the *Cassinian* curve is also of the fourth order, &c.

It is to be observed, that not only the first definition of a curve may be expressed by an equation, but likewise any of those theorems called *loci*, in which some property is demonstrated to belong to every point of the curve. The expression of these propositions by equations, is sometimes difficult; no general rules can be given; and it must be left to the skill and experience of the learner.

Scholium.

This method of treating curve lines by equations, besides the uses already hinted at, has many others, which do not belong to this place; such are, the finding the tangents of curves, their curvature, their areas and lengths, &c. The solution of these problems has been accomplished by means of the equations to curves, though by employing, concerning them, a method of reasoning different from what has been here explained.

C H A P. III.

I. Construction of the Loci of Equations.

THE description of a curve, according to the definition of it, is assumed in geometry as a *postulate*.

If the properties of a particular curve are investigated, it will appear that it may be described from a

N^o II.

variety of data different from those assumed in the postulate, by demonstrating the dependence of the former upon the latter.

Application
to Geo-
metry.

As the definitions of a curve may be various, so also may be the postulates, and a definition is frequently chosen from the mode of description connected with it. The particular object in view, it was formerly remarked, must determine the proper choice of a definition; the simplicity of it, the ease with which the other properties of the figure may be derived from it, and sometimes even the ease with which it can be executed mechanically, may be considered as important circumstances.

In the straight line, the circle, the conic sections, and a few curves of the higher orders, the most convenient definitions, and the postulates connected with them, are generally known and received. An equation to a curve may also be assumed as a definition of it; and the description of it, according to that definition, may be considered as a postulate: but, if the geometrical construction of problems is to be investigated by means of algebra, it is often useful to deduce from the equation to a curve, those data which, from the geometrical theory of the curve, are known to be necessary to its description in the original postulate, or in any problem founded upon it. This is called *Constructing the locus* of an equation, and from this method are generally derived the most elegant constructions which can be obtained by the use of algebra. In the following section, there is an example of a problem resolved by such constructions.

Sometimes a mechanical description of a curve line defined by an equation is useful; and as the exhibition of it, by such a motion as is supposed in that definition, is rarely practicable, it generally becomes necessary to contrive some more simple motion which may in effect correspond with the other, and may describe the curve with the degree of accuracy which is wanted. Frequently, indeed, the only method which can be conveniently practised, is the finding a number of points in the curve by the resolution of numeral equations, in the manner mentioned in Sect. 1. of this Chapter, and then joining these points by the hand; and though this operation is manifestly imperfect, it is on some occasions useful.

II. Solution of Problems.

The solution of geometrical problems by algebra is much promoted, by describing the loci of the equations arising from these problems.

For this purpose, equations are to be derived, according to the methods formerly described, and then to be reduced to two, containing each the same two unknown quantities. The loci of these equations are to be described, the two unknown quantities being considered as the co-ordinates, and placed at the same angle in both. The co-ordinates at an intersection of the loci, will be common to both, and give a solution of the problem.

The simplicity of a construction obtained by this method, will depend upon a proper notation, and the choice of the equations of which the loci are to be described. These will frequently be different from what would be proper in a different method of solution.

PROB.

Application to Geometry.

Application to Geometry.

PROB. IV. To find a Point F in the Base of the given Triangle ABC, so that the Sum of the Squares of FE, FD drawn from it perpendicular upon the two Sides, may be equal to a given Space.

Draw BH, CG perpendicular on the two sides, and

let $FD = x, FE = y,$
 $BF = z, BC = b,$
 $BH = p, CG = r,$
 and the given space
 $FD^2 + FE^2 = m^2.$

From similar triangles $z : x :: b : r$
 and $z = \frac{bx}{r}.$

Also $b - z : y :: b : p,$
 and $z = b - \frac{yb}{p};$

therefore $\frac{bx}{r} = b - \frac{yb}{p}.$ That is $y = p - \frac{px}{r},$ an equation to a straight line.

But $x^2 + y^2 = m^2$ of which the locus is a circle, having m for the radius. By constructing these loci, their intersection will give a solution of the problem.

Let $KL = CG (=r)$ be at right angles to $LM = BH (=p),$ join KM to which let LN be parallel; LN is the locus of the equation

$y = p - \frac{px}{r};$ for let any

line OPQ be drawn parallel to $LM,$ if KP

$= x,$ then $PQ = \frac{px}{r},$

and $QO = LM = p,$ therefore $PO = y = p - \frac{px}{r}.$

About the centre $K,$ with a distance equal to the line $m,$ let a circle be described; that circle will be the locus of the equation $m^2 = x^2 + y^2;$ for it is plain that if OP be

any perpendicular from the circumference upon $KL,$ KP being $x,$ OP will be $y.$ Either of the points, therefore, in which these two loci intersect each other, as $O,$ will give OP an ordinate in both equations, KP being the common absciss; therefore KP, OP are the two perpendiculars required, from which the point F is easily found.

The construction might have been made on figure 1st, with fewer lines. If the circle touches $LN,$ there is only one solution which is a minimum; and if the circle does not meet $LN,$ the problem becomes impossible.

When the circle touches $LN,$ the radius m must be equal to the perpendicular from K on $LN,$ or from L

on $KM.$ This perpendicular is equal to $\frac{pr}{\sqrt{p^2 + r^2}}$ or a fourth proportional to $MK, KL,$ and $LM,$ and its square therefore is the least sum of the squares of the perpendiculars from a point in the base on the two sides.

It may be remarked also, that the point which gives the sum of the squares a minimum, is found by dividing the base, in the proportion of the squares of the two sides of the triangle; and this is easily demonstrated from the preceding construction.

PROB. V. Between two given Lines to find two mean Proportionals.

Let the lines be a and $b,$ and let the two means be x and $y;$ therefore $a : x : y : b,$ and hence $ay = x^2,$ and $bx = y^2,$ which are both equations to the parabola, and are easily constructed. The co-ordinates at the intersection of these two loci will be the means required.

If one unknown quantity only is assumed, or if it is convenient to deduce a final equation containing only one, the construction of the roots is to be obtained by the method mentioned in the next section.

Scholium.

The constructions of the two preceding problems are geometrical; but it is sometimes convenient to have a practical solution, by the mechanical description either of the algebraical lines employed in the geometrical solution, or of other geometrical lines by which it can be effected. But few of these are tolerably accurate; so that, in general, by means of calculation, the practical operations are all reduced to what may be performed by a ruler and a compass.

III. Construction of Equations.

The roots of an equation, containing only one unknown quantity, may be found by the intersection of lines, the product of whose dimensions is equal to the dimension of that equation. And hence problems are resolved without an algebraical solution of the equation arising from them.

Thus cubic and biquadratic equations may be constructed by the intersections of two conic sections as the circle and parabola, which are generally assumed as being most easily described.

In order to find these constructions, a new equation is to be assumed, containing two variable quantities, one of which is the unknown quantity of the given equation, and the other by substitution is to be inserted also in the given equation; the intersection of the loci of these equations will exhibit the roots required.

Canons may be devised for the construction of particular orders, without assuming the new equation.

The final equation from prob. 5. would be $x^3 = a^2 b,$ which being constructed according to the rules, exhibits the common geometrical solution of that problem by the circle and parabola.

If an equation be assumed, as $ay = x^2,$ the other by substitution becomes $xy = ab;$ the locus of the former is a parabola, and of the latter an hyperbola, one of its asymptotes being the base, and the co-ordinates at their intersection will represent x and $y;$ the first of the two means is $x,$ and in this case y is the other.

Application
to Geo-
metry.

Equations also might be assumed so as to give a solution of this problem by other combinations of two of the conic sections, one of them not being the circle.

As geometrical magnitudes may be represented by algebra, so algebraical quantities and numbers may be represented by lines. Hence this construction of equations has sometimes been used as an easy method of approximation to the roots of numeral equations. For this purpose, the necessary straight lines must be laid down by means of a scale of equal parts, and the curve lines, on whose intersection the construction depends, must be actually described; the linear roots being measured on the scale will give the numbers required. These operations may be performed with sufficient accuracy for certain purposes; but as they depend on mechanical principles, the approximation obtained by them cannot be continued at pleasure; and hence it is

feldom used, except in finding the first step of an approximation, which is to be carried on by other methods.

Application
to Geo-
metry.

Scholium.

If the relation between the ordinate and absciss be fixed, but not expressible by a finite equation, the curve is called *Mechanical* (A) or *Transcendental*. This class is also sometimes defined by equations, by supposing either x or y in a finite equation to be a curve line, of which the relation to a straight line cannot be expressed in finite terms.

If the variable quantities x or y enter the exponents of any term of an equation, the locus of that equation is called an *Exponential Curve*.

Many properties of these two classes of curves may be discovered from their equations.

Algedo
||
Algiabarii.

ALGEDO, the running of a gonorrhœa stopping suddenly after it appears. When it thus stops, a pain reaches to the anus, or to the testicles, without their being swelled; and sometimes this pain reaches to the bladder; in which case there is an urging to discharge the urine, which is with difficulty passed, and in very small quantities at a time. The pain is continued to the bladder by the urethra; to the anus, by the acceleratory muscles of the penis; and to the testicles, by the vasa deferentia, and vesiculæ feminales. In this case, calomel repeated so as to purge, brings back the running, and then all difficulty from this symptom ceases.

ALGENEB, a fixed star, of the second magnitude, in Perseus's right side; its longitude is $27^{\circ} 46' 12''$ of Taurus, and its latitude $36^{\circ} 05' 28''$ north, according to Mr Flamsteed's catalogue.

ALGEZIRA, a town of Andalusia in Spain, with a port on the coast of the Straits of Gibraltar. By this city the Moors entered Spain in 713; and it was taken from them in 1344, after a very long siege, remarkable for being the first in which cannon were made use of. It was called *Old Gibraltar*, and is about four leagues from the New. W. Long. 5. 2. N. Lat. 36. 0.

ALGHIER, or **ALGERI**, a town in Sardinia, with a bishop's see, upon the western coast of the island, between Safferi and Bofa. Though it is not large, it is well peopled, and has a commodious port. The coral fished for on this coast is in the highest esteem of any in the Mediterranean. W. Long. 4. 2. Lat. 36. 0.

ALGIABARII, a Mahometan sect of predestinarians, who attribute all the actions of men, good or evil, to the agency or influence of God. The Algiabarii stand opposed to the **ALKADARII**. They hold absolute degrees and physical premotion. For the justice of God in punishing the evil he has caused, they resolve it wholly into his absolute dominion over the creatures.

A L G

ALGIERS, a kingdom of Africa, now one of the states of Barbary.—According to the latest and best computations, it extends 460 miles in length from east to west, and is very unequal in breadth; some places being scarce 40 miles broad, and others upwards of 100. It lies between Long. 0. 16. and 9. 16. W. and extends from Lat. 36. 55. to 44. 50. N.—It is bounded on the north, by the Mediterranean; on the east, by the river Zaine, the ancient Tusca, which divides it from Tunis; on the west, by the Mulvya, and the mountains of Trava, which separate it from Morocco; and on the south by the Sahara, Zaara, or Numidian desert.

Algiers.

The climate of Algiers is in most places so moderate, that they enjoy a constant verdure; the leaves of the trees being neither parched up by heat in summer, nor nipped by the winter's cold. They begin to bud in February; in April the fruit appears in its full bigness, and is commonly ripe in May. The soil, however, is excessively various; some places being very hot, dry, and barren, on which account they are generally suffered to lie uncultivated by the inhabitants, who are very negligent. These barren places, especially such as lie on the southern side, and are at a great distance from the sea, harbour vast numbers of wild creatures, as lions, tigers, buffaloes, wild boars, stags, porcupines, monkeys, ostriches, &c. On account of their barrenness, they have but few towns, and those thinly peopled; though some of them are so advantageously situated for trading with Bildulgerid and Negroland, as to drive a considerable traffic with them.

The Algerine kingdom made formerly a considerable part of the Mauritania Tingitana (See MAURITANIA), which was reduced to a Roman province by Julius Cæsar, and from him also called *Mauritania Cæsariensis*.—In the general account of Africa, it has been noticed, that the Romans were driven out of that continent by the Vandals; these by Belisarius, the Greek emperor Justinian's general; and the Greeks in their turn by the Saracens. This last revolution happened

(A) The term *Mechanical*, in this place, is used merely as the name of a particular class of curves, without implying that they have any more dependence on the principles of Mechanics or Physics than the algebraical curves which have been treated of.

Algiers. happened about the middle of the seventh century; and the Arabs continued masters of the country, divided into a great number of petty kingdoms or states, under chiefs of their own choosing, till the year 1051.

² Abu-Textefien subdued the Arab princes. This year, one Abubeker-ben-Omar, or, as the Spanish authors call him, *Abu-Textefien*, an Arab of the Zinhagian tribe, being provoked at the tyranny of those despots, gathered, by the help of his marabouts or fairs, a most powerful army of malcontents, in the southern provinces of Numidia and Libya. His followers were nicknamed *Marabites* or *Morabites*; by the Spaniards, *Almoravides*; probably from their being assembled principally by the fairs who were also called *Morabites*. The khalif of Kayem's forces were at this time taken up with quelling other revolts in Syria, Mesopotamia, &c. and the Arabs in Spain engaged in the most bloody wars; so that Textefien having nothing to fear from them, had all the success he could wish against the Arabian cheyks or petty tyrants, whom he defeated in many battles, and at last drove them not only out of Numidia and Libya, but out of all the western parts, reducing the whole province of Tingitania under his dominion.

Textefien was succeeded by his son Yusef, or Joseph, a brave and warlike prince. In the beginning of his reign, he laid the foundation of the city of Morocco, which he designed to make the capital of his empire. While that city was building, he sent some of his marabouts ambassadors to Tremecen (now a province of Algiers), at that time inhabited by a powerful and insolent sect of Mahometans called *Zeneti*. The design of this embassy was to bring them back to what he called the *true faith*; but the *Zeneti*, despising his offers, assembled at Amaf, or Amfa, their capital, murdered the ambassadors, and invaded Joseph's dominions with an army of 50,000 men.

³ Zeneti destroyed. The king hearing of their infamous proceedings, speedily mustered his army, and led it by long marches into their country, destroying all with fire and sword; while the *Zeneti*, instead of opposing his progress, retired as fast as possible towards Fez, in hopes of receiving assistance from thence. In this they were miserably deceived: the Fezzans marched out against them in a hostile manner; and coming up with the unhappy *Zeneti*, encumbered with their families and baggage, and ready to expire with hunger and weariness, they cut them all to pieces, except a small number who were mostly drowned in attempting to swim across a river, and some others who in their flight perished by falling from the high adjacent rocks. In the mean time Joseph reduced their country to a mere desert: which was, however, soon peopled by a numerous colony of Fezzans, who settled there under the protection of the reigning kings. In this war it is computed that near a million of the *Zeneti*, men, women, and children, lost their lives.

The restless and ambitious temper of Joseph did not let him remain long at peace. He quickly declared war against the Fezzans, reduced them to become his tributaries, and extended his conquests all along the Mediterranean. He next attacked some Arabian cheyks who had not yet submitted to his jurisdiction; and pursued them with such fury, that neither the Libyan deserts, nor ridges of the most craggy rocks, could shelter them from his arms. He attacked them in such of

their retreats, castles, and fortresses, as were till then deemed impregnable; and at last subdued them, to the great grief of the other African nations, who were greatly annoyed by the ravages committed by his numerous forces.

Thus was founded the empire of the Morabites: which, however, was of no long duration; that race being in the 12th century driven out by Mohavedin, a marabout. This race of priests was expelled by Abdulac governor of Fez; and he, in the 13th century, stripped of his new conquests by the Sharifs of *Hafcen*, the descendants of those Arabian princes whom Abu-Textefien had formerly expelled.

The better to secure their new dominions, the Sharifs divided them into several little kingdoms or provinces; and among the rest the present kingdom of Algiers was divided into four, namely, *Tremecen*, *Tenez*, *Algiers proper*, and *Bujeyah*. The four first monarchs laid so good a foundation for a lasting balance of power between their little kingdoms, that they continued for some centuries in mutual peace and amity; but at length the king of Tremecen having ventured to violate some of their articles, Abul-Farez, king of Tenez, declared war against him, and obliged him to become his tributary. This king dying soon after, and having divided his kingdom among his three sons, new discords arose; which Spain taking advantage of, a powerful fleet and army was sent against Barbary, under the Count of Navarre, in 1505. This commander soon made himself master of the important cities of Oran, Bujeyah, and some others; which so alarmed the Algerines, that they put themselves under the protection of Selim Eutemi, a noble and warlike Arabian prince. He came to their assistance with a great number of his bravest subjects, bringing with him his wife Zaphira, and a son then about 12 years old. This however was not sufficient to prevent the Spaniards from landing a number of forces near Algiers that same year, and obliging that metropolis to become tributary to Spain. Nor could Prince Selim hinder them from building a strong fort on a small island opposite to the city, which terrified their corsairs from sailing either in or out of the harbour.

To this galling yoke the Algerines were obliged to submit till the year 1516; when, hearing of the death of Ferdinand king of Spain, they sent an embassy to *Aruch Barbarossa*, who was at this time no less dreaded for his valour than his surprising success, and was then sent on a cruise with a squadron of galleys and barks. The purport of the embassy was, that he should come and free them from the Spanish yoke; for which they agreed to pay him a gratuity answerable to so great a service. Upon this Barbarossa immediately dispatched 18 galleys and 30 barks to the assistance of the Algerines; while he himself advanced towards the city with 800 Turks, 3000 Jigelites, and 2000 Moorish volunteers. Instead of taking the nearest road to Algiers, he directed his course towards *Sbarsbel*, where *Hassan*, another famed corsair, had settled himself. Him he surprised, and obliged to surrender; not without a previous promise of friendship: but no sooner had Barbarossa got him in his power, than he cut off his head; and obliged all Hassan's Turks to follow him in his new expedition.

On Barbarossa's approach to Algiers, he was met by prince

Algiers.
7
His treachery and cruelty.

prince Eutemi, attended by all the people of that metropolis, great and small; who looked for deliverance from this abandoned villain, whom they accounted invincible. He was conducted into the city amidst the acclamations of the people, and lodged in one of the noblest apartments of prince Eutemi's palace, where he was treated with the greatest marks of distinction. Elated beyond measure with this kind reception, Barbarossa formed a design of becoming king of Algiers; and fearing some opposition from the inhabitants, on account of the excesses he suffered his soldiers to commit, murdered prince Eutemi, and caused himself to be proclaimed king; his Turks and Moors crying out as he rode along the streets, "Long live King Aruch Barbarossa, the invincible king of Algiers, the *chosen of God* to deliver the people from the oppression of the Christians; and destruction to all that shall oppose, or refuse to own him as their lawful sovereign." These last threatening words so intimidated the inhabitants, already apprehensive of a general massacre, that he was immediately acknowledged king. The unhappy princess Zaphira, it is said, poisoned herself, to avoid the brutality of this new king, whom she unsuccessfully endeavoured to stab with a dagger.

Barbarossa was no sooner seated on the throne, than he treated his subjects with such cruelty, that they used to shut up their houses and hide themselves when he appeared in public. In consequence of this, a plot was soon formed against him; but being discovered, he caused twenty of the principal conspirators to be beheaded, their bodies to be buried in a dunghill, and laid a heavy fine on those who survived. This so terrified the Algerines, that they never afterwards durst attempt any thing against either Barbarossa or his successors.

In the mean time, the son of prince Eutemi having fled to Oran, and put himself under the protection of the marquis of Gomarez, laid before that nobleman a plan for putting the city of Algiers into the hands of the king of Spain. Upon this, young Selim Eutemi was sent to Spain, to lay his plan before cardinal Ximenes; who having approved of it, sent a fleet with 10,000 land forces, under the command of *Don Francisco*, or, as others call him, *Don Diego de Vera*, to drive out the Turks, and restore the young prince. But the fleet was no sooner come within sight of land, than it was dispersed by a storm, and the greatest part of the ships dashed against the rocks. Most of the Spaniards were drowned; and the few who escaped to shore were either killed by the Turks or made slaves.

Though Barbarossa had nothing to boast on this occasion, his pride and insolence were now swelled to such a degree, that he imagined himself invincible, and that the very elements conspired to make him so. The Arabians were so much alarmed at his success, that they implored the assistance of Hamidel Abdes king of Tenez, to drive the Turks out of Algiers. That prince readily undertook to do what was in his power for this purpose, provided they agreed to settle the kingdom on himself and his descendants. This proposal being accepted, he immediately set out at the head of 10,000 Moors; and, upon his entering the Algerine dominions, was joined by all the Arabians in the country. Barbarossa engaged him, only with 1000 Turkish musqueteers and 500 Granada Moors; totally defeated his numerous army; pursued him to the very gates of his

capital, which he easily made himself master of; and, having given it up to be plundered by his Turks, obliged the inhabitants to acknowledge him as their sovereign. This victory, however, was chiefly owing to the advantage which his troops had from their fire-arms; the enemy having no other weapons than arrows and javelins.

No sooner was Barbarossa become master of the kingdom of Tenez, than he received an embassy from the inhabitants of Tremecen; inviting him to come to their assistance against their then reigning prince, with whom they were dissatisfied on account of his having dethroned his nephew, and forced him to fly to Oran; offering him even the sovereignty, in case he accepted of their proposal. The king of Tremecen, not suspecting the treachery of his subjects, met the tyrant with an army of 6000 horse and 3000 foot: but Barbarossa's artillery gave him such an advantage, that the king was at length forced to retire into the capital; which he had no sooner entered, than his head was cut off, and sent to Barbarossa, with a fresh invitation to come and take possession of the kingdom. On his approach, he was met by the inhabitants, whom he received with great complaisance, and many fair promises; but beginning to tyrannize as usual, his new subjects soon convinced him that they were not so passive as the inhabitants of Algiers. Apprehending, therefore, that his reign might prove uneasy and precarious, he entered into an alliance with the king of Fez; after which, he took care to secure the rest of the cities in his new kingdom, by garrisoning them with his own troops. Some of these, however, revolted soon after; upon which he sent one of his corsairs, named *Escander*, a man no less cruel than himself, to reduce them. The Tremecenians now began to repent in good earnest of their having invited such a tyrant to their assistance; and held consultations on the most proper means of driving him away, and bringing back their lawful prince *Abuchen Men*: but their cabals being discovered, a great number of the conspirators were massacred in the most cruel manner. The prince had the good luck to escape to Oran, and was taken under the protection of the marquis of Gomarez, who sent immediate advice of it to Charles V. then lately arrived in Spain, with a powerful fleet and army. That monarch immediately ordered the young king a succour of 10,000 men, under the command of the governor of Oran; who, under the guidance of Abuchen Men, began his march towards Tremecen; and in their way they were joined by prince Selim, with a great number of Arabs and Moors. The first thing they resolved upon was, to attack the important fortrefs of *Calau*, situated between Tremecen and Algiers, and commanded by the corsair *Escander* at the head of about 300 Turks. They invested it closely on all sides, in hopes Barbarossa would come out of Tremecen to its relief, which would give the Tremecenians an opportunity of keeping him out. That tyrant, however, kept close in his capital, being embarrassed by his fears of a revolt, and the politic delays of the king of Fez, who had not sent the auxiliaries he promised. The garrison of *Calau*, in the mean time, made a brave defence; and, in a fally they made at night, cut off near 300 Spaniards. This encouraged them to venture a second time; but they were now repulsed with great loss, and *Escander* himself wounded:

^{Algiers.} soon after which, they surrendered upon honourable terms; but were all massacred by the Arabians, except 16, who clung close to the stirrups of the king, and of the Spanish general.

Barbarossa being now informed that Abuchen Men, with his Arabs, accompanied by the Spaniards, were in full march to lay siege to Tremecen, thought proper to come out, at the head of 1500 Turks and 5000 Moorish horse, in order to break his way through the enemy; but he had not proceeded far from the city, before his council advised him to return and fortify himself in it. This advice was now too late; the inhabitants being resolved to keep him out, and open their gates to their own lawful prince as soon as he appeared. In this distress Barbarossa saw no way left but to retire to the citadel, and there defend himself till he could find an opportunity of stealing out with his men and all his treasure. Here he defended himself vigorously; but his provisions failing him, he took advantage of a subterraneous back-way, which he had caused to be digged up for that purpose, and, taking his immense treasure with him, stole away as secretly as he could. His flight, however, was soon discovered; and he was so closely pursued, that to amuse, as he hoped, the enemy, he caused a great deal of his money, plate, jewels, &c. to be scattered all the way, thinking they would not fail to stop their pursuit to gather it up. This stratagem, however, failed, through the vigilance of the Spanish commander, who being himself at the head of the pursuers, obliged them to march on, till he was come up close to him on the banks of the *Hueda*, about eight leagues from Tremecin. Barbarossa had just crossed the river with his vanguard, when the Spaniards came up with his rear on the other side, and cut them all off; and then crossing the water, overtook him at a small distance from it. Here a bloody engagement ensued, in which the Turks fought like as many lions; but, being at length overpowered by numbers, they were all cut to pieces, and Barbarossa among the rest, in the 44th year of his age, and four years after he had raised himself to the royal title of *Jigel* and the adjacent country; two years after he had acquired the sovereignty of Algiers, and scarce a twelvemonth after the reduction of Tremecen. His head was carried to Tremecen, on the point of a spear; and Abuchen Men proclaimed king, to the joy of all the inhabitants. A few days after the fight, the king of Fez made his appearance at the head of 20,000 horse, near the field of battle; but hearing of Barbarossa's defeat and death, marched off with all possible speed, to avoid being attacked by the enemy.

⁸ Barbarossa defeated and killed by the Spaniards.

⁹ Succeeded by Hayradin.

The news of Barbarossa's death spread the utmost consternation among the Turks at Algiers; however, they caused his brother Hayradin to be immediately proclaimed king. The Spanish commander now sent back the emperor's forces, without making any attempt upon Algiers; by which he lost the opportunity of driving the Turks out of that country; while Hayradin, justly dreading the consequences of the tyranny of his officers, sought the protection of the Grand Signior. This was readily granted, and himself appointed bashaw or viceroy of Algiers; by which means he received such considerable reinforcements, that the unhappy Algerines durst not make the least complaint; and such numbers of Turks resorted to him, that he

was not only capable of keeping the Moors and Arabs in subjection at home, but of annoying the Christians at sea. His first step was to take the Spanish fort above-mentioned, which was a great nuisance to his metropolis. The Spaniards held out to the last extremity; but being all slain or wounded, Hayradin easily became master of the place.

Hayradin next set about building a strong mole for the safety of his ships. In this he employed 30,000 Christian slaves, whom he obliged to work without intermission for three years; in which time the work was completed. He then caused the fort he had taken from the Spaniards to be repaired, and placed a strong garrison in it, to prevent any foreign vessels from entering the harbour without giving an account of themselves. By these two important works, Hayradin soon became dreaded not only by the Arabs and Moors, but also by the maritime Christian powers, especially the Spaniards. The viceroy failed not to acquaint the Grand Signior with his success, and obtained from him a fresh supply of money, by which he was enabled to build a stronger fort, and to erect batteries on all places that might favour the landing of an enemy. All these have since received greater improvements from time to time, as often as there was occasion for them.

In the mean time the Sultan, either out of a sense of the great services Hayradin had done, or perhaps out of jealousy lest he should make himself independent, raised Hayradin to the dignity of bashaw of the empire, and appointed Hassan Aga, a Sardinian renegade, an intrepid warrior, and an experienced officer, to succeed him as bashaw of Algiers. Hassan had no sooner taken possession of his new government, than he began to pursue his ravages on the Spanish coast with greater fury than ever; extending them to the ecclesiastical state, and other parts of Italy. But Pope Paul III. being alarmed at this, exhorted the emperor Charles V. to send a powerful fleet to suppress those frequent and cruel piracies; and, that nothing might be wanting to render the enterprise successful, a bull was published by his holiness, wherein a plenary absolution of sins, and the crown of martyrdom, was promised to all those who either fell in battle or were made slaves; the emperor on his part needed no spur; and therefore set sail at the head of a powerful fleet consisting of 120 ships and 20 galleys, having on board 30,000 chosen troops, an immense quantity of money, arms, ammunition, &c. In this expedition many young nobility and gentry attended as volunteers, and among these many knights of Malta, so remarkable for their valour against the enemies of Christianity. Even ladies of birth and character attended Charles in his expedition, and the wives and daughters of the officers and soldiers followed them with a design to settle in Barbary after the conquest was finished. All these meeting with a favourable wind, soon appeared before Algiers; every ship displaying the Spanish colours on the stern, and another at the head, with a crucifix to serve them for a pilot.

By this prodigious armament, the Algerines were thrown into the utmost consternation. The city was surrounded only by a wall with scarce any outworks. The whole garrison consisted of 800 Turks and 6000 Moors, without fire-arms, and poorly disciplined and accoutred; the rest of their forces being dispersed in

the other provinces of the kingdom, to levy the usual tribute on the Arabs and Moors. The Spaniards landed without opposition, and immediately built a fort, under the cannon of which they encamped, and diverted the course of a spring which supplied the city with water. Being now reduced to the utmost distress, Hassan received a summons to surrender at discretion, on pain of being put to the sword with all the garrison. The herald was ordered to extol the vast power of the emperor both by sea and land, and to exhort him to return to the Christian religion. But to this Hassan only replied, that he must be a madman who would pretend to advise an enemy, and that the advised must still act more madly who would take counsel of such an adviser. He was, however, on the point of surrendering the city, when advice was brought him that the forces belonging to the western government were in full march towards the place; upon which it was resolved to defend it to the utmost. Charles, in the mean time, resolving upon a general assault, kept a constant firing upon the town; which, from the weak defence made by the garrison, he looked upon as already in his hands. But while the *douwan*, or Algerine senate, were deliberating on the most proper means of obtaining an honourable capitulation, a mad prophet, attended by a multitude of people, entered the assembly, and foretold the speedy destruction of the Spaniards before the end of the moon, exhorting the inhabitants to hold out till that time. This prediction was soon accomplished in a very surprising and unexpected manner: for, on the 28th of October 1541, a dreadful storm of wind, rain, and hail, arose from the north, accompanied with violent shocks of earthquakes, and a dismal and universal darkness both by sea and land; so that the sun, moon, and elements, seemed to combine together for the destruction of the Spaniards. In that one night, some say in less than half an hour, 86 ships and 15 galleys were destroyed, with all their crews and military stores; by which the army on shore was deprived of all means of subsisting in these parts. Their camp also, which spread itself along the plain under the fort, was laid quite under water by the torrents which descended from the neighbouring hills. Many of the troops, by trying to remove into some better situation, were cut in pieces by the Moors and Arabs; while several galleys, and other vessels, endeavouring to gain some neighbouring creeks along the coasts, were immediately plundered, and their crews massacred by the inhabitants.

16
Siege of Al-
giers raised.

The next morning Charles beheld the sea covered with the fragments of so many ships, and the bodies of men, horses, and other creatures, swimming on the waves; at which he was so disheartened, that abandoning his tents, artillery, and all his heavy baggage, to the enemy, he marched at the head of his army, though in no small disorder, towards cape *Malabux*, in order to reembark in those few vessels which had outweathered the storm. But Hassan, who had caused his motions to be watched, allowed him just time to get to the shore, when he sallied out and attacked the Spaniards in the midst of their hurry and confusion to get into their ships, killing great numbers, and bringing away a still greater number of captives; after which he returned in triumph to Algiers, where he celebrated with great rejoicings his happy deliverance from such distress and danger.

Soon after this, the prophet *Yusef*, who had foretold the destruction of the Spaniards, was not only declared the deliverer of his country, but had a considerable prophetic function unmolested. It was not long, however, before the marabouts, and some interpreters of the law, made a strong opposition against him; remonstrating to the bashaw, how ridiculous and scandalous it was to their nation, to ascribe the deliverance of it to a poor fortune-teller, which had been obtained by the fervent prayers of an eminent saint of their own profession. But though the bashaw and his douwan seemed, out of policy, to give into this last notion, yet the impression which Yusef's predictions and their late accomplishments had made upon the minds of the common people, proved too strong to be eradicated; and the spirit of divination and conjuring has since got into such credit among them, that not only their great statesmen, but their priests, marabouts, and fantoons, have applied themselves to that study, and dignified it with the name of *Mahomet's Revelations*.

17
The mad
prophet re-
warded.

The unhappy Spaniards had scarce reached their ships, when they were attacked by a fresh storm, in which several more of them perished; one ship in particular, containing 700 soldiers, besides sailors, sunk in the emperor's sight, without a possibility of saving a single man. At length, with much labour, they reached the port of *Bujeyah*, at that time possessed by the Spaniards, whither Hassan king of Tunis soon after repaired, with a supply of provisions for the emperor, who received him graciously, with fresh assurances of his favour and protection. Here he dismissed the few remains of the Maltese knights and their forces, who embarked in three shattered galleys, and with much difficulty and danger reached their own country. Charles himself staid no longer than till the 16th of November, when he set sail for Carthage, and reached it on the 25th of the same month. In this unfortunate expedition upwards of 120 ships and galleys were lost, above 300 colonels and other land and sea officers, 8000 soldiers and marines, besides those destroyed by the enemy on the reembarkation, or drowned in the last storm. The number of prisoners was so great, that the Algerines sold some of them, by way of contempt, for an onion per head.

18
Fresh cala-
mities of the
Spaniards.

Hassan, elated with this victory, in which he had very little share, undertook an expedition against the king of Tremecen, who, being now deprived of the assistance of the Spaniards, was forced to procure a peace by paying a vast sum of money, and becoming tributary to him. The bashaw returned to Algiers, laden with riches; and soon after died of a fever, in the 66th year of his age.

duces Tre-
mecen.

From this time the Spaniards were never able to annoy the Algerines in any considerable degree. In 1555, they lost the city of *Bujeyah*, which was taken by *Salha Rais*, Hassan's successor; who next year set out on a new expedition, which he kept a secret, but was suspected to be intended against Oran: but he was scarcely got four leagues from Algiers, when the plague, which at that time raged violently in the city, broke out in his groin, and carried him off in 24 hours.

Algiers. He did not accept of the bashawship without a good deal of difficulty; but immediately prosecuted the intended expedition against Oran, dispatching a messenger to acquaint the Porte with what had happened. They had hardly begun their hostilities against the place, when orders came from the Porte, expressly forbidding Hassan Corfo to begin the siege, or, if he had begun it, enjoining him to raise it immediately. This news was received with great grief by the whole fleet and army, as they thought themselves sure of success, the garrison being at that time very weak. Nevertheless, as they dared not disobey, the siege was immediately raised.

²² **Superfeded by Tekelli, who puts him to a cruel death.** Corfo had hardly enjoyed his dignity four months, before news came, that eight galleys were bringing a new bashaw to succeed him; one *Tekelli*, a principal Turk of the Grand Signior's court: upon which the Algerines unanimously resolved not to admit him. By the treachery of the Levantine soldiers, however, he was admitted at last, and the unfortunate Corfo thrown over a wall in which a number of iron hooks were fixed; one of which catching the ribs of his right side, he hung three days in the most exquisite torture before he expired.

Tekelli was no sooner entered upon his new government, than he behaved with such cruelty and rapaciousness, that he was assassinated even under the dome of a faint, by Yusuf Calabres, the favourite renegado of Hassan Corfo; who for this service was unanimously chosen bashaw, but died of the plague six days after his election.

²² **Hassan reinstated.** Yusuf was succeeded by Hassan the son of Hayradin, who had been formerly recalled from his bashawship, when he was succeeded by Selha-Rais; and now had the good fortune to get himself reinstated in his employment. Immediately on his arrival, he engaged in a war with the Arabs, by whom he was defeated with great loss. The next year, the Spaniards undertook an expedition against Mostagan, under the command of the count d'Alcandela; but were utterly defeated, the commander himself killed, and 12,000 taken prisoners. This disaster was owing to the inconsiderate rashness, or rather madness, of the commander; which was so great, that, after finding it impossible to rally his scattered forces, he rushed, sword in hand, into the thickest of the enemy's ranks, at the head of a small number of men, crying out, "St Jago! St Jago! the victory is ours, the enemy is defeated;" soon after which he was thrown from his horse, and trampled to death.

²⁴ **Spaniards defeated with great slaughter.** Hassan having had the misfortune to disoblige his subjects by allowing the mountaineers of Cuco to buy ammunition at Algiers, was sent in irons to Constantinople, while the aga of the Janisaries, and general of the land forces, supplied his place.—Hassan easily found means to clear himself; but a new bashaw was appointed, called Achmet; who was no sooner arrived, than he sent the two deputy-bashaws to Constantinople, where their heads were struck off.—Achmet was a man of such insatiable avarice, that, upon his arrival at Algiers, all ranks of people came in shoals to make him presents; which he the more greedily accepted, as he had bought his dignity by the money he had amassed while head gardener to the Sultan. He enjoyed it, however, only four months; and after his death, the state was governed other four months by his lieutenant;

²⁵ **Hassan sent in irons to Constantinople.**

when Hassan was a third time sent viceroy to Algiers, where he was received with the greatest demonstrations of joy.

The first enterprize in which Hassan engaged, was the siege of Marsalquiver, situated near the city Oran, which he designed to invest immediately after. The army employed in this siege consisted of 26,000 foot and 10,000 horse, besides which he had a fleet consisting of 32 galleys and galliots, together with three French vessels laden with biscuit, oil, and other provisions. The city was defended by Don Martin de Cordova, brother of the Count d'Alcandela, who had been taken prisoner in the battle where that nobleman was killed, but had obtained his liberty from the Algerines with immense sums, and now made a most gallant defence against the Turks. The city was attacked with the utmost fury by sea and land, so that several breaches were made in the walls. The Turkish standards were several times planted on the walls, and as often dislodged; but the place must have in the end submitted, had not Hassan been obliged to raise the siege in haste, on the news that the famed Genoese admiral Doria was approaching with considerable succours from Italy. The fleet accordingly arrived soon after; but missing the Algerine galleys, bore away for Pennon de Velez, where they were shamefully repulsed by an handful of Turks who garrisoned that place; which, however, was taken the following year.

²⁶ **Algiers.** Reinflated. ²⁷ **Siege of Marsalquiver.**
 In 1567, Hassan was again recalled to Constantinople, where he died three years after. He was succeeded by Mahomet, who gained the love of the Algerines by several public-spirited actions. He incorporated the Janisaries and Levantine Turks together, and by that means put an end to their dissensions, which laid the foundation of the Algerine independency on the Porte. He likewise added some considerable fortifications to the city and castle, which he designed to render impregnable. But while he was thus studying the interest of Algiers, one John Gascon, a bold Spanish adventurer, formed a design of surprising the whole piratic navy in the bay, and setting them on fire in the night-time, when they lay defenceless, and in their first sleep. For this he had not only the permission of king Philip II. but was furnished by him with proper vessels, mariners, and fireworks, for the execution of his plot. With these he set sail for Algiers in the most proper season, viz. the beginning of October, when most, if not all the ships lay at anchor there; and easily failed near enough, unsuspected, to view their manner of riding, in order to catch them napping, at a time when the greater part of their crew were dispersed in their quarters. He came accordingly, unperceived by any, to the very mole-gate, and dispersed his men with their fire-works; but to their great surprize, they found them so ill mixed, that they could not with all their art make them take fire. In the mean time, Gascon took it into his head, by way of bravado, to go to the mole-gate, and give three loud knocks at it with the pommel of his dagger, and to leave it fixed in the gate by its point, that the Algerines might have cause to remember him. This he had the good fortune to do without meeting with any disturbance or opposition: but it was not so with his men; for no sooner did they find their endeavours unsuccessful, than they made such a bustle as quickly alarmed the guard posted on the adjacent

²⁸ **Constantinople.** He was recalled. ²⁹ **John Gascon's bold attempt to fire the Algerine fleet.** ³⁰ **His bravado at the city gate.**

Algiers. ³¹ Is taken and put to death. jacent bastion, from which the uproar quickly spread itself thro' the whole garrison. Gascon, now finding himself in the utmost danger, sailed away with all possible haste: but he was pursued, overtaken, and brought back a prisoner to Mahomet; who no sooner got him into his power, than he immediately caused a gibbet of considerable height to be erected on the spot where Gascon had landed, ordering him to be hoisted up, and hung by the feet to a hook, that he might die in exquisite torture; and to show his resentment and contempt of the king his master, he ordered his commission to be tied to his toes. He had not, however, hung long in that state, when the captain who took him, accompanied by a number of other corsairs, interceded so strongly in his behalf, that he was taken down, and put under the care of some Christian surgeons; but two days after, some Moors reporting that it was the common talk and belief in Spain, that the Algerines durst not hurt a hair of Gascon's head, &c. the unfortunate Spaniard was hoisted up by a pulley to the top of the execution-wall, and let down again upon the hook, which in his fall caught him by the belly, and gave him such a wound, that he expired without a groan.—Thus ended the expedition of John Gascon, which has procured him a place among the Spanish martyrs; while, on the other hand, the Algerines look upon his disappointment to have been miraculous, and owing to the efficacious protection of the powerful saint *Sidi Outededda*, whose prayers had before raised such a terrible storm against the Spanish fleet.

Mahomet, being soon after recalled, was succeeded by the famous renegado Ochali, who reduced the kingdom of Tunis; which, however, remained subject to the viceroy of Algiers only till the year 1586, when a bashaw of Tunis was appointed by the Porte.

The kingdom of Algiers continued to be governed, till the beginning of the seventeenth century, by viceroys or bashaws appointed by the Porte; concerning whom we find nothing very remarkable, further than that their avarice and tyranny was intolerable both to the Algerines and the Turks themselves. At last the Turkish Janisaries and militia becoming powerful enough to suppress the tyrannic sway of these bashaws, and the people being almost exhausted by the heavy taxes laid upon them, the former resolved to depose these petty tyrants, and set up some officers of their own at the head of the realm. The better to succeed in this attempt, the militia sent a deputation of some of their chief members to the Porte, to complain of the avarice and oppression of these bashaws, who sunk both the revenue of the state, and the money remitted to it from Constantinople, into their own coffers, which should have been employed in keeping up and paying the soldiery; by which means they were in continual danger of being overpowered by the Arabians and Moors, who, if ever so little assisted by any Christian power, would hardly fail of driving all the Turks out of the kingdom. They represented to the Grand Vizir how much more honourable, as well as easier and cheaper, it would be for the Grand Signior to permit them to choose their own dey, or governor, from among themselves, whose interest it would then be to see that the revenue of the kingdom was rightly applied in keeping up its forces complete, and in supplying all other exigencies of the state, without any farther charge

Nº 12.

Algiers. or trouble to the Porte than that of allowing them its protection. On their part, they engaged always to acknowledge the Grand Signiors as their sovereigns, and to pay them their usual allegiance and tribute, to respect their bashaws, and even to lodge and maintain them and their retinue, in a manner suitable to their dignity, at their own charge. The bashaws, however, were, for the future, to be excluded from assisting at any but general douwans, unless invited to it; and from having the liberty of voting in them, unless when their advice was asked, or the interest of the Porte was likely to suffer by their silence. All other concerns, which related to the government of Algiers, were to be wholly left under the direction of the dey and his douwan.

These proposals having been accepted by the Porte, ³² the deputies returned highly satisfied; and having notified their new privileges, the great *douwan* immediately proceeded to the election of a dey from among themselves. They compiled a new set of laws, and made several regulations for the better support and maintenance of this new form of government, to the observation of which they obliged all their subjects to swear; and the militia, navy, commerce, &c. were all settled pretty nearly on the footing upon which they now are, and which shall be afterwards described; tho' the subsequent altercations that frequently happened between the bashaws and deys, the one endeavouring to recover their former power, and the other to curtail it, caused such frequent complaints and discontents at the Ottoman court, as made them frequently repent their compliance.

In the year 1601, the Spaniards, under the command of Doria the Genoese admiral, made another attempt upon Algiers, in which they were more fortunate than usual, their fleet being only driven back by contrary winds, so that they came off without loss. In 1609, the Moors being expelled from Spain, flocked in great numbers to Algiers; and as many of them were very able sailors, they undoubtedly contributed to make the Algerine fleet so formidable as it became soon after; tho' it is probable the frequent attempts made ³³ on their city would also induce them to increase their fleet. In 1616, their fleet consisted of 40 sail of ships between 200 and 400 tons, their admiral 500 tons. It was divided into two squadrons, one of 18 sail, before the port of Malaga; and the other at the Cape of Santa Maria, between Lisbon and Seville; both of which fell foul on all Christian ships, both English and French, with whom they pretended to be in friendship, as well as Spaniards and Portuguese, with whom they were at war.

The Algerines were now become very formidable to the European powers. The Spaniards, who were most in danger, and least able to cope with them, solicited the assistance of England, the pope, and other states. The French, however, were the first who dared to show their resentment of the perfidious behaviour of these miscreants; and in 1617, M. Beaulieu was sent against them with a fleet of 50 men of war, who defeated their fleet, took two of their vessels, while their admiral sunk his own ship and crew, rather than fall into his enemies hands.

In 1620, a squadron of English men of war was sent against Algiers, under the conduct of Sir Robert Mansel

³⁴ Algiers. An English squadron sent against the Algerines. Manfel: but of this expedition we have no other account, than that it returned without doing any thing; and the Algerines, becoming more and more insolent, openly defied all the European powers, the Dutch only excepted; to whom, in 1625, they sent a proposal, directed to the prince of Orange, that in case they would fit out 20 sail of ships the following year, upon any good service against the Spaniards, they would join them with 60 sail of their own.

The next year, the *Coulolies*, or *Cologlies* (the children of such Turks as had been permitted to marry at Algiers), who were enrolled in the militia, having seized on the citadel, had well nigh made themselves masters of the city; but were attacked by the Turks and renégadoes, who defeated them with terrible slaughter. Many scores of them were executed; and their heads thrown in heaps upon the city-walls, without the eastern gate. Part of the citadel was blown up; and the remaining *Coulolies* were dismissed from the militia, to which they were not again admitted till long after.

³⁵ States of Barbary throw off their dependence on the Porte.

In 1623, the Algerines and other states of Barbary threw off their dependence on the Porte altogether, and set up for themselves. What gave occasion to this was the 25 years truce which Sultan Amurath IV. was obliged to make with the emperor Ferdinand II. to prevent his being overmatched by carrying on a war against him and the soplis of Persia at the same time. As this put a stop to the piratical trade of the Algerines, they proceeded as above-mentioned; and resolved, that whoever desired to be at peace with them, must, distinctly and separately, apply to their government.—No sooner was this resolution taken, than the Algerines began to make prizes of several merchant ships belonging to powers at peace with the Porte. Nay, having seized a Dutch ship and poleacre at Scanderoon, they ventured on shore; and finding the town abandoned by the Turkish aga and inhabitants, they plundered all the magazines and warehouses, and set them on fire.—About this time Lewis XIII. undertook to build a fort on their coasts, instead of one formerly built by the Marfilians, and which they had demolished. This, after some difficulty, he accomplished; and it was called the *Bastion of France*: but the situation being afterwards found inconvenient, the French purchased the port of La Calle, and obtained liberty to trade with the Arabians and Moors. The Ottoman court, in the mean time, was so much embarrassed with the Persian war, that there was no leisure to check the Algerine piracies. This gave an opportunity to the vizir and other courtiers to compound matters with the Algerines, and to get a share of their prizes, which were very considerable. However, for form's sake, a severe reprimand, accompanied with threats, was sent them; to which they replied, that “these depredations deserved to be indulged to them, seeing they were the only bulwark against the Christian-powers, especially against the Spaniards, the sworn enemies of the Moslem name:” adding, that “if they should pay a punctilious regard to all that could purchase peace, or liberty to trade with the Ottoman empire, they would have nothing to do but set fire to all their shipping, and turn camel-drivers for a livelihood.”

In the year 1635, four younger brothers of a good family in France, entered into an undertaking so desperate, that perhaps the annals of knight-errantry can

scarce furnish its equal.—This was no less than to retort the piracies of the Algerines upon themselves; and as they indiscriminately took the ships of all nations, so were these heroes indiscriminately to take the ships belonging to Algiers; and this with a small frigate of ten guns!—In this ridiculous undertaking, 100 volunteers embarked; a Maltese commission was procured, together with an able master, and 36 mariners.—They had the good fortune, on their first setting out, to take a ship laden with wine, on the Spanish coast: with which they were so much elated, that three days after they madly encountered two large Algerine corsairs, one of 20 and the other of 24 guns, both well manned, and commanded by able officers. These two large vessels having got the small frigate between them, plied her furiously with great shot, which soon took off her main mast: notwithstanding which, the French made so desperate a resistance, that the pirates were not able to take them, till the noise of their fire brought up five more Algerines; when the French vessel, being almost torn to pieces, was boarded and taken. The young knights-errant were punished for their temerity by a dreadful captivity, from which they redeemed themselves in 1642 at the price of 6000 dollars.

The Algerines prosecuted their piracies with impunity, to the terror and disgrace of the Europeans, till the year 1652; when a French fleet being accidentally driven to Algiers, the admiral took it into his head to demand a release of all the captives of his nation, without exception. This being refused, the Frenchman without ceremony carried off the Turkish viceroy, and his *cadi* or judge, who were just arrived from the Porte, with all their equipage and retinue. The Algerines, by way of reprisal, surprised the Bastion of France already mentioned, and carried off the inhabitants to the number of 600, with all their effects; which so provoked the admiral, that he sent them word that he would pay them another visit the next year with his whole fleet.

The Algerines, undismayed by the threats of the French admiral, fitted out a fleet of 16 galleys and galiots, excellently manned and equipped, under the command of Admiral Hali Pinchinin.—The chief design of this armament was against the treasure of Loretto; which, however, they were prevented by contrary winds from obtaining. Upon this they made a descent on Puglia in the kingdom of Naples; where they ravaged the whole territory of Necotra, carrying off a vast number of captives, and among them some nuns. From thence steering towards Dalmatia, they scoured the Adriatic; and loading themselves with immense plunder, left those coasts in the utmost consternation and repentment.

At last the Venetians, alarmed at such terrible depredations, equipped a fleet of 28 sail, under the command of admiral Capello, with express orders to burn, sink, or take, all the Barbary corsairs he met with, either on the open seas, or even in the Grand Signior's harbours, pursuant to a late treaty of peace with the Porte. On the other hand, the captain bashaw, who had been sent out with the Turkish fleet to chase the Florentine and Maltese cruisers out of the Archipelago, understanding that the Algerine squadron was so near, sent express orders to the admiral to come to his assistance. Pinchinin readily agreed; but having first resolved on a descent upon the island of Lissa, or Lisi-

³⁸ The Algerines fit out a formidable fleet.

³⁹ Which is totally destroyed by the Venetians.

Algiers.

na, belonging to the Venetians, he was overtaken by Capello, from whom he retired to Valona, a sea-port belonging to the Grand Signior, whither the Venetian admiral pursued him; but the Turkish governor refusing to eject the pirates according to the articles of the peace between the Ottoman court and Venice, Capello was obliged to content himself with watching them for some time. Pinchinin was soon weary of restraint, and ventured out; when an engagement immediately ensued, in which the Algerines were defeated, and five of their vessels disabled; with the loss of 1500 men, Turks, and Christian slaves; besides 1600 galley-slaves who regained their liberty. Pinchinin, after this defeat, returned to Vallona, where he was again watched by Capello; but the latter had not lain long at his old anchorage before he received a letter from the senate, desiring him to make no farther attempt on the pirates at that time, for fear of a rupture with the Porte. This was followed by a letter from the governor of Valona, desiring him to take care lest he incurred the Sultan's displeasure by such insults. The brave Venetian was forced to comply; but, resolving to take such a leave of the Algerines as he thought they deserved, observed how they had reared their tents, and drawn their booty and equipage along the shore. He then kept firing among their tents, while some well-manned galliots and brigantines were ordered among their shipping, who attacked them with such bravery, that, without any great loss, they towed out their 16 galleys, with all their cannon, stores, &c.—In this last engagement, a ball from one of the Venetian galleys happening to strike a Turkish mosque, the whole action was considered as an insult upon the Grand Signior. To conceal this, Capello was ordered to sink all the Algerine ships he had taken, except the admiral; which was to be conducted to Venice, and laid up as a trophy. Capello came off with a severe reprimand; but the Venetians were obliged to buy, with 500,000 ducats, a peace from the Porte. The Grand Signior offered to repair the loss of the Algerines by building ten galleys for them, upon condition that they should continue in his service till the end of the ensuing summer; but Pinchinin, who knew how little the Algerines chose to lie under obligations to him, civilly declined the offer.

40
Algiers in
the utmost
confusion at
the news.

In the mean time, the news of this defeat and loss filled Algiers with the utmost grief and confusion. The whole city was on the point of a general insurrection, when the bashaw and douwan issued out a proclamation, forbidding, not only complaints and outcries, under the severest penalties; but all persons whatever to *take their thumbs from within their girdles*, while they were deliberating on this important point. In the mean time, they applied to the Porte for an order, that the Venetians settled in the Levant should make up their loss. But with this the Grand Signior refused to comply, and left them to repair their losses, as well as build new ships, in the best manner they could. It was not long, however, before they had the satisfaction to see one of their corsairs land, with a fresh supply of 600 slaves, whom he had brought from the coast of Iceland, whither he had been directed by a miscreant native taken on board a Danish ship.

41
They set out
a new fleet.

Our pirates did not long continue in their weak and defenceless state; being able, at the end of two years, to appear at sea with a fleet of 65 sail. The admiral

Pinchinin equipped four galliots at his own expence; with which, in conjunction with the Chiayah, or secretary of the bashaw of Tripoli, he made a second excursion. This small squadron, consisting of five galleys and two brigantines, fell in with an English ship of 40 guns; which, however, Pinchinin's captains refused to engage; but being afterwards reproached by him for their cowardice, they swore to attack the next Christian ship which came in their way. This happened to be a Dutch merchantman, of 28 guns and 40 men, deeply laden, and unable to use her sails by reason of a calm. Pinchinin immediately summoned her to surrender; but receiving an ironical answer, drew up his squadron in form of an half-moon, that they might pour their shot all at once into their adversary. This, however, the Dutchman avoided, by means of a breeze of wind which fortunately sprung up and enabled him to turn his ship; upon which the galleys ran foul of each other.—Upon this, Pinchinin ran his own galley along side of the merchantman, the upper-deck of which 70 Algerines immediately took possession of, some of them cutting the rigging, and others plying the hatches with hand-grenadoes: but the Dutchmen having secured themselves in their close quarters, began to fire at the Algerines on board, from two pieces of cannon loaded with small shot; by which they were all soon killed, or forced to submit. Pinchinin, in the mean time, made several unsuccessful attempts to relieve his men, as well as to surround the Dutchman with his other galleys: but that ship lay so deep in the water, that every shot did terrible execution among the pirates; so that they were obliged to remove farther off. At last the Dutch captain, having ordered his guns to be loaded with cartouches, gave them such a parting volley as killed 200 of them, and sent the rest back to Algiers in a most dismal plight.

Algiers.

42
Five of their
galleys de-
feated by a
Dutch mer-
chantman.

But though Pinchinin thus returned in disgrace, the rest of the fleet quickly came back with vast numbers of slaves, and an immense quantity of rich spoils; insomuch that the English, French, and Dutch, were obliged to cringe to the mighty Algerines, who sometimes vouchsafed to be at peace with them, but swore eternal war against Spain, Portugal, and Italy, whom they looked upon as the greatest enemies to the Mahometan name. At last Lewis XIV. provoked by the grievous outrages committed by the Algerines on the coasts of Provence and Languedoc, ordered, in 1681, a considerable fleet to be fitted out against them, under the Marquis du Quesne, vice-admiral of France. His first expedition was against a number of Tripolitan corsairs; who had the good fortune to outrow him, and shelter themselves in the island of Scio belonging to the Turks. This did not, however, prevent him from pursuing them thither, and making such terrible fire upon them as quickly destroyed 14 of their vessels, besides battering the walls of the castle.

43
Prepara-
tions against
Algiers by
Lewis XIV.

This severity seemed only to be designed as a check to the piracies of the Algerines; but, finding they still continued their outrages on the French coast, he sailed to Algiers in August 1682, cannonading and bombarding it so furiously, that the whole town was in flames in a very little time. The great mosque was battered down, and most of the houses laid in ruins, insomuch that the inhabitants were on the point of abandoning the place; when on a sudden the wind turned about,

and obliged Du Quesne to return to Toulon. The Algerines immediately made reprisals, by sending a number of galleys and galliots to the coasts of Provence, where they committed the most dreadful ravages, and brought away a vast number of captives: upon which a new armament was ordered to be got ready at Toulon and Marseilles against the next year; and the Algerines, having received timely notice, put themselves into as good a state of defence as the time would allow. In May 1683, Du Quesne with his squadron cast anchor before Algiers; where, being joined by the Marquis D'Affranville, at the head of five stout vessels, it was resolved to bombard the town next day. Accordingly 100 bombs were thrown into it the first day, which did terrible execution; while the besieged made some hundred discharges of their cannon against them, without doing any considerable damage. The following nights the bombs were again thrown into the city in such numbers, that the dey's palace and other great edifices were almost destroyed; some of their batteries were dismounted, and several vessels sunk in the port. The dey and Turkish bashaw, as well as the whole soldiery, alarmed at this dreadful havoc, immediately sued for peace. As a preliminary, the immediate surrender was insisted on of all Christian captives, who had been taken fighting under the French flag; which being granted, 142 of them were immediately delivered up, with a promise of sending him the remainder as soon as they could be got from the different parts of the country. Accordingly Du Quesne sent his commissary-general and one of his engineers into the town; but with express orders to insist upon the delivery of all the French captives without exception, together with the effects they had taken from the French; and that Mezomorto their then admiral, and Hali Rais one of their captains, should be given as hostages.

This last demand having embarrassed the dey, he assembled the douwan, and acquainted them with it: upon which Mezomorto fell into a violent passion, and told the assembly, that the cowardice of those who sat at the helm had occasioned the ruin of Algiers; but that, for his part, he would never consent to deliver up any thing that had been taken from the French. He immediately acquainted the soldiery with what had passed; which so exasperated them, that they murdered the dey that very night, and on the morrow chose Mezomorto in his place. This was no sooner done, than he cancelled all the articles of peace which had been made, and hostilities were renewed with greater fury than ever.

47
 Set on fire
 and almost
 destroyed.

The French admiral now kept pouring in such volleys of bombs, that, in less than three days, the greatest part of the city was reduced to ashes, and the fire burnt with such vehemence, that the sea was enlightened with it for more than two leagues round. Mezomorto, unmoved at all these disasters, and the vast number of the slain, whose blood ran in rivulets along the streets; or rather, grown furious and desperate, sought only how to wreak his revenge on the enemy; and, not content with causing all the French in the city to be cruelly murdered, ordered their consul to be tied hand and foot, and fastened alive to the mouth of a mortar, from whence he was shot away against their navy.— By this piece of inhumanity Du Quesne was so exas-

perated, that he did not leave Algiers till he had utterly destroyed all their fortifications, shipping, almost all the lower part, and above two thirds of the upper part, of the city; by which means it became little else than an heap of ruins.

The haughty Algerines were now thoroughly convinced that they were not invincible; and, therefore, immediately sent an embassy into France, begging in the most abject terms for peace; which Lewis immediately granted, to their inexpressible joy. They now began to pay some regard to other nations, and to be a little cautious how they wantonly incurred their displeasure. The first bombardment by the French had so far humbled the Algerines, that they condescended to enter into a treaty with England; which was renewed, upon terms very advantageous to the latter, in 1686. It is not to be supposed, however, that the natural perfidy of the Algerines would disappear on a sudden: notwithstanding this treaty, therefore, they lost no opportunity of making prizes of the English ships when they could conveniently come at them. Upon some infringement of this kind, Captain Beach drove ashore and burnt seven of their frigates in 1695; which produced a renewal of the treaty five years after: but it was not till the taking of Gibraltar and Port Mahon, that Britain could have a sufficient check upon them to enforce the observation of treaties; and these have since proved such restraints upon Algiers, that they still continue to pay a greater deference to the English than to any European power.

The present century furnishes no very remarkable events with regard to Algiers; except the taking of the famed city of Oran from the Spaniards in 1708 (which however they regained in 1737), and the expulsion of the Turkish bashaw, and uniting his office to that of dey in 1710. This introduced the form of government which still continues in Algiers.

The dey is now absolute monarch; and pays no other revenue to the Porte, than that of a certain number of fine boys or youths, and some other presents which are sent thither yearly. His own income, probably, rises and falls according to the opportunities he hath of fleecing both natives and foreigners; whence it is variously computed by different authors. Dr Shaw computes the taxes of the whole kingdom to bring into the treasury no more than 300,000 dollars; but supposes that the eighth part of the prizes, the effects of those persons who die without children, joined to the yearly contributions raised by the government, presents from foreigners, fines and oppressions, may bring in about as much more. Both the dey, and officers under him, enrich themselves by the same laudable methods of rapine and fraud; which it is no wonder to find the common people practising upon one another, and especially upon strangers, seeing they themselves are impoverished by heavy taxes and the injustice of those who are in authority.

We have already hinted, that the first deys were elected by the militia, who were then called the *douwan*, or common-council. This elective body was at first composed of 800 militia-officers, without whose consent the dey could do nothing; and upon some urgent occasions, all the officers residing in Algiers, amounting to above 1500, were summoned to assist. But since the deys, who may be compared to the Dutch

Algiers.

Stadtholders, have become more powerful, the douwan is principally composed of 30 chiah-bashaws, or colonels, with now and then the musti and cadi upon some emergencies; and, on the election of a dey, the whole soldiery are allowed to come and give their votes. All the regulations of state ought to be determined by that assembly, before they pass into a law, or the dey hath power to put them in execution: but, for many years back, the douwan is of so little account, that it is only convened out of formality, and to give assent to what the dey and his chief favourites have concerted beforehand. The method of gathering the votes in this august assembly is perfectly agreeable to the character of those who compose it. The aga, or general of the janizaries, or the president *pro tempore*, first proposes the question; which is immediately repeated with a loud voice by the chia-bashaws, and from them echoed again by four officers called *basbaldalas*, from these the question is repeated from one member of the douwan to another, with strange contortions, and the most hideous growlings, if it is not to their liking. From the loudness of this growling noise, the aga is left to guess as well as he can whether the majority of the assembly are pleased or displeas'd with the question; and from such a preposterous method, it is not surprising that these assemblies should seldom end without some tumult or disorder. As the whole body of the militia is concerned in the election of a new dey, it is seldom carried on without blows and bloodshed: but when once the choice is made, the person elected is saluted with the words *ALLA BARICK*, "God bless you, and prosper you;" and the new dey usually causes all the officers of the douwan who had oppos'd his election to be strangled, filling up their places with those who had been most zealous in promoting it. From this account of the election of the deys, it cannot be expected that their government should be at all secure; and as they arrive at the throne by tumult, disorder, and bloodshed, they are generally deprived of it by the same means, scarcely one in ten of them having the good fortune to die a natural death.

53
Punishments, &c.

In this country it is not to be expected that justice will be administered with any degree of impartiality. The Mahometan soldiery, in particular, are so much favoured, that they are seldom put to death for any crime, except rebellion; in which case they are either strangled with a bow-string, or hanged to an iron hook. In lesser offences, they are fined, or their pay stopp'd; and if officers, they are reduced to the station of common soldiers, from whence they may gradually raise themselves to their former dignity. Women guilty of adultery, have a halter tied about their necks, with the other end fastened to a pole, by which they are held under water till they are suffocated. The *bastinado* is likewise inflict'd for small offences; and is given either upon the belly, back, or soles of the feet, according to the pleasure of the cadi; who also appoints the number of strokes. These sometimes amount to 200 or 300, according to the indulgence the offender can obtain either by bribery or friends; and hence he often dies under this punishment, for want of powerful enough advocates. But the most terrible punishments are these inflict'd upon the Jews or Christians who speak against Mahomet or his religion; in which case, they must either turn Mahometan, or be impaled alive. If they

afterwards apostatize, they are burned or roasted alive, or else thrown down from the top of the city-walls, upon iron hooks, where they are caught by different parts of their body, according as they happen to fall, and sometimes expire in the greatest torments; though by accident they may be put out of pain at once, as we have already related of the Spanish adventurer John Gascon. This terrible punishment, however, begins now to be difused.

Algiers.

The officer next in power to the dey is the aga of the janizaries, who is one of the oldest officers in the army, and holds his post only for two months. He is then succeeded by the chiah, or next senior officer.—During the two months in which the aga enjoys his dignity, the keys of the metropolis are in his hands; all military orders are issued out in his name; and the sentence of the dey upon any offending soldier, whether capital or not, can only be executed in the court of his palace.—As soon as he is gone through this short office, he is considered as *mazoul*, or superannuated; receives his pay regularly, like the rest of the militia, every two moons; is exempt from all further duties, except when called by the dey to assist at the grand council, to which he hath, however, a right to come at all times, but hath no longer a vote in it.—Next to the aga in dignity, is the secretary of state, who registers all the public acts; and after him are the 30 chiahs, or colonels, who sit next to the aga in the douwan, and in the same gallery with him. Out of this class are generally chosen those who go embassadors to foreign courts, or who disperse the dey's orders throughout the realm.—Next to them are 800 bolluck-bashaws, or eldest captains, who are promoted to that of chiah-bashaws, according to their seniority. The oldack-bashaws, or lieutenants, are next; who amount to 400, and are regularly raised to the rank of captains in their turn, and to other employments in the state, according to their abilities. These, by way of distinction, wear a leather strap, hanging down to the middle of their back. One rule is strictly observed in the rotation of these troops from one deputy to a higher; viz. the right of seniority; one single infringement of which would cause an insurrection, and probably cost the dey his life. Other military officers of note are the vekelards, or purveyors of the army; the peys, who are the four oldest soldiers, and consequently the nearest to preferment; the foulacks, who are the next in seniority to them, and are part of the dey's body-guard, always marching before him when he takes the field, and distinguished by their carbines and gilt scymiters, with a brass gun on their caps; the kayts, or Turkish soldiers, each band of whom have the government of one or more adowars, or itinerant villages, and collect their taxes for the dey; and the sagiards, or Turkish lance-men, 100 of whom always attend the army, and watch over the water appointed for it. To these we may add the beys, or governors of the three great provinces of the realm. All the above-mentioned officers ought to compose the great douwan or council above-mentioned; but only the 30 chiah-bashaws have a right to sit in the gallery next after the dey: The rest are obliged to stand on the floor of the hall, or council-chamber, with their arms across, and, as much as possible, without motion; neither are they permitted to enter with their swords on, for fear of a tumult. As for those who

ficers.

Algiers. who have any matters to transact with the douwan, they must stand without, let the weather be ever so bad; and there they are commonly presented with coffee by some of the inferior officers, till they are dismissed.

⁵⁵
Division of
the king-
dom.

The kingdom of Algiers is at present divided into three provinces or districts, viz. the eastern, western, and southern. The eastern, or Levantine government, which is by far the most considerable of the three, and is also called *Beylick*, contains the towns of Bona, Constantina, Gigeri, Bujeyah, Steffa, Tebef, Zamoura, Biscara, and Necanz, in all which the Turks have their garrisons: besides which, it includes the two ancient kingdoms of Cuco and Labez, though independent of the Algerine government, to whose forces their country is inaccessible; so that they still live under their own cheyks chosen by each of their adowars or hords. To these we may add a French factory at Callo, under the direction of the company of the French Bastion.—The western government hath the towns of Oran, Tremeccen, Mostagan, Tenez, and Secrelly with its castle and garrison.—The southern government hath neither town, village, nor even a house, all the inhabitants living in tents, which obliges the dey and his forces to be always encamped.

⁵⁶
Rivers.

The most considerable rivers of Algiers are the Zha, or Ziz, which runs across the province of Tremeccen, and the desert of Anguid, falling into the Mediterranean near the town of Tabecrita, where it has the name of *Sirut*. (2.) The Haregol, supposed the *Sign* of Ptolemy, comes down from the great Atlas, crosses the desert of Anguid, and falls into the sea, about five leagues from Oran. (3.) The Mina, supposed the *Chylenatis* of Ptolemy, a large river, which runs through the plains of Bathala, and falls into the sea near the town of Arzew. This river hath lately received the name of *Cena*, who rebuilt the town of Bathalah after it had been destroyed. (4.) The Shellif, Zilef, or Zilif, descending from the mount Gnanexeris, runs through some great deserts, the lake Titteri, the frontiers of Tremeccen and Tenez, falling into the sea a little above the city of Mostagan. (5.) The Celef, supposed to be the *Carthena* of the ancients, falls into the sea about three leagues west of Algiers, after a short course of 18 or 20 leagues. (6.) The Hued-alquivir, supposed to be the *Nalabata*, or *Nafaba*, of the ancients, and called by the Europeans *Zinganir*, runs down with a swift course, through some high mountains of Cuco, and falls into the sea near Bujeyah.

⁵⁷
Harbour of
Bujeyah
cleared by
accident.

Whilst the city of Bujeyah was in the hands of the Christians, the mouth of this river was so choaked up with sand, that no vessel could come up into it: but in 1555, very soon after it was taken by the Moors, the great rains swelled it to such a degree, that all the sand and mud was carried off; so that galleys, and other vessels, have ever since entered it with ease, where they lie safe from storms, and all winds, but that which blows from the north. (7.) Suf-Gemar, or Suf-Gimmar al Rumniel, supposed to be the *Ampfaga* of Ptolemy, hath its source on mount Auras, on the confines of Atlas; thence runs through some barren plains, and the fruitful ones of Constantina, where its stream is greatly increased by some other rivers it receives; from thence running northward, along the ridges of some high mountains, it falls into the sea a little east of Gigeri.

(8.) The Ladag, or Ludeg, runs down from mount Atlas through part of Constantina, and falls into the sea a little eastward of Bona. (9.) Guadi, or Guadel Barbar, springs from the head of Orbus, or Urbs, in Tripoli, runs through Bujeyah, and falls into the sea near Tabarea.

Algiers.

Besides these there are many others of less note; of which, however, we do not find that the Algerines avail themselves as they might do, their genius leading them too much to the piratical trade to mind any real advantage that might be derived from their own country. The corsairs, or pirates, form each a small republic, of which the rais or captain is the supreme bashaw; who, with the officers under him, form a kind of douwan, in which every matter relating to the vessel is decided in an arbitrary way. These corsairs are chiefly instrumental in importing whatever commodities are brought into the kingdom either by way of merchandise or prizes. These consist chiefly of gold and silver stuffs, damasks, cloths, spices, tin, iron, plated brass, lead, quicksilver, cordage, sail-cloth, bullets, cochineal, linen, tartar, alum, rice, sugar, soap, cotton raw and spun, copperas, aloes, brazil and logwood, vermilion, &c. Very few commodities, however, are exported from this part of the world: the oil, wax, hides, pulse, and corn produced, being but barely sufficient to supply the country; though, before the loss of Oran, the merchants have been known to ship off from one or other of the ports of Barbary several thousand tons of corn. The consumption of oil, though here in great abundance, is likewise so considerable in this kingdom, that it is seldom permitted to be shipped off for Europe. The other exports consist chiefly in ostriches feathers, copper, ruggs, silk fashes, embroidered handkerchiefs, dates, and Christian slaves. Some manufactures in silk, cotton, wool, leather, &c. are carried on in this country, but mostly by the Spaniards settled here, especially about the metropolis. Carpets are also a manufacture of the country, which, though much inferior to those of Turkey, both in beauty and fineness, are preferred by the people to lie upon, on account of their being both cheaper and softer. There are also, at Algiers, looms for velvet, taffaties, and other wrought silks; and a coarse sort of linen is likewise made in most parts of the kingdom. The country furnishes no materials for ship-building. They have neither ropes, tar, sails, anchors, nor even iron. When they can procure enough of new wood to form the main timbers of a ship, they supply the rest from the materials of prizes which they have made; and thus find the secret of producing new and swift sailing vessels from the ruins of the old. Of all the states on the coast of Barbary, the Algerines are the strongest at sea.

⁵⁸
Account of
the corsairs,
commerce,
&c.

The inhabitants along the sea-coasts are a mixture of different nations; but chiefly Moors and Morecos driven out of Catalonia, Arragon, and other parts of Spain. Here are also great numbers of Turks, who come from the Levant to seek their fortune; as well as multitudes of Jews and Christians taken at sea, who are brought hither to be sold for slaves. The Berbers are some of the most ancient inhabitants of the country; and are supposed to be descended from the ancient Sabeans, who came hither from Arabia Felix, under the conduct of one of their princes. Others believe:

⁵⁸

Inhabitants.

lieve:

Alg'ers.

lieve them to be some of the Canaanites driven out of Palestine by Joshua. These are dispersed all over Barbary, and divided into a multitude of tribes under their respective chiefs: most of them inhabit the mountainous parts; some range from place to place, and live in tents, or portable huts; others in scattered villages: they have, nevertheless, kept themselves for the most part from intermixing with other nations. The Berebers are reckoned the richest of all, go better clothed, and carry on a much larger traffic of cattle, hides, wax, honey, iron, and other commodities. They have also some artificers in iron, and some manufacturers in the weaving branch.—The name of *Bereber* is supposed to have been originally given them on account of their being first settled in some desert place. Upon their increasing in process of time, they divided themselves into five tribes, probably on account of religious differences, called the *Zinhagians*, *Musamedins*, *Zeneti*, *Hoares*, and *Gomeses*; and these having produced 600 families, subdivided themselves into a great number of petty tribes.—To these we may add the *Zwoowabs*, by European authors called *Azuagues*, or *Affagues*, who are likewise dispersed over most parts of Barbary and Numidia. Great numbers of these inhabit the mountainous parts of Cuco, Labez, &c. leading a wandering pastoral life.—But the most numerous inhabitants are the Moors and Arabians. The former are very stout and warlike, and skilful horsemen; but so addicted to robbing, that one cannot safely travel along the country at a distance from the towns without a guard, or at least a marabout or saint for a safeguard. For as they look upon themselves to be the original proprietors of the country, and not only as dispossessed by the rest of the inhabitants, but reduced by them to the lowest state of poverty, they make no scruple to plunder all they meet by way of reprisal. The inhabitants, in general, have a pretty fair complexion; they are robust and well proportioned. People of distinction wear their beard; they have rich clothes made of silk, embroidered with flowers of gold, and turbans enriched with jewels. The Turks, who compose the military force, have great privileges, pay no taxes, are never publicly punished, and rarely in private. The lowest soldier domineers over the most distinguished Moors at pleasure. If he finds them better mounted than himself, he exchanges horses without ceremony. The Turks alone have the privilege of carrying fire-arms. Many good qualities, however, distinguish them in spite of this excess of despotism. They never game for money, not even for trifles; and they never profane the name of the Deity. They soon forget their private quarrels; and after the first paroxysm of resentment is over, it is infamy for a Turk to keep in remembrance the injuries he has received. In this respect certainly they are less barbarous than other nations that boast of their civilization. See MOORS.

ALGIERS, a city, the capital of the above kingdom, is probably the ancient *Icosium*: by the Arabians called *Algezair*, or rather *Al-Jezier*, or *Al-Jezerah*, i. e. *the island*, because there was an island before the city, to which it hath been since joined by a mole. It is built on the declivity of a hill by the sea-side, in the form of an amphitheatre: at sea, it looks like the top-sail of a ship. The tops of the houses are quite flat and white; inasmuch, that when it is first discovered, and

would take it to be a place where they bleach linen. One house rises above another in such a manner that they do not hinder each other's prospect. The streets are so narrow, that they will scarce admit two persons to walk a-breast, and the middle part is lower than the sides. When any loaded beasts, such as camels, horses, mules, or asses, pass along, you are forced to stand up close to the wall to let them pass by. There is but one broad street, which runs through the city from east to west, in which are the shops of the principal merchants, and the market for corn and other commodities. The lower part of the walls of the city are of hewn stone, and the upper part of brick; they are 30 feet high on the land side, and 40 towards the sea; the fosses or ditches are twenty feet broad, and seven deep. There is no sweet water in the city; and tho' there is a tank or cistern in every house, yet they often want water, because it rains but seldom: the chief supply is from a spring on a hill, the water of which is conveyed by pipes to above a hundred fountains, at which a bowl is fastened for the use of passengers. The common reservoir is at the end of the mole, where the ships take in their water. Every one takes his turn at these places, except the Turks, who are first, and the Jews last. There are five gates, which are open from sunrise till sun-setting; and seven forts, or castles, without the walls, the greatest of which is on the mole without the gate, all of which are well supplied with great guns. There are ten large mosques, and fifty small ones; three great colleges or public schools, and a great number of petty ones for children. The houses are square, and built of stone and brick, with a square court in the middle, and galleries all round. There are said to be about 100,000 inhabitants in the city, comprehending 5000 Jewish families, besides Christians. There are four fundics, or public inns, such as are in Turkey; and six cazernes, or barracks, for the unmarried Turkish soldiers, which will hold 600 each. There are no inns for Christians to lodge at; but only a few tippling huts kept by slaves, for the accommodation of Greeks and the poorer sort of travellers, where any thing may be had for money. Here are bagnios, or public baths, in the same manner as in Turkey, at a very moderate rate. The women have baths of their own, where the men dare not come. Without the city there are a great number of sepulchres, as also cells or chapels, dedicated to marabouts, or reputed saints, which the women go to visit every Friday. The Turkish soldiers are great tyrants; for they not only turn others out of the way in the streets, but will go to the farm-houses in the country for twenty days together, living on free quarters, and making use of every thing, not excepting the women. The Algerines eat, as in Turkey, sitting cross-legged round a table about four inches high, and use neither knives nor forks; before they begin, every one says *Be isme Allah*, "In the name of God." When they have done, a slave pours water on all their hands as they sit, and then they wash their mouths. Their drink is water, sherbet, and coffee. Wine is not allowed, though drank immoderately by some. The prospect of the country and sea from Algiers is very beautiful, being built on the declivity of a mountain; but the city, though for several ages it has braved some of the greatest powers in Christendom, it is said, could make but a faint defence against a regular siege; and that

Algiers.

Algol,
Algonquins

that three English fifty-gun ships might batter it about the ears of its inhabitants from the harbour. If so, the Spaniards must have been very deficient either in courage or conduct. They attacked it in the year 1775, by land and by sea, but were repulsed with great loss; though they had near 20,000 foot and 2000 horse, and 47 king's ships of different rates and 346 transports. In the year 1783 and 1784, they also renewed their attacks by sea to destroy the city and galleys; but, after spending a quantity of ammunition, bombs, &c. were forced to retire without either its capture or extinction. The mole of the harbour is 500 paces in length, extending from the continent to a small island where there is a castle and large battery. E. Long. 3. 30. N. Lat. 36. 40.

ALGOL, a fixed star of the third magnitude, called *Medusa's Head*, in the constellation Perseus; its longitude is $21^{\circ} 50' 42''$ of Taurus, and its latitude $23^{\circ} 23' 47''$ north; according to Flamsteed's catalogue. For an account of its changes, period, and other circumstances, see ASTRONOMY (*Index*).

ALGONQUINS, a nation in North America, who formerly possessed great tracts of land along the north shore of the river St Lawrence. For a long time they had no rivals as hunters and warriors, and were long in alliance with the Iroquois; whom they agreed to protect from all invaders, and to let them have a share of their venison. The Iroquois, on the other hand, were to pay a tribute to their allies, out of the culture of the earth; and to perform for them all the menial duties, such as slaying the game, curing the flesh, and dressing the skins. By degrees, however, the Iroquois associated in the hunting matches and warlike expeditions of the Algonquins; so that they soon began to fancy themselves as well qualified, either for war or hunting, as their neighbours. One winter, a large detachment of both nations having gone out a-hunting, and secured, as they thought, a vast quantity of game, six young Algonquins and as many Iroquois were sent out to begin the slaughter. The Algonquins, probably become a little jealous of their associates, upon seeing a few elks, desired the Iroquois to return, on pretence that they would have sufficient employment in slaying the game they should kill; but after three days hunting, having killed none, the Iroquois exulted, and in a day or two privately set out to hunt for themselves. The Algonquins were so exasperated at seeing their rivals return laden with game, that they murdered all the hunters in the night-time. The Iroquois dissembled their resentment; but in order to be revenged, applied themselves to study the art of war as practised among those savage nations. Being afraid of engaging with the Algonquins at first, they tried their prowess on other inferior nations, and, when they thought themselves sufficiently expert, attacked the Algonquins with such diabolical fury, as showed they could be satisfied with nothing less than the extermination of the whole race; which, had it not been for the interposition of the French, they would have accomplished.—The few Algonquin nations that are now to be seen, seem entirely ignorant of agriculture, and subsist by fishing and hunting. They allow themselves a plurality of wives; notwithstanding which, they daily decrease in populousness, few or none of their nations containing above 6000 souls, and many of them not 2000. Their language is

one of the three radical ones in North America, being understood from the river St Lawrence to the Mississippi.

ALGOR, with physicians, an unusual coldness in any part of the body.

ALGORITHM, an Arabic word expressive of numerical computation.

ALGUAZIL, in the Spanish polity, an officer whose business it is to see the decrees of a judge executed.

ALHAGI, in botany, the trivial name of a species of hedyfarum. See HEDYSARUM.

ALHAMA, a very pleasant town of the kingdom of Granada, in Spain, situated in the midst of some craggy mountains, about 25 miles S. W. of Granada, on the banks of the Rio Frio, in W. Long. 1. 10. N. Lat. 36. 59. and having the finest warm baths in all Spain. It was taken from the Moors in 1481. The inhabitants, though surpris'd, and the town without a garrison, made a gallant defence: but being at length forced to submit, the place was abandoned to the pillage of the Christian soldiers; who, not satisfied with an immense quantity of gold and jewels, made slaves of upwards of 3000 of the inhabitants.

ALHAMBRA, the ancient fortrefs and residence of the Moorish monarchs of Granada. It derives its name from the red colour of the materials which it was originally built with, Alhambra signifying a red house. It appears to a traveller a huge heap of as ugly buildings as can well be seen, all huddled together, seemingly without the least intention of forming one habitation out of them. The walls are entirely unornamented, all gravel and pebbles, daubed over with plaster by a very coarse hand: yet this is the palace of the Moorish kings of Granada, indisputably the most curious place within that exists in Spain, perhaps in the world. In many countries may be seen excellent modern as well as ancient architecture, both entire and in ruins; but nothing to be met with any where else can convey an idea of this edifice, except the decorations of an opera, or the tales of the genii.

Passing round the corner of the emperor's palace; one is admitted at a plain unornamented door in a corner. On my first visit, says Mr Swinburne, I confess I was struck with amazement, as I stepped over the threshold, to find myself on a sudden transported into a species of fairy land. The first place you come to is the court called the *communa* or *del mesucar*, that is the *common baths*; an oblong square, with a deep basin of clear water in the middle; two flights of marble steps leading down to the bottom; on each side a parterre of flowers, and a row of orange-trees. Round the court runs a peristyle paved with marble; the arches bear upon very slight pillars, in proportions and style different from all the regular orders of architecture. The ceilings and walls are incrustated with fret-work in stucco, so minute and intricate, that the most patient draughtsman would find it difficult to follow it, unless he made himself master of the general plan. This would facilitate the operation exceedingly; for all this work is frequently and regularly repeated at certain distances, and has been executed by means of square moulds applied successively, and the parts joined together with the utmost nicety. In every division are Arabic sentences of different lengths, most

Spain.

of

Alhambra. of them expressive of the following meanings: "There is no conqueror but God;" or, "Obedience and honour to our Lord Abouabdoula." The ceilings are gilt or painted, and time has caused no diminution in the freshness of their colours, though constantly exposed to the air. The lower part of the walls is mosaic, disposed in fantastic knots and festoons. A work so novel, so exquisitely finished, and so different from all that he had ever seen, must afford a stranger the most agreeable sensations while he treads this magic ground. The porches at the ends are more like grotto-work than any thing else to which they can be compared. That on the right hand opens into an octagon vault, under the emperor's palace, and forms a perfect whispering gallery, meant to be a communication between the offices of both houses.

Opposite to the door of the communa through which you enter, is another leading into the *quarto de los leones*, or apartment of the lions; which is an oblong court, 100 feet in length and 50 in breadth, surrounded with a colonnade 7 feet broad on the sides and 10 at the end. Two porticos or cabinets about 15 feet square, project into the court at the two extremities. The square is paved with coloured tiles; the colonnade with white marble. The walls are covered five feet up from the ground with blue and yellow tiles, disposed chequerwise. Above and below is a border of small escutcheons, enamelled blue and gold, with an Arabic motto on a bend; signifying, "No conqueror but God." The columns that support the roof and gallery are of white marble, very slender, and fantastically adorned. They are 9 feet high, including base and capital, and 8½ inches diameter. They are very irregularly placed; sometimes singly, at others in groups of three, but more frequently two together. The width of the horse-shoe arches above them is four feet two inches for the large ones, and three for the smaller. The ceiling of the portico is finished in a much finer and more complicated manner than that of the communa, and the stucco laid on the walls with inimitable delicacy; in the ceiling it is so artfully frosted and handled as to exceed belief. The capitals are of various designs, though each design is repeated several times in the circumference of the court, but not the least attention has been paid to placing them regularly or opposite to each other. Not the smallest representation of animal life can be discovered amidst the varieties of foliage, grotesques, and strange ornaments. About each arch is a large square of arabesques, surrounded with a rim of characters, that are generally quotations from the Koran. Over the pillars is another square of delightful filligree work. Higher up is a wooden rim, or kind of cornice, as much enriched with carving as the stucco that covers the part underneath. Over this projects a roof of red tiles, the only thing that disfigures this beautiful square. This ugly covering is modern, put on by order of Mr Wall, the late prime minister, who a few years ago gave the Alhambra a thorough repair. In Moorish times, the building was covered with large painted and glazed tiles, of which some few are still to be seen. In the centre of the court are twelve ill-made lions muzzled, their fore parts smooth; their hind parts rough, which bear upon their backs an enormous basin, out of which a lesser rises. While the pipes were kept in good or-

der, a great volume of water was thrown up, that, falling down into the basins, passed through the basins, and issued out of their mouths into a large reservoir, where it communicated by channels with the jet d'eau in the apartments. This fountain is of white marble, embellished with many festoons and Arabic distichs, thus translated:

"See'st thou not how the water flows copiously like the Nile?"

"This resembles a sea washing over its shores, threatening shipwreck to the mariner."

"This water runs abundantly, to give drink to the lions."

"Terrible as the lion is our king in the day of battle."

"The Nile gives glory to the king, and the lofty mountains proclaim it."

"This garden is fertile in delights: God takes care that no noxious animal shall approach it."

"The fair princess that walks in this garden, covered with pearls, augments its beauty so much, that thou may'st doubt whether it be a fountain that flows, or the tears of her admirers."

Passing along the colonnade, and keeping on the fourth side, you come to a circular room used by the men as a place for drinking coffee and forbets in. A fountain in the middle refreshed the apartment in summer. The form of this hall, the elegance of its cupola, the cheerful distribution of light from above, and the exquisite manner in which the stucco is designed, painted, and finished, exceed all powers of description. Every thing in it inspires the most pleasing, voluptuous ideas; yet in this sweet retreat they pretend that Abouabdoulah assembled the Abencerrages, and caused their heads to be struck off into the fountain. Continuing your walk round, you are next brought to a couple of rooms at the head of the court, which are supposed to have been tribunals, or audience-chambers.

Opposite to the *Sala de los Abencerrages* is the entrance into the *Torre de las dos hermanas*, or the tower of the two sisters; so named from two very beautiful pieces of marble laid as flags in the pavement. This gate exceeds all the rest in profusion of ornaments, and in beauty of prospect which it affords through a range of apartments, where a multitude of arches terminate in a large window open to the country. In a gleam of sunshine, the variety of tints and lights thrown upon this ensilade are uncommonly rich. The first hall is the concert-room, where the women sat; the musicians played above in four balconies. In the middle is a jet d'eau. The marble pavement is equal to the finest existing, for the size of the flags and evenness of the colour. The two sisters, which give name to the room, are slabs that measure 15 feet by 7½, without flaw or stain. The walls, up to a certain height, are mosaic, and above are divided into very neat compartments of stucco, all of one design, which is also followed in many of the adjacent halls and galleries. The ceiling is a fretted cove. To preserve this vaulted roof, as well as some of the other principal cupolas, the outward walls of the towers are raised 10 feet above the top of the dome, and support another roof over all, by which means no damage can ever be caused by wet weather or excessive heat and cold. From this hall you pass round the little myrtle-garden

Alhambra. of Lindaraxa, into an additional building made to the east end by Charles V. The rooms are small and low. His dear motto, *Plus outrè*, appears on every beam. This leads to a little tower, projecting from the line of the north wall, called *El tocador*, or the dressing-room of the sultana. It is a small square cabinet, in the middle of an open gallery, from which it receives light by a door and three windows. The look-out is charming. In one corner is a large marble flag, drilled full of holes, through which the smoke of perfumes ascended from furnaces below; and here, it is perfumed, the Moorish queen was wont to sit to fumigate and sweeten her person. The emperor caused this pretty room to be painted with representations of his wars, and a great variety of grotesques, which appear to be copies, or at least imitations, of those in the loggie of the Vatican. From hence you go through a long passage to the hall of ambassadors, which is magnificently decorated with innumerable varieties of mosaics, and the mottos of all the kings of Granada. This long narrow antichamber opens into the communa on the left hand, and on the right into the great audience-hall in the tower of Comares; a noble apartment, 36 feet square, 36 high up to the cornice, and 18 from thence to the centre of the cupola. The walls on three sides are 15 feet thick, on the other 9; the lower range of windows 13 feet high. The whole wall is inlaid with mosaic of many colours, disposed in intricate knots, stars, and other figures. In every part various Arabic sentences are repeated.

Having thus completed the tower of the upper apartments, which are upon a level with the offices of the new palace, you descend to the lower floor, which consisted of bedchambers and summer-rooms: the backstairs and passages, that facilitated the intercourse between them, are without number. The most remarkable room below is the king's bedchamber, which communicated, by means of a gallery, with the upper story. The beds were placed in two alcoves, upon a raised pavement of blue and white tiles; but as it was repaired by Philip V. who passed some time here, it cannot be said how it may have been in former times. A fountain played in the middle, to refresh the apartment in hot weather. Behind the alcoves are small doors, that conduct you to the royal baths. These consist of one small closet with marble cisterns for washing children, two rooms for grown up persons, and vaults for boilers and furnaces that supplied the baths with water and the stoves with vapours. The troughs are formed of large slabs of white marble; the wall are beautified with party-coloured earthen ware; light is admitted by holes in the coved ceiling.

Hard by is a whispering gallery, and a kind of labyrinth, said to have been made for the diversion of the women and children. One of the passages of communication is fenced off with a strong iron grate, and called *the prison of the sultana*; but it seems more probable that it was put up to prevent any body from climbing up into the womens quarter.

Under the council-room is a long slip, called *the king's study*; and adjoining to it are several vaults, said to be the place of burial of the royal family. In the year 1574, four sepulchres were opened; but as they contained nothing but bones and ashes, were immediately closed again.

VOL. I. Part II.

This description of the Alhambra may be finished by observing how admirably every thing was planned and calculated for rendering this palace the most voluptuous of all retirements; what plentiful supplies of water were brought to refresh it in the hot months of summer; what a free circulation of air was contrived, by the judicious disposition of doors and windows; what shady gardens of aromatic trees; what noble views over the beautiful hills and fertile plains! No wonder the Moors regretted Granada; no wonder they still offer up prayers to God every Friday for the recovery of this city, which they esteem a terrestrial paradise. See GRANADA.

ALI, gives the denomination to a sect, or division, among the Mahometans, who adhere to the right of succession of Ali the fourth caliph or successor of Mahomet, and to the reform of Mussulmanism introduced by him. The sectaries of Ali are more particularly called *Schiites*; and stand opposed to the *Sunnites*, or sect of Omar, who adhere to the law as left by Mahomet, Abubeker, and Omar. Ali was cousin of Mahomet, and son-in-law of that prophet, having married his daughter Fatimah. After Mahomet's death, great disputes arose about the succession. Many stood for Ali; but Abubeker was preferred, and elected the first kalif. Ali took his turn, after the death of Othman.—The Persians are the chief adherents to the sect of Ali, whom they hold to have been the legitimate successor of Mahomet, and Abubeker an usurper. On the contrary, the Turks are of the sect of Omar; and hold Ali in execration, having raised a furious civil war among the Mussulmans. The distinguishing badge of the followers of Ali is a red turban, which is worn by the Persians, who are hence called in derision, by the Turks, *Kisilbachi*, q. d. *red-heads*. Ali is reputed the author of several works, particularly a Centiloquium, in great esteem among the Arabs and Persians, part of which has been published in English by Mr Ockley.

ALJAMEIA is a name which the Moriscoes in Spain give to the language of the Spaniards. Among other articles agreed on by the junto, which was appointed by the emperor Charles V. in 1526, in favour of the Moriscoes, this was one, That the Moriscoes should no longer speak Algavareia, i. e. Moorish or Arabic; but should all speak *Aljameia*, i. e. Spanish, as it was called by the Moors, and all their writings and contracts should be in that language.

ALIAS, in law, a second or farther writ issued from the courts of Westminster, after a *capias*, &c. sued out without effect.

ALIBI, in law, denotes the absence of the accused from the place where he is charged with having committed a crime; or his being *elsewhere*, as the word imports, at the time specified.

ALICANT, a large sea-port town in the province of Valencia and territory of Segura. It is seated between the mountains and the sea, and has a castle deemed impregnable. The port is defended by three bastions furnished with artillery. To prevent the visits of the Algerine pirates, watch-towers were built to give notice of the approach of an enemy's ship. It was taken from the Moors in 1264. The castle was taken by the English in 1706, and held out a siege of two years before it was retaken by the French and Spaniards, and at last surrendered upon honourable terms,

Alien.

after part of the rock was blown up on which the castle stood, and the governor killed. The houses are high, and well built; and a very great trade is carried on here, particularly in wine and fruit. It is seated in the Mediterranean, on a bay of the same name, 37 miles north-east of Murcia, and 75 south of Valencia. W. Long. o. 36. N. Lat. 38. 24.

ALICATA, a mountain of Sicily, near the valleys Mazara and Noto, upon which was situated (as is generally thought) the famous Dædalion, where the tyrant Phalaris kept his brazen bull.

ALICATA, a town of Sicily, remarkable for corn and good wine. It was plundered by the Turks in 1543; and is seated on a sort of peninsula near the sea, twenty-two miles S. E. of Girgenti. E. Long. 15. 20. N. Lat. 37. 11.

ALICATA *Chlamys*, was a sort of vest with sleeves, worn by the Roman boys till the age of thirteen, at which time they put on the *prætecta*.

ALIEN, in law, implies a person born in a strange country not within the king's allegiance; in contradistinction to a denizen, or natural subject. The word is formed from the Latin *alius*, "another"; *q. d.* one born in another country. An alien is incapable of inheriting lands in Britain till naturalized by an act of parliament. No alien is intitled to vote at the election of members of parliament; nor can he enjoy any office, or be returned on any jury, unless where an alien is party in a cause, when the inquest is composed of an equal number of denizens and aliens. The reasons for establishing these laws were, that every man is presumed to bear faith and love to that prince and country where he received protection during his infancy; and that one prince might not settle spies in another's country; but chiefly, that the rents and revenues of the country might not be drawn to the subjects of another. Some have thought that the laws against aliens were introduced in the time of Henry II. when a law was made at the parliament of Wallingford, for the expulsion of strangers, in order to drive away the Flemings and Picards introduced into the kingdom by the wars of King Stephen. Others have thought that the origin of this law was more ancient; and that it is an original branch of the feudal law: for by that law no man can purchase any lands but he must be obliged to do fealty to the lords of whom the lands are holden; so that an alien who owed a previous faith to another prince, could not take an oath of fidelity in another sovereign's dominions. Among the Romans, only the *Cives Romani* were esteemed freemen; but when their territories increased, all the Italians were made free, under the name of *Latins*, tho' they had not the privilege of wearing gold rings till the time of Justinian. Afterwards all born within the pale of the empire were considered as citizens.

ALIEN-Duty, an impost laid on all goods imported by aliens, over and above the customs paid for such goods imported by British, and on British bottoms.

ALIENS-Duty is otherwise called *petty customs*, and *navigation-duty*.—Fish dried or salted, and cod-fish or herring not caught in British vessels and cured by British, pay a double *aliens-duty*.—On what footing aliens are permitted to import foreign commodities into Great Britain, see DUTY.

ALIEN-Priories, a kind of inferior monasteries, for-

merly very numerous in England, and so called from their belonging to foreign abbeyes.

ALIENATION, in law, denotes the act of making over a man's property in land, tenements, &c. to another person.

ALIENATION in mortmain, is making over lands, tenements, &c. to a body-politic, or to a religious house, for which the king's licence must first be obtained, otherwise the lands, &c. alienated will be forfeited.

ALIENATION *in fee*, is the selling the fee-simple of any land, or other incorporeal right. All persons who have a right to lands may generally alien them to others; but some alienations are prohibited: such as alienations by tenants for life, &c. whereby they incur a forfeiture of their estate. By the statute of Edward I. a bar was put to alienations by what we call *entails*, which is an expedient for procuring perpetuities in families; but counter expedients were devised to defeat this intent, and a practice was introduced of cutting off entails by fines, and of barring remainders and reversions by recoveries. The statute for alienations in Henry VII.'s time had a great effect on the constitution of this kingdom; as, among other regulations of that reign, it tended to throw the balance of power more into the hands of the people. By the stat. 12 Car. II. cap. 24. fines for alienations are taken away. Crown lands are only alienable under a faculty of perpetual redemption. The council of Lateran, held in 1123, forbids any clerk to alienate his benefice, prebend, or the like. By the laws of the ancient Jews, lands could only be alienated for the space of 50 years. At each return of the jubilee all returned again to the primitive owners, or their descendants, to whom the lands were originally allotted at the first distribution of Canaan.

ALIENATION-Office, is an office to which all writs of covenant and entry, upon which fines are levied, and recoveries suffered, are carried, to have fines for alienation set and paid thereon.

ALIMENT, (from *alo* to nourish), implies food both solid and liquid: from which, by the process of digestion, is prepared a very mild, sweet, and whitish liquor, resembling milk, and distinguished by the name of *chyle*; which being absorbed by the lacteal veins, by them conveyed into the circulation, and there assimilated into the nature of blood, affords that supply of nutrition which the continual waste of the body is found to require.—Next to air, food is the most necessary thing for the preservation of our bodies: and as on the choice thereof our health greatly depends, it is of great importance to understand, in general, what is the properest for our nourishment; and, in particular deviations from health, what is the best adapted to restore us. Our blood and juices naturally incline to become putrid and acrimonious: fresh chyle, duly received, prevents this destructive tendency, and preserves in them that mild state which alone consists with health. An animal diet affords the most of this bland nutritious mucilage; watery fluids dilute the too gross parts, and carry off what is become unfit for use. It is only the small portion of jelly which is separated from the farinaceous parts of vegetables, that, after being much elaborated, is converted into the animal nature; yet the use of vegetables prevents both repletion and a too great tendency to a putrescent acrimony of the blood.

Alienation,
Aliment.

Aliment. blood. In hot climates, as well as against the constitutional heat of particular persons, vegetables are demanded in the largest portion; animal substances afford the highest relish while our appetite continues; but will sate the appetite before the stomach is duly filled. Vegetables may be eaten after either flesh or fish: few herbs or fruits satiate so much as that the stomach may not be filled with them, when it is already satisfied with flesh or fish; whence it may be observed, that no diet which is very nourishing can be eat to fulness, because its nutritious parts are oily and satiating.—Health depends almost wholly on a proper crasis of the blood; and to preserve this a mixture of vegetables in some degree is always required, for a loathing is soon the consequence of animal food alone: hot acrid habits, too, receive from milk and vegetables the needful for correcting their excesses; but in cold, pituitous, and nervous habits, who want most nourishment from least digestion, and from the smallest quantity of food, animal diet is to be used more freely.

Thus much being offered as general principles with respect to the matter and quality of our aliment, the valetudinarian may easily regulate his diet with some advantage to himself by an attention to the few ensuing particulars. In winter, eat freely, but drink sparingly: roast meat is to be preferred, and what is drank should be stronger than at other seasons. In summer, let thirst determine the quantity to be drunk; cold stomachs never require much: boiled meats and vegetables, if not otherwise contradicted, may now be more freely used. Lax habits require the winter's diet to be continued all the year, and rigid ones should be confined to that of summer. Fat people should fast at times, but the lean should never do so. Those who are troubled with eructations occasioned by their food, should drink but little, and use some unaccustomed exercise. The thirsty should drink freely, but eat sparingly. In general, let moderation be observed; and tho' no dinner hath been had, a light supper is at all times to be preferred. After very high-seasoned meats, a glass of water acidulated with the acid elixir of vitriol, or in very weak stomachs the sweet elixir of vitriol, is far more assiduous to the work of digestion than the common method of taking brandy. See further **FOOD** and **DRINK**.

Obligation of ALIMENT, in Scots law, the natural obligation on parents to provide their children with the necessaries of life, &c. See **LAW**, Part III. N° clxxiii. 4.

ALIMENTARIJ Pueri, &c. were certain children maintained and educated by the munificence of the emperors, in a sort of public places, not unlike our hospitals.—Trajan was the first that brought up any of these *alimentary* boys. He was imitated by Adrian. Antoninus Pius did the same for a number of maids, at the solicitation of Faustina; and hence, in some medals of that empress, we read **PUELLAE FAUSTINIANAE**.—Alexander Severus did the like at the request of Mammæa; and the maids thus educated were called **Mammæanæ**.

ALIMENTARY Duct or Canal, is a name given by Dr Tyson and some others to that part of the body thro' which the food passes, from its reception into the mouth to its exit at the *anus*; including the *gula*, stomach, and intestines. See **ANATOMY**.

This duct has been said to be the true characteristic

of an animal, or (in the jargon of the schools) *in proprium quarto modo*; there being no animal without it, and whatever has it being properly enough ranged under the class of animals. Plants receive their nourishment by the numerous fibres of their roots, but have no common receptacle for digesting the food received, or for carrying off the recrements. But in all, even the lowest degree of animal life, we may observe a stomach and intestines, even where we cannot perceive the least formation of any organ of the senses, unless that common one of feeling as in oysters. *Phil. Transf. N° 269, p. 776, seq.*

Dr Wallis brings an argument from the structure of the alimentary tube in man, to prove that he is not naturally carnivorous; to which Dr Tyson makes some objections. *V. Phil. Transf. N° 269, p. 777.*

ALIMENTARY Law, *lex alimentaria*, was an old law among the Romans, whereby children were obliged to find sustenance for their parents.

ALIMONY, in law, implies that allowance which a married woman sues for, and is intitled to, upon any occasional separation from her husband. See **LAW**, Part III. N° clx. 13.

ALIPILARIUS, or **ALIPILUS**, in Roman antiquity, a servant belonging to the baths, whose business it was, by means of waxen plasters, and an instrument called *volfella*, to take off the hairs from the arm-pits, and even arms, legs, &c. this being deemed a point of cleanliness.

ALIPTERIUM, *αλειπτήριον*, in antiquity, a place in the ancient *palestræ*, where the *athleta* were anointed before their exercises.

ALIQUNT PART, in arithmetic, is that number which cannot measure any other exactly without some remainder. Thus 7 is an aliquant part of 16; for twice 7 wants two of 16, and three times 7 exceeds 16 by 5.

ALIQUNT PART, is that part of a number or quantity which will exactly measure it without any remainder. Thus 2 is an aliquot part of 4; 3 of 9; 4 of 16, &c.

ALISANDERS, or **ALEXANDERS**, in botany. See **SMYRNIUM**.

ALISMA, or **WATER-PLANTAIN**: A genus of the polygynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, *Tetrapetaloidæ*. The characters are: The *calyx* is a three-leaved perianthium: The *corolla* consists of three roundish, large, flat, expanding petals: The *stamina* consist of six subulated filaments shorter than the corolla; the antheræ are roundish: The *pistillum* consists of more than five germina; the styli are simple, the stigmata obtuse: The *pericarpium* consists of compressed capsulæ: The *seeds* are small and solitary. Of this genus there are eight

Species, viz. The plantago, or great water-plantain, which grows in all the marshy parts of this country; the ranunculoides, or lesser water-plantain; the nataus, or creeping water-plantain; the damasonium, or star-headed water-plantain; all which are natives of Britain. The others, viz. the flava, cordifolia, subulata, and parnassifolia, are natives of America, where they are generally found in stagnating waters, and other swampy places; so that it would be difficult to preserve them in Britain, for they will not live in the

Alifontia
||
Alkali.

open air, and they require a bog to make them thrive : but as they are plants of no great beauty or use, it is not worth while to cultivate them in this country.

ALISONTIA, or ALISUNTIA, (anc. geog.); a river of Belgic Gaul, now *Alfitz*; which rising on the borders of Lorrain, and running through the duchy, waters the city of Luxemburg, and, swelled by other rivulets, falls into the Sur.

ALITES, in Roman antiquity, a designation given to such birds as afforded matter of auguries by their flight.

ALKADARII, a sect among the Mahometans who deny any eternal, fixed, divine decrees, and are asserters of free will. The word is formed from the Arabic *alkadar*, which signifies "decree." The Alkadarii are a branch of Motazalites, and stand opposed to the Algiabarii. See ALGIABARII.

ALKAHEST, or ALCAHEST, in chemistry, an universal menstruum capable of resolving all bodies into their first principles. Van Helmont pretended he was possessed of such a menstruum; but, however credulous people might be imposed on in his days, the notion is now become as ridiculous as the philosopher's stone, the perpetuum mobile, &c.—It is likewise used by some authors for all fixed salts volatilized.

ALKALI, in chemistry, one of the general divisions of salts, comprehending that class of chemical elements which, by their union with acids, form *perfect neutrals*, in opposition to the salts formed of acids with metals or earths, which are called *imperfect*.

Alkaline salts are divided into two kinds, the fixed and volatile; and the former into two species, vegetable, and mineral or fossil. All of these possess some properties in common, and some peculiar to each. Those which they have in common are, 1. An acrid and pungent taste, which, when the salts are very pure and strong, degenerates into absolute causticity, and would entirely destroy the organ of sensation if long applied to it. 2. A tendency to dissolve animal substances, and reduce them to a gelatinous substance, which all of them will do when very strong. 3. An attraction for acids, with a power of separating earths and metals from them, though previously combined with the same. 4. They change the blue vegetable juices to green; the green to yellow; the yellow to orange; the orange to red; and the red to purple. 5. They unite with oils, and destroy or cause to fade almost all kinds of colours that can be put upon cloth, whence their use in bleaching, &c.

1
Properties
common to
all the alka-
line salts.

2
Properties
common to
the two fix-
ed alkalis.

3
Of the vo-
latile alkali.

The properties common to both kinds of fixed alkalis are, 1. They resist the action of fire to a great degree, so that they can easily be reduced to a solid form by evaporating any liquid in which they happen to be dissolved. 2. By an intense fire, they flow into a liquid which concretes into an hard and solid mass in the cold. 3. When mixed in certain proportions with those earths or stones called *vitriifiable*, they melt, in a heat still more intense, into glass. 5. Mixed with ammoniacal salts, with animal substances, or with foot, they extricate a volatile alkali.

The volatile alkali differs from the other two in being unable to resist the fire, and being entirely resolvable into an invisible and permanently elastic fluid, called by Dr Priestley *alkaline air*. In consequence of this volatility, it always affects the olfactory nerves

very perceptibly, and its smell is the general criterion by which its strength may be judged of. Its attraction for acids, power of changing colours, &c. are also considerably weaker than those of the fixed alkalis.

Alkali.

Though two sorts of volatile alkali are commonly sold under the names of spirits of hartshorn and of sal ammoniac, the one differs from the other only in its degree of purity. The former is so called from its being originally made from the horns of deer; but this material has long been laid aside, and the bones of horses, the *flints*, as they are called, of the horns of cattle, the parings of hoofs, &c. have been substituted in their stead. This kind, however carefully prepared, always contains a portion of animal oil, the smell of which is very perceptible; the other, prepared from pure sal ammoniac, is totally free of any empyreumatic smell, and is as pure as it can be obtained by any means whatever.

Efferescence with acids was formerly supposed to be a distinguishing property of alkalis, though it was always known that by a mixture with quicklime they might be deprived of this property. Dr Black, however, has shown, that the efferescing with acids is no property of pure alkali, but is occasioned only by the escape of fixed air from it: of consequence, when quicklime is added, which attracts the whole or greatest part of the fixed air, no efferescence can be perceived. In the state in which the fixed alkalis are commonly met with, indeed, efferescence with acids may be said to be an essential property; but this is entirely owing to the cause just mentioned, *viz.* a quantity of fixed air, to which they are united during the process by which they were originally formed. The quantity of this air, however, is never so great as to saturate them entirely; on the contrary, their alkaline properties are always very perceptible, and they are commonly said to be in a *mild* state. But the truth is, that now they are in a kind of intermediate state between what may be called perfectly mild and perfectly caustic. In their perfectly mild state, they are united with such a large quantity of fixed air as entirely overpowers their alkaline properties; and therefore they are no more intitled to the name of alkalis in this state, than when combined with the marine, nitrous, or any other acid; in which case the compounds are called neutral salts. But it is a much more laborious and tedious process to saturate an alkali completely with fixed air than with any other acid; nor does it very easily retain the aerial acid after it has once been combined with it. Hence the caustic taste and properties of the alkali almost always predominate, and the salt contains a portion of pure and caustic alkali, to which alone its virtues are to be ascribed.

Vegetable alkali is obtained in its greatest purity by deflagrating nitre with charcoal, provided we make use of no more of the latter than is barely sufficient to destroy the nitrous acid. It is, however, a very difficult matter to adjust this proportion with sufficient accuracy; for if we employ too much charcoal, the salt will be considerably phlogisticated; if too little, some part of the nitre will remain undecomposed. Burnt tartar therefore, purified by solution and filtration, may be looked upon as the best alkali we have. The common alkalis, or *ashes* as they are called, and said to be obtained from the ashes of vegetables, are always mixed

4

acids not a
characteristic
of alkali.

5
Preparation
of the ve-
getable al-
kali.

Alkali. ed with much phlogiston, and sometimes with lime, salt, or other heterogeneous matters; for which reason they are not to be employed in the nicer chemical experiments, without being purified by solution in water, by filtration, and crystallization. The purest of all these salts is that called the *blue pearl*, imported from Hungary.

6 Its peculiar properties. The vegetable alkali when thus purified, and containing near one half its weight of fixed air, is of a white colour when dry, with a very hot and caustic taste, possessing in an eminent degree all those qualities which have been ascribed to the alkaline salts in general. It runs *per deliquium* when exposed to the air; and is usually incapable of being crystallized, though it acquires this property after being employed in the rectification of ardent spirit. It adheres more closely to acids than any substance hitherto discovered; though, from some experiments, Bergman was induced to believe that pure terra ponderosa attracted acids still more powerfully. But this has been discovered to be a mistake by Dr Withering, who, in a paper published in the 74th volume of the Philosophical Transactions, shows, that unless where the earth is united with vitriolic acid, not only the vegetable, the fossil, but even the volatile alkali in its pure or caustic state, will separate it from any other with which it may be combined. Terra ponderosa, therefore, will always decompose vitriolated tartar, Glauber's salt, or vitriolic ammoniac; whence the mistake of this celebrated chemist probably has proceeded. After this alkali has been once united with marine acid, it appears to have undergone some change; for the salt then produced, by combining it with the vitriolic acid, resembles Glauber's salt almost as much as it does vitriolated tartar. It seems therefore to have made some approach towards the nature of fossil alkali; but chemists have not inquired what would be the consequence of repeated combinations of this kind.

7 Of the fossil alkali. The fossil alkali differs from the vegetable in having a smaller attraction for acids, in being more easily fusible by itself, and forming a more soluble compound with the vitriolic acid. It is also easily crystallizable, even without the addition of more fixed air than it naturally contains: and experience has determined it to be more proper for glass or soap manufactures than the vegetable alkali; for which reason the demand for it is very considerable.

8 This alkali known to the ancients. The fossil alkali was anciently called *natron* or *nitre*, and is spoken of by Pliny and Tacitus as an ingredient in glass, &c. and the scriptures inform us that it was used in baths. The knowledge of this salt was lost in the general obscuration of science which took place on the decline of the Roman empire; nor do we find it mentioned till the time of the Hon. Robert Boyle; and, even since that time, though M du Hamel gave an accurate account of it in a memoir for the year 1736, little farther notice was taken of it till very lately.

9 Found native in many parts of the world. We are now certainly informed that the fossil alkali is found native in many parts of the world, which never is the case with the vegetable alkali. The places where it abounds most are, Egypt, the country of Tripoli in Barbary, the peak of Teneriffe in one of the Canary islands, Hungary, several of the provinces of Russia, some parts of Asia, particularly the neighbour-

hood of Smyrna, &c. though it has not hitherto been found in any of the western countries of Europe, excepting in the neighbourhood of volcanoes, or in mineral waters; and in these last only in very small quantity.

The great source of the mineral alkali, however, and from whence it is not improbable that the places already mentioned have been supplied by some unknown natural operation, is the water of the ocean. Fossil alkali is the natural basis of sea-salt; and could any method of readily procuring it from this salt be fallen upon, it would no doubt be a most valuable secret. Hitherto, however, all the methods used with any success by the chemists may be reduced to two. 1. By mixing the nitrous acid with sea-salt in a retort, in the proportion, according to Dr Vogel, of four of the acid to one of the salt, and distilling off the muriatic acid, or rather aqua regia, which will be produced in the process. The residuum will afford a cubical nitre by crystallization, from whence the alkali may be obtained pure by deflagrating with charcoal. 2. By addition of vitriolic acid the spirit of sea-salt will be expelled much more easily, and at a cheaper rate, than by the nitrous acid. The residuum affords Glauber's salt in great plenty: this being melted in a crucible with a sufficient quantity of charcoal-dust, forms a hepar sulphuris; which being decomposed by means of the vegetable acid, the latter may be destroyed by force of fire, and the alkali obtained in purity. For a further explanation of both these methods, see the article CHEMISTRY, *Index*.

The demand in this country for fossil alkali is supplied from the ashes of kali and other sea plants, from which it is separated in the same manner as the vegetable alkali from the ashes of other plants. The purest kind of ashes containing this salt is called *soda* or *barrilla*, and is imported chiefly from foreign countries; that which is obtained from the sea-weed growing on our own coasts, and known by the name of *kelp*, is excessively impure, and scarce admits of being thoroughly analysed according to the rules of chemistry.

Both these alkalis may be deprived of their fixed air, and thus rendered pure and caustic, by the addition of quicklime. In this state the difference between them is much less perceptible than in any other, though the addition of fixed air, or any other acid, always shows that no essential change has taken place in either. In this highly caustic state they destroy the parts of animals in a manner similar to that of fire; whence they are called *potential* cauteries, as the former is called the *actual* cautery. M. Morveau informs us, that on digesting a piece of beef in a solution of caustic vegetable alkali, the liquor soon became red, and the flesh assumed the form of a semitransparent jelly, in which, however, one could easily perceive the ramifications of the smallest fibre; and, after standing some months, it emitted but very little smell. The vegetable alkali is commonly made use of as the material for the common caustic or *lapis infernalis* of the shops; for the preparation of which, see CHEMISTRY, *Index*. Both alkalis attract moisture from the air when reduced to a solid form in their caustic state, though neither the fossil alkali nor its combinations do so in any other case. In their caustic state also they only unite with oils, or dissolve in spirit of wine; which last they

Alkali. they have been supposed to purify, though it is more than probable that they decompose and communicate disagreeable qualities to it.

¹²
Volatile alkali in its mild and caustic states.

The volatile alkali, when procured immediately by the distillation of any substance capable of yielding it, is obtained in a state similar to that in which the alkalis are usually met with, viz. half mild and half caustic. By exposing the liquid alkali to a great quantity of fixed air, we may at last have it perfectly mild and neutralised; in which state it appears as a white salt extremely volatile, though less so than the pure caustic alkali. It dissolves very readily in water; but unless some caustic spirit, or some lime or fixed alkali be added, in order to abstract part of the fixed air, it will scarcely exhibit the characteristic of volatile alkali, viz. a pungent and urinous smell. The addition of fixed air, however, makes very little difference with regard to the chemical combinations of this salt; for as fixed air has a very slender power of acidity, it is expelled by every other acid with the greatest ease, and the same combinations formed as though it had not been present. The only difference is, that when a mild alkali is added to an acid, a strong effervescence takes place by reason of the escape of the fixed air through the liquid, while with the caustic alkali the mixture is made quietly and without disturbance.

The various combinations of the alkaline salts with the different acids, and the neutral compounds thence resulting, are exhibited in the following table.

1. Vegetable fixed alkali combined with

Vitriolic acid	} forms	Vitriolated tartar.
Nitrous acid		Nitre.
Marine acid		Sal digestivus.
Acetous acid		Terra foliata tartari.
Acid of tartar		Soluble tartar.
Acid of borax,		} { Anomalous salts, whose properties have not been ascertained.
Acid of phosphorus,		
Saccharine acid, &c.		
Aerial acid	Mild or aerated alkali.	

2. Fossil or mineral fixed alkali combined with

Vitriolic acid	} forms	Glauber's salt.
Nitrous acid		Cubical nitre.
Marine acid		Common salt.
Acetous acid		A salt resembling terra foliata tartari, but which does not deliquesce.
Acid of tartar		Rochelle salt.
Acid of borax	} { Unknown salts.	Borax.
Acid of phosphorus,		
Saccharine acid, &c.		
Aerial acid	Mild fossil alkali.	

3. Volatile alkali combined with

Vitriolic acid	} forms	Vitriolic ammoniac, or Glauber's secret sal ammoniac.
Nitrous acid		Nitrous ammoniac, or volatile nitre.
Marine acid		Common sal ammoniac
Acetous acid		Spiritus mindereri.

Alkali. Volatile alkali combined with

Acid of tartar	} forms	} A salt whose properties have not been investigated; which shoots into fine long crystals, and does not deliquesce in the air.		
Acid of borax			} An anomalous salt.	
Acid of phosphorus				Microcosmic salt, or essential salt of urine.
Saccharine acid, &c.				Anomalous salts.
Aerial acid		Volatile sal ammoniac, or salt of hartshorn.		

Besides their attraction for acids, the alkalis have also an attraction for oils, sulphur, and spirit of wine, in the moist way, when the salts are deprived of their fixed air; and in this, as well as the dry way, with several metals, and vitrifiable earths and stones, as has been already mentioned.

With oil the vegetable fixed alkali forms a soap, though less perfect than that made with the caustic mineral alkali. When combined with fixed air they scarcely unite with oils. Boiled with sulphur, or melted with it in their dry state, they unite into a very fetid compound called *hepar sulphuris*, which is soluble in water, but totally and very quickly decomposed by the contact of air. Vegetable alkali unites with iron, tin, and zinc; corrodes copper, and runs with it into a liquor of a deep blue colour, and joins with lead in fusion. It does not act upon gold in its metallic state; but if a sufficient quantity be added to a solution of gold in aqua regia, the calx of the metal will be first precipitated and afterwards dissolved.

Vegetable alkali is a principal ingredient in the powders called *fluxes*, used for the fusion of metalline ores. It promotes the fusion of earths, and forms glass with the crystalline kind. It is soluble in an equal weight of distilled water; and, when exposed to the air, it soon attracts moisture from it and flows into a liquid. In its caustic state it dissolves in spirit of wine, and forms with it a red tincture called *Van Helmont's tincture of salt of tartar*, formerly used both as an internal and external remedy, but now fallen into disrepute.

Fossil alkali in its caustic state unites with oil into an harder soap than that made with vegetable alkali. With sulphur it forms a *hepar sulphuris* in the same manner as the vegetable alkali, and yields a tincture with spirit of wine, which dissolves part of the salt whilst hot, but lets it fall again in a crystalline form when cold. Gold, silver, or quicksilver, are not affected by a solution of this salt; but copper and tin are dissolved by it in the open air. It affects tin, lead, regulus of antimony, and cobalt, slightly; but acts powerfully upon zinc, and forms a kermes mineral with crude antimony. Copper, iron, bismuth, zinc, antimony, and regulus of cobalt, fused with two parts of fossil alkali, are almost entirely dissolved in a very strong heat; but tin, lead, and regulus of antimony, treated in the same manner, only suffer a partial solution.

All the alkalis are of considerable use in medicine, though

Alkali.

14
Medical
virtues of
alkaline
salts.

though the particular virtues of vegetable and fossil alkali have not hitherto been properly ascertained. It is probable, however, that there must be a considerable diversity in their operations on the human body, as the vegetable alkali shows itself so much more acrid and powerful than the fossil. As both of them unite immediately with acids, and change them into mild neutral salts; hence, if any of the strong mineral acids should fall upon any part of the human body, and begin to corrode and give pain, the immediate application of the lixivium tartari, or of a solution of any of those alkaline salts in water, or of the salts themselves in powder, will destroy their causticity, and prevent their doing further mischief: Or if any of these acids should drop on clothes, linen, or other substances, and alkaline salts are immediately applied, they will neutralize the acid, and prevent its further corrosion: Or if a person should, through mistake, swallow any of the mineral acids, or corrosive sublimate, or any other corroding salt which an alkali will decompose, the taking down into the stomach solutions of the alkaline salts, or the salts themselves in proper doses, are the most likely means of affording relief, if not given too late (A).

Both the vegetable and fossil alkali applied externally in a caustic state, first irritate and inflame the skin, and afterwards act as fire in mortifying and destroying it; and therefore have been much used by surgeons for opening buboes and other abscesses, and for eating away proud or fungous flesh that sprouts out from sores. Various formulæ of caustic alkalis have been employed for these purposes, of which an account is given under CHEMISTRY and PHARMACY.

The alkaline salts, when much diluted with water, have been used as washes for removing pimples from the face; but if such washes are continued long, they are apt to spoil the skin. The ancients often used to dissolve natron (the fossil alkali) in their baths, and esteemed such baths useful for removing itchings of the skin, the scab, the impetigo, leprosy, and almost all sorts of cutaneous eruptions; and they employed baths of the same kind for promoting sweat, and for curing various disorders. They mixed it likewise with turpentine, with oils, and with stuffs of various kinds, and rubbed or applied such compositions to the skin, for removing different complaints, to heal sores, to strengthen weak or relaxed parts, to destroy the poison of the bite of a mad dog, and of serpents; and they esteemed it as an antidote against many other poisons.

15
Do not act
as antiseptic
when
taken into
the human
body.

It has been proved that alkaline salts preserve animal substances from putrefaction; on which account some practitioners have concluded that they act as strong antiseptic remedies when swallowed as medicines, and are taken up by the lacteal vessels, and by them carried to the subclavian vein to be mixed with the blood. Experience, however, has shown that they have effects directly opposite, and that by stimulating the vessels and quickening the circulation, they contribute towards

the dissolution of the vital fluid; of which Dr Monro says he has seen several instances.

Alkali.

Alkalis promote the secretions in general, particularly by the kidneys; but by the help of warm liquors and bed-clothes, their operation may be directed towards the skin. They have also been employed in cases of heartburn, and others where an acid prevails in the stomach and bowels, or where these organs are loaded with viscid phlegm. They are likewise given with a view to assist the operation of the bile when it is too weak and inert, either by themselves, or mixed with purgative or other medicines. The fossil alkali has been alleged to be a more powerful solvent of the human calculus than the vegetable, though perhaps without any just foundation. It is given from 5 to 20 grains three times a-day; and in some cases even to double that quantity. It may be taken in any common liquor, or in clear broth made of lean meat, from which the fat has been skimmed off; or the powdered salts may be made up into pills or boluses mixed with liquorice powder, by means of mucilage of gum Arabic or conserve.

The vegetable alkali has long been used as a diuretic in dropsies with great success; and Dr Monro informs us, that he has seen a number of cases of anasarca in which the water was carried off by it. As diuretics, it may be taken from ten grains to half a drachm, or more, two or three times a-day, mixed with some distilled water, syrup, broth, or water-gruel, or with two ounces of white-wine, which partly neutralizes the salt. When added to infusions of juniper-berries, broom-tops, horse-radish, mustard-seed, winter's-bark, &c. in wine and beer, they prove powerful diuretics; and Dr Monro gives the following formula.

16
Are of considerable
use in dropsies.

“Take broom-tops, horse-radish, and juniper-berries, of each an ounce; bruise them in a stone or marble mortar; put them into a large wide-mouthed bottle, and add to them an ounce of salt of tartar and two quarts of Rhenish wine. Infuse them for four days; decant off the wine, and filter it through paper for use. Two or three ounces may be taken three or four times a-day.”

Or, “Take an ounce of canella alba, and as much mustard-seed and juniper-berries; bruise them well in an iron mortar, and add an ounce of purified vegetable alkali with two quarts of porter: infuse for four days, and filter the liquor through paper; let the patient take a wine-glass full every four or six hours.”

The diuretic powers of these medicines are sometimes increased by opium, and they have been successfully joined with essential oils and balsams.

The most remarkable property of these salts, however, is that of dissolving the human calculus; for the discovery of which, Mrs Stephens, in the year 1740, obtained a parliamentary reward of 5000 l. At that time Dr Jurins being afflicted with the stone, tried a number of experiments on these medicines; from which he concluded, that their efficacy depended entirely on the

17
An excellent solvent
of the stone.

(A) With regard to the mineral acids, an exception seems to take place if oil of vitriol in its concentrated state should happen to be swallowed; for this contracts such a degree of heat on the contact of any aqueous fluid as would destroy the patient, independent of another cause. An instance we have seen where a person unhappily mistook a bottle of oil of vitriol for water in the night-time. He recovered by swallowing instantly a great quantity of milk. Another recovered by drinking a bottle of Florence oil.

Alkali.

the alkaline salts and lime which they contained; and therefore he began to try what effects a soap-ley would have on himself. At first he took only a few drops, but gradually increased his dose till he came to an ounce, and sometimes an ounce and a half, in a proper vehicle, in 24 hours. This produced the discharge of some small calculi, and relieved him of the symptoms of the stone. Dr Hartley, likewise, laboured under this complaint; and believing that the efficacy of Mrs Stephens's medicines depended on the soap, lime, and alkaline salts which they contained, ordered a paste to be prepared for himself, made of eight ounces of soap, one of oyster-shell lime, a drachm of salt of tartar, and as much water as formed the whole into a soft mass; of which he took large quantities, and found himself greatly relieved, though not cured, as a stone was found in his bladder after his death. These and other instances of success, soon brought the medicines into general use: but though many found relief from them, others, particularly those who were afflicted with the stone, had all the symptoms of their distemper aggravated, by the salts rendering the blood, and other liquors of the body, particularly the urine, sharp and acrid, so as to irritate and inflame the bladder, which was already in too irritable a state, from the constant friction of the calculus lodged within it. The late experiments of Mr Scheele and Sir Torbern Bergman, however, have made it evident, that the human calculus is composed of a concrete acid joined to a small portion of animal earth. Most people, therefore, who are afflicted with the stone or gravel, wish to try the efficacy of these remedies, rather than submit to the dangerous operation of lithotomy; we shall therefore subjoin, from Dr Monro, the following directions for making and using the soap-ley.

18
Monro's
directions
for making
and using
the soap-
ley.

"Take of salt of tartar, eight ounces; of fresh quicklime, four ounces; of distilled water, a quart: mix them all well together in a large bottle, and let them stand for 24 hours; then pour off the ley and filter it through paper, keeping it in well-stopped vials for use. Of this the dose is from 30 drops to three or four drachms, which is to be repeated two or three times in the day.

"One of the best methods of taking this ley is, to mix the quantity to be used in the day with three pints of plain broth, which has been made with the lean part of veal, with all the fat or oily parts separated from it, by putting it, when made, into a large bowl, and skimming them off with a spoon when cold, and to drink, within an hour, a pint of this broth three times in the day—early in the morning—at noon—and in the evening; and to continue the use of this medicine for three, four, or more months; and, during this course, to live on such things as least counteract the operation of the medicine: to take for breakfast some plain broth, such as has been described, with dry toasted bread or biscuit; or a dish or two of tea or coffee in place of the broth: for dinner, to eat the lean part of plain boiled or roasted meat, or a fowl, with their own gravy or juice for sauce; and to eat only of vegetables which contain but little acid, such as potatoes, &c. and to use for drink toast and water, or water with a very small portion of spirit in it; and to abstain from eating fruit and acerbent vegetables, fat meat, butter, or oil; and from drinking wine, beer, cyder, punch, and in short from

N^o 12.

taking any thing which is likely to counteract or destroy the effects of the ley."

Alkali.

With regard to the use of the soap-ley, our author observes, "that he has seen a number of people who have taken it, both for gravellish complaints and for the stone; that many of those who had gravel were relieved, and some of them seemed to be cured; that some few of those who had the confirmed stone, received considerable relief for a time from its use: but the complaints afterwards returned; nor can he say that one complete cure was made; though from the accounts given by the late Dr Whytt of Edinburgh, and others, it should appear that this had sometimes happened: that in many cases of stone the ley occasioned pain and irritation, and increased the violence of the symptoms so much, that the patients were obliged to lay it aside; and that this happened most frequently where the bladder seemed to be already diseased from the irritation of the stone: that at all times it is advisable to lay aside this medicine, at least for a time, whenever it irritates and occasions pain, or where there are appearances of its continued use having broken down the crasis of the blood.

19
Instead of the soap-ley, the following solution of Acrated vegetable alkali, fully saturated with fixed air, has been lately recommended as a powerful solvent of the stone. "Take two ounces of salt of tartar, and dissolve it in two quarts of distilled water, and then saturate it fully with fixed air; and let the patient take eight ounces of it every eight hours. But though many cases have been related in which this medicine is said to have been serviceable, our author says he has seen only one gentleman who had taken it, and who had found considerable relief from it. Soap-ley has likewise been recommended as a solvent of bilious calculi, and has sometimes been of service; but this has probably arisen more from its property of dissolving thick and viscid humours, and assisting the action of the bile, than by acting on the calculi themselves.

20
The volatile alkali has many of the virtues of the Medical virtues of the volatile alkali, fixed, but affects animal substances, particularly in its caustic state, less powerfully than they do. It gives a brisk and strong stimulus to the nerves and fibres of living animals; and is therefore employed in diseases where the pulse is low and the circulation too languid; in low fevers, where the patient is in danger of sinking; in apoplectic and lethargic disorders of elderly people of phlegmatic habits, in paralytic cases, fainting fits, &c. where a brisk and stimulating remedy is wanted. It is often used as a diaphoretic and sudorific in cases of rheumatism, in the end of fevers, catarrhs, and other diseases, where a plentiful diaphoresis or sweat is required; and, according to our author, it is principally owing to this quality that the alkalis have obtained their reputation of being efficacious remedies against the bites of serpents and other venomous animals. It is equally efficacious against mineral acid poisons with the fixed alkali.

21
It now remains only to give some account of the Origin of the alkalis, or that process by which they are naturally produced. This subject, however, is very much involved in obscurity; nor has the origin of fixed alkalis, at least, been investigated with such diligence and success as that of the acids. Chemists have been divided in their opinions, whether alkaline salts be natural

natural

Alkali.

tural bodies, or formed by the force of fire, uniting the principles of which they consist in the burning or distilling the substances from which they are got. It is generally supposed that they are formed by the force of fire intimately uniting an earth, an acid, and an inflammable matter together, so as to form an alkaline salt, which is supposed to be composed of these principles. In support of this opinion, it has been alleged, 1. That the fixed vegetable alkali is produced by burning vegetables which contain the principles fit for forming these salts; though no vestige of an alkali can be discovered in these vegetables in their natural state. 2. That the essential salts of vegetables, which contain an acid and an earth, on being calcined in a crucible with charcoal, yield an alkaline salt. 3. That by alternately allowing the vegetable alkali to run per deliquium, and drying it again, it precipitates a quantity of earth every time it is dissolved; so that the whole of the salt is at last reduced to this kind of earth, while the acid, phlogiston, &c. have evaporated, or been destroyed by the repeated application of heat for drying the salt. 4. In like manner the volatile alkali is produced by distilling animal substances which contain the principles fit for producing it, though no marks of a volatile alkali could be discovered in these substances while they were fresh.

On the other hand, it has been asserted, that the alkaline salts obtained by burning vegetables, or distilling animal substances, existed originally in the materials from which they are procured; that they were generated in the plants by the process of vegetation, and freed by the fire from the other principles which disguised them. In support of this opinion the following arguments are made use of by Messrs Weigleb, Rosenstiel, Morveau, &c. 1. That they had not been able to procure an alkaline salt by mixing earths, oil, and acids together, and subjecting them to the most intense fire. 2. The crystals of tartar, which were formerly believed to be pure acid salts, have been found by late experiments to contain a vegetable alkali. 3. The vegetable alkaline salt, when purified, is always of the same nature, from whatever substance it is procured; and therefore must have been an original principle or body existing in the vegetables from which it is procured: for had it been produced by art, it would have varied, and we should have had different species of it, according to the principles which the plants contained. And, 4. The neutral salts which have been found mixed with the ashes of plants, as vitriolated tartar, nitre, and sea-salt, are likewise strong proofs of the original existence of alkali in vegetables.

On this subject Dr Monro observes, that hitherto we have not sufficient evidence to determine positively whether the vegetable alkali be produced by the force of fire, or if it existed originally in the substances from which it is prepared, though he is inclined to favour the former opinion. With regard to the volatile alkali, however, we have abundant evidence of its being produced from substances which could not possibly be supposed to contain it originally. Dr Stahl assures us, that if any dry fixed alkaline salt be well rubbed in a mortar with such a quantity of oil of turpentine as is sufficient to make it of the consistence of a pulp, and digested for some weeks in a cucurbit or retort, we obtain a volatile alkali. Mr Geoffroy relates, that having

placed a large retort in a sand furnace, and adapting a tubulated receiver to it, afterwards heating the bottom of the retort red hot, he put into it, by means of a long tube rising from the upper part of the neck, a powder composed of equal parts of nitre and charcoal, on which there came over into the receiver a liquor highly impregnated with volatile alkali. Cartheuser, in the first volume of his *Materia Medica*, tells us, that if two parts of salt of tartar be mixed with one of sulphur, and be afterwards distilled, they yield a volatile alkaline salt and spirit. Boerhaave and Macquer have both affirmed, that the vegetative process itself produces a volatile alkali; and that the juices got by bruising mustard-seed and other alkalescent vegetables, as they are called, contain a volatile alkali which effervesces with acids: but this is denied by Cartheuser and Vogel, who affirm that they could discover no traces of volatile alkali in these juices by any experiments they made.

But whatever may be concluded from the experience of former chemists, the late discoveries of Dr Priestley and Mr Cavendish have decisively shown, that the volatile alkali is by no means a simple element or natural principle, but a compound, and which may be artificially prepared. Dr Priestley informs us, that by the union of nitrous air with iron, a volatile alkali is generated; and Mr Cavendish, that by the action of the electric fluid, or pure elementary fire, upon phlogisticated air, the nitrous acid is produced: the volatile alkali, therefore, must be supposed to consist ultimately of phlogisticated air united to a great quantity of elementary fire. In like manner, if we can suppose this subtle element to enter into the substance of any kind of earth in such a manner as to exert its peculiar action when that substance is applied to any other, we may reasonably conclude that the fixed alkalis also are not simple and permanent principles, but capable of artificial composition and decomposition. It is certain that the action of alkaline salts is extremely similar to that of fire; and as we know that this element is combined in a latent state with fluids, there can be no absurdity in supposing it capable of combining also with solids.

ALKALI, or *Sal Kali*, in botany. See SALICORNIA.

ALKANET, in botany. See ANCHUSA.

ALKEKENGI, in botany, the trivial name of a species of physalis. See PHYSALIS.

ALKENNA, in botany. See LAWSONIA.

ALKERMES, in pharmacy, a compound cordial medicine made in the form of a confection, deriving its name from the kermes-berries used in its composition.

ALKORAN. See ALCORAN.

ALL-HALLOWS. See ALL-SAINTS.

ALL-GOOD. See CHENOPODIUM.

ALL-HEAL. See HERACLEUM and STACHYS.

ALL-SAINTS, in the calendar, denotes a festival celebrated on the first of November, in commemoration of all the saints in general; which is otherwise called *All-hallows*. The number of saints being so excessively multiplied, it was found too burdensome to dedicate a feast-day to each. In reality, there are not days enough, scarce hours enough, in the year, for this purpose. Hence an expedient was had recourse to, by commemorating such in the lump as had not their own days. Boniface IV. in the ninth century, introduced

Alkali

All-Saints.See Aerology, n^o 149.See Acid, n^o 7.

All-Saints the feast of *All Saints* in Italy, which was soon after adopted into the other churches.

Bay
||
Allatius.

ALL-SAINTS Bay, a spacious harbour near St Salvador in Brazil, in S. America, on the Atlantic Ocean. W. long. 40°, S. lat. 12°.

ALL-Souls, in the calendar, denotes a feast-day, held on the second of November, in commemoration of all the faithful deceased.—The feast of All-Souls was first introduced in the eleventh century, by Odilon abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches.

ALL-SPICE. See MYRTUS and CALYCANTHUS.

ALLA, or *ALLAH*, the name by which the professors of Mahometanism call the Supreme Being.

The term *alla* is Arabic, derived from the verb *alah*, to adore. It is the same with the Hebrew *Eloah*, which signifies the *Adorable Being*.

ALLAMANDA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The characters are: The *calyx* is a five-leav'd perianthium: The *corolla* consists of one funnel-shaped petal; the tube cylindric; the border semiquinquefid and ventricose; the divisions expanding and obtuse: The *stamina* have scarce any filaments; the antheræ are five, arrow-shap'd, converging, in the throat of the tube: The *pisillum* has an oval germen, girt at the base with an annular margin; the stylus is filiform, the length of the tube; the stigma is headed, and contracted in the middle: The *pericarpium* is an orbicular, compress'd, bristly capsule, containing one cell with two valves: The *seeds* are imbricated, orbicular, flat, with a membranaceous wing on the margin, and are very numerous. There is but one species, the cathartica, a native of Surinam.

ALLANTOIS, or *ALLANTOIDES*, a gut-shaped vesicle investing the fœtus of cows, goats, sheep, &c. filled with an urinous liquor conveyed to it from the urachus.—(See *COMPARATIVE Anatomy*). Anatomists are not agreed whether the allantois has any existence in the human species or not.

ALLATIUS (Leo), keeper of the Vatican library, a native of Scio, and a celebrated writer of the 17th century. He was of great service to the gentlemen of Port Royal in the controversy they had with M. Claude touching the belief of the Greeks with regard to the eucharist. No Latin was ever more devoted to the see of Rome, or more inveterate against the Greek schismatics, than Allatius. He never engaged in matrimony, nor was he ever in orders; and Pope Alexander VII. having asked him one day, why he did not enter into orders? he answered, "Because I would be free to marry." The pope rejoined, "If so, why do you not marry?" "Because," replied Allatius, "I would be at liberty to take orders." Thus, as Mr Bayle observes, he passed his whole life, wavering betwixt a parish and a wife; sorry, perhaps, at his death, for having chosen neither of them; when, if he had fixed upon one, he might have repented his choice for 30 or 40 years.—If we believe John Patricius, Allatius had a very extraordinary pen, with which, and no other, he wrote Greek for 40 years; and we need not be surpris'd, that, when he lost it, he was so griev'd, that he could scarce forbear crying. He published several manuscripts, several translations of Greek authors,

and several pieces of his own composing. In his compositions he is thought to show more erudition than judgment: he us'd also to make frequent digressions from one subject to another. He died at Rome in 1669, aged 83.

ALLAY. See *ALLOY*.

ALLEGATA, a word anciently subscribed at the bottom of rescripts and constitutions of the emperors; as *signata*, or *testata*, was under other instruments.

ALLEGGEAS, or *ALLEGIAS*, a stuff manufactured in the East-Indies. There are two sorts of them; some are of cotton, and others of several kinds of herbs, which are spun like flax and hemp. Their length and breadth are of eight ells, by five, six, or seven eighths; and of twelve ells, by three-fourths, or five-eighths.

ALLEGIANCE, in law, is the tie, or *ligamen*, which binds the subject to the king, in return for that protection which the king affords the subject. The thing itself, or substantial part of it, is founded in reason and the nature of government; the name and the form are derived to us from our Gothic ancestors. Under the feudal system, every owner of lands held them in subjection to some superior or lord, from whom or from whose ancestors the tenant or vassal had received them: and there was a mutual trust or confidence subsisting between the lord and vassal, that the lord should protect the vassal in the enjoyment of the territory he had granted him; and, on the other hand, that the vassal should be faithful to the lord, and defend him against all his enemies.

This obligation on the part of the vassal was called his *fidelitas* or fealty: and an oath of fealty was required by the feudal law to be taken by all tenants to their landlord, which is couched in almost the same terms as our ancient oath of allegiance; except that, in the usual oath of fealty, there was frequently a saving or exception of the faith due to a superior lord by name, under whom the landlord himself was perhaps only a tenant or vassal. But when the acknowledgment was made to the absolute superior himself, who was vassal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant swore to bear faith to his sovereign lord, in opposition to all men, without any saving or exception. Land held by this exalted species of fealty, was called *feudum ligium*, a liege fee; the vassals *homines ligii*, or liege men; and the sovereign, their *dominus ligius*, or liege lord. And when sovereign princes did homage to each other for lands held under their respective sovereignties, a distinction was always made between *simple* homage, which was only an acknowledgement of tenure; and *liege* homage, which included the fealty before-mentioned, and the services consequent upon it. In Britain, it becoming a settled principle of tenure, that all lands in the kingdom are holden of the king as their sovereign and lord paramount, no oath but that of fealty could ever be taken to inferior lords; and the oath of allegiance was necessarily confined to the person of the king alone. By an easy analogy, the term of *allegiance* was soon brought to signify all other engagements which are due from subjects to their prince, as well as those duties which were simply and merely territorial. And the oath of allegiance, as administered in England for upwards of 600 years, contained a promise "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to

Alley
||
Allegiance.

Allegiance "know or hear of any ill or damage intended him, without defending him therefrom." But, at the revolution, the terms of this oath being thought perhaps to favour too much the notion of non-resistance, the present form was introduced by the convention parliament, which is more general and indeterminate than the former; the subject only promising "that he will be faithful and bear true allegiance to the king," without mentioning "his heirs," or specifying in the least wherein that allegiance consists. The oath of supremacy is principally calculated as a renunciation of the pope's pretended authority: and the oath of abjuration, introduced in the reign of King William, very amply supplies the loose and general texture of the oath of allegiance; it recognizing the right of his majesty, derived under the act of settlement; engaging to support him to the utmost of the juror's power; promising to disclose all traitorous conspiracies against him; and expressly renouncing any claim of the descendants of the late pretender, in as clear and explicit terms as the English language can furnish. This oath must be taken by all persons in any office, trust, or employment; and may be tendered by two justices of the peace to any person whom they shall suspect of disaffection. And the oath of allegiance may be tendered to all persons above the age of twelve years, whether natives, denizens, or aliens.

Blackstone's
Comment.

But, besides these express engagements, the law also holds that there is an implied, original, and virtual allegiance, owing from every subject to his sovereign, antecedently to any express promise, and although the subject never swore any faith or allegiance in form. Thus Sir Edward Coke very justly observes, that "all subjects are equally bounden to their allegiance as if they had taken the oath; because it is written by the finger of the law in their hearts, and the taking of the corporal oath is but an outward declaration of the same."

Allegiance, both express and implied, is however distinguished by the law into two sorts or species, the one natural, the other local; the former being also perpetual, the latter temporary.

Natural allegiance is such as is due from all men born within the king's dominions immediately upon their birth. For, immediately upon their birth, they are under the king's protection; at a time too, when (during their infancy) they are incapable of protecting themselves. Natural allegiance is, therefore, a debt of gratitude; which cannot be forfeited, cancelled, or altered, by any change of time, place, or circumstance, nor by any thing but the united concurrence of the legislature. A Briton who removes to France, or to China, owes the same allegiance to the king of Britain there as at home, and twenty years hence as well as now. For it is a principle of universal law, That the natural-born subject of one prince cannot by any act of his own, no, not by swearing allegiance to another, put off or discharge his natural allegiance to the former: for this natural allegiance was intrinsic, and primitive, and antecedent to the other; and cannot be divested without the concurrent act of that prince to whom it was first due.

Local allegiance is such as is due from an alien, or stranger born, for so long time as he continues within the king's dominion and protection; and it ceases the

instant such stranger transfers himself from this kingdom to another. Natural allegiance is therefore perpetual, and local temporary only; and that for this reason, evidently founded upon the nature of government, That allegiance is a debt due from the subject, upon an implied contract with the prince; that so long as the one affords protection, so long the other will demean himself faithfully.

Allegory.

The oath of allegiance, or rather the allegiance itself, is held to be applicable, not only to the political capacity of the king, or regal office, but to his natural person and blood-royal: and for the misapplication of their allegiance, viz. to the regal capacity or crown, exclusive of the person of the king, were the Spencers banished in the reign of Edward II. And from hence arose that principle of personal attachment and affectionate loyalty, which induced our forefathers (and, if occasion required, would doubtless induce their sons) to hazard all that was dear to them, life, fortune, and family, in defence and support of their liege lord and sovereign.

It is to be observed, however, in explanation of this allegiance, That it does not preclude resistance to the king, when his misconduct or weakness is such as to make resistance beneficial to the community. It seems fairly presumable, that the convention parliament, which introduced the oath of allegiance in its present form, did not intend to exclude all resistance; since the very authority by which the members sat together, was itself the effect of a successful opposition to an acknowledged sovereign.

Paley's Moral and Political Philosophy.

Again: The allegiance above described can only be understood to signify obedience to lawful commands. If, therefore, the king should issue a proclamation, levying money or imposing any service or restraint upon the subject, beyond what the law authorized, there would exist no sort of obligation to obey such a proclamation, in consequence of having taken the oath of allegiance.

Neither can allegiance be supposed to extend to the king after he is actually and absolutely deposed, driven into exile, or otherwise rendered incapable of exercising the regal office. The promise of allegiance implies, that the person to whom the promise is made continues king; that is, continues to exercise the power, and afford the protection, which belong to the office of king: for it is the possession of these which makes such a particular person the object of the oath.

ALLEGORY, in composition, consists in choosing a secondary subject, having all its properties and circumstances resembling those of the principal subject, and describing the former in such a manner as to represent the latter. The principal subject is thus kept out of view, and we are left to discover it by reflection. In other words, an allegory is, in every respect, similar to an hieroglyphical painting, excepting only that words are used instead of colours. Their effects are precisely the same: An hieroglyphic raises two images in the mind; one seen, that represents one that is not seen: An allegory does the same; the representative subject is described, and the resemblance leads us to apply the description to the subject represented.

There cannot be a finer or more correct allegory than the following, in which a vineyard is made to represent God's own people the Jews:

Allegri.

“ Thou hast brought a vine out of Egypt; thou hast cast out the heathen, and planted it. Thou didst cause it to take deep root, and it filled the land. The hills were covered with its shadow, and the boughs thereof were like the goodly cedars. Why hast thou then broken down her hedges, so that all that pass do pluck her? The boar out of the wood doth waste it, and the wild beast doth devour it. Return, we beseech thee, O God of hosts: look down from heaven, and behold, and visit this vine and the vineyard thy right-hand hath planted, and the branch thou madest strong for thyself.” Psal. lxxx.

Nothing gives greater pleasure than an allegory, when the representative subject bears a strong analogy, in all its circumstances, to that which is represented. But most writers are unlucky in their choice, the analogy being generally so faint and obscure, as rather to puzzle than to please. Allegories, as well as metaphors and similes, are unnatural in expressing any severe passion which totally occupies the mind. For this reason, the following speech of Macbeth is justly condemned by the learned author of the Elements of Criticism:

Methought I heard a voice cry, Sleep no more!
Macbeth doth murder Sleep; the innocent sleep;
Sleep that knits up the ravell'd sleeve of Care,
The birth of each day's life, fore Labour's bath,
Balm of hurt minds, great Nature's second course,
Chief nourisher in life's feast. Act. ii. Sc. 3.

But see this subject more fully treated under the article METAPHOR and Allegory.

ALLEGRI (Antonio), called *Corregio* from the place of his birth, an eminent historical painter, was born in the year 1494. Being descended of poor parents, and educated in an obscure village, he enjoyed none of those advantages which contributed to form the other great painters of that illustrious age. He saw none of the statues of ancient Greece or Rome; nor any of the works of the established schools of Rome and Venice. But Nature was his guide; and Corregio was one of her favourite pupils. To express the facility with which he painted, he used to say that he always had his thoughts ready at the end of his pencil.

The agreeable smile, and the profusion of graces which he gave to his madonas, saints, and children, have been taxed with being sometimes unnatural; but still they are amiable and seducing: An easy and flowing pencil, an union and harmony of colours, and a perfect intelligence of light and shade, give an astonishing relief to all his pictures, and have been the admiration both of his cotemporaries and his successors. Annibal Caracci, who flourished 50 years after him, studied and adopted his manner in preference to that of any other master. In a letter to his cousin Louis, he expresses with great warmth the impression which was made on him by the first sight of Corregio's paintings: “ Every thing which I see here (says he) astonishes me; particularly the colouring and the beauty of the children. They live—they breathe—they smile with so much grace and so much reality, that it is impossible to refrain from smiling and partaking of their enjoyment. My heart is ready to break with grief when I think on the unhappy fate of poor Corregio—that so wonderful a man (if he ought not rather to be called an

angel) should finish his days so miserably, in a country where his talents were never known!”

From want of curiosity or of resolution, or from want of patronage, Corregio never visited Rome, but remained his whole life at Parma, where the art of painting was little esteemed, and of consequence poorly rewarded. This concurrence of unfavourable circumstances occasioned at last his premature death at the age of 40. He was employed to paint the cupola of the cathedral at Parma, the subject of which is an assumption of the Virgin; and having executed it in a manner that has long been the admiration of every person of good taste, for the grandeur of design, and especially for the boldness of the fore-shortenings (an art which he first and at once brought to the utmost perfection), he went to receive his payment. The canons of the church, either through ignorance or baseness, found fault with his work; and although the price originally agreed upon had been very moderate, they alleged that it was far above the merit of the artist, and forced him to accept of the paltry sum of 200 livres; which, to add to the indignity, they paid him in copper money. To carry home this unworthy load to his indigent wife and children, poor Corregio had to travel six or eight miles from Parma. The weight of his burden, the heat of the weather, and his chagrin at this villanous treatment, immediately threw him into a pleurisy, which in three days put an end to his life and his misfortunes.

For the preservation of this magnificent work the world is indebted to Titian. As he passed through Parma, in the suite of Charles V. he ran instantly to see the *chef d'œuvre* of Corregio. While he was attentively viewing it, one of the principal canons of the church told him that such a grotesque performance did not merit his notice, and that they intended soon to have the whole defaced. “ Have a care of what you do (replied the other), if I were not Titian, I would certainly wish to be Corregio.”

Corregio's exclamation upon viewing a picture by Raphael is well known. Having long been accustomed to hear the most unbounded applause bestowed on the works of that divine painter, he by degrees became less desirous than afraid of seeing any of them. One, however, he at last had occasion to see. He examined it attentively for some minutes in profound silence; and then with an air of satisfaction exclaimed, *I am still a painter*. Julio Romano, on seeing some of Corregio's pictures at Parma, declared they were superior to any thing in painting he had yet beheld. One of these no doubt would be the famous Virgin and Child, with Mary Magdalene and St Jerom: But whether our readers are to depend upon his opinion, or upon that of Lady Millar, who in her *Letters from Italy* gives a very unfavourable account of it, we shall not presume to determine. This lady, however, speaks in a very different style of the no less famous *Notte* or Night of Corregio, of which she saw only a copy in the Duke's palace at Modena, the original having been sold for a great sum of money to the king of Poland. “ It surprises me very much (says she), to see how different the characters are in this picture from that which I already have described to you. The subject is a Nativity; and the extraordinary beauty of this picture proceeds from the *clair*

obscur;

Allegro *obscure*: there are two different lights introduced, by means of which the personages are visible; namely, the light proceeding from the body of the child, and the moon-light. These two are preserved distinct, and produce a most wonderful effect. The child's body is so luminous, that the superficies is nearly transparent, and the rays of light emitted by it are verified in the effect they produce upon the surrounding objects. They are not rays distinct and separate, like those round the face of a sun that indicates an insurance-office; nor linear, like those proceeding from the man in the almanack; but of a dazzling brightness: by their light you see clearly the face, neck, and hands, of the Virgin (the rest of the person being in strong shadow), the faces of the *pastori* who crowd round the child, and particularly one woman, who holds her hand before her face, lest her eyes should be so dazzled as to prevent her from beholding the Infant. This is a beautiful natural action, and is most ingeniously introduced. The straw on which the child is laid appears gilt, from the light of his body shining on it. The moon lights up the back-ground of the picture, which represents a landscape. Every object is distinct, as in a bright moon-light night; and there cannot be two lights in nature more different than those which appear in the same picture. The virgin and the child are of the most perfect beauty. There is a great variety of character in the different persons present, yet that uniformity common to all herdsmen and peasants. In short, this copy is so admirable, that I was quite sorry to be obliged to lose sight of it so soon; but I never shall forget it. The duke of Modena, for whom Corregio did the original picture, gave him only 600 livres of France for it; a great sum in those days: but at present, what ought it to cost? This great painter's death happened in 1534.

ALLEGRO, in music, an Italian word, denoting that the part is to be played in a sprightly, brisk, lively, and gay manner.

Piu ALLEGRO, signifies, that the part it is joined to should be sung or played quicker; as

Poco piu ALLEGRO intimates, that the part to which it refers ought to be played or sung only a little more briskly than allegro alone requires.

ALLEIN (Joseph), the son of Tobias Allein, was born in the Devises, in Wiltshire, in 1633, and educated at Oxford. In 1655, he became assistant to Mr Newton, in Taunton-Magdalen, in Somersetshire; but was deprived for non-conformity. He died in 1668, aged 35. He was a man of great learning, and greater charity; preserving, though a nonconformist and a severe sufferer on that account, great respect for the church, and loyalty to his sovereign. He wrote several books of piety, which are highly esteemed; but his *Alarm to unconverted sinners* is more famous than the rest. There have been many editions of this little pious work, the sale of which has been very great; of the edition 1672, there were 20,000 sold; of that of 1675, with this title, *A sure guide to heaven*, 50,000. There was also a large impression of it with its first title, in 1720.

ALLELUIAH, or **HALLELUIAH**, a word signifying, *praise the Lord*, to be met with either at the beginning or end of some psalms: such is psalm cxlv. and those that follow, to the end. Alleluiah was sung upon solemn days of rejoicings, Tobit xiii. 12. St John

in the Revelations (xix. 1, 3, 4, 6.) says, that he "heard a great voice of much people in heaven, who said, Alleluiah; and the four and twenty elders, and the four beasts, fell down and worshipped God that sat on the throne, saying *Alleluiah*." This hymn of joy and praises was transferred from the synagogue to the church. St Jerom tells us, that at the funeral of Fabiola several psalms were sung with loud alleluiahs; and that the monks of Palestine were awakened, at their midnight watchings, with the singing of alleluiahs. So much energy has been observed in this term, that the ancient church thought proper to preserve it, without translating it either into Greek or Latin, for fear of impairing the genius and softness of it. The fourth council of Toledo has prohibited the use of it in times of Lent, or other days of fasting, and in the ceremonies of mourning: and, according to the present practice of the Romish church, this word is never repeated in Lent, nor in the obsequies of the dead; notwithstanding which, it is used in the mass for the dead, according to the mosarabic ritual, at the introit, when they sing, *Tu es portio mea, Domine, Alleluia, in terra viventium, Alleluia, Alleluia*. The singing alleluiah was oftentimes an invitatory or call to each other to praise the Lord.

ALLEMAND, a sort of grave solemn music, with good measure, and a slow movement.—It is also a brisk kind of dance, very common in Germany and Switzerland.

ALLEMANNIC, in a general sense, denotes any thing belonging to the ancient Germans. Thus, we meet with Allemannic history, Allemannic language, Allemannic law, &c.

ALLEN (John) archbishop of Dublin in the reign of king Henry VIII. was educated in the university of Oxford; from whence removing to Cambridge, he there took the degree of bachelor of laws. He was sent by Dr Warham, archbishop of Canterbury, to the pope, about certain matters relating to the church. He continued at Rome nine years, and was created doctor of laws; either there or in some other university of Italy. After his return, he was appointed chaplain to Cardinal Wolsey, and was commissary or judge of his court as legate *à latere*; in the execution of which office he was suspected of great dishonesty, and even perjury. He assisted the cardinal in visiting, and afterwards suppressing, 40 of the smaller monasteries, for the erection of his college at Oxford and that at Ipswich. The cardinal procured for him the living of Dalby in Leicestershire, though it belonged to the master and brethren of the hospital of Burton Lazars. About the latter end of the year 1525 he was incorporated doctor of laws in the university of Oxford. On the 13th of March 1528 he was consecrated archbishop of Dublin, in the room of Dr Hugh Inge deceased; and about the same time was made chancellor of Ireland. He wrote, 1. *Epistola de Pallii significatione activa et passiva*; penned by him at the time when he received the archiepiscopal pall. 2. *De consuetudinibus ac statutis in tuitoriis causis observandis*. He wrote also several other pieces relating to the church. His death, which happened in July 1534, was very tragical: for being taken in a time of rebellion by Thomas Fitzgerald, eldest son to the earl of Kildare, he was by his command most cruelly murdered, being

brained

Allen
||
Allerion.

brained like an ox, at Tartaine in Ireland, in the 58th year of his age. The place where the murder was committed was afterwards hedged in, overgrown, and unfrequented, in detestation of the fact.

ALLEN (Thomas), a famous mathematician of the 16th century, born at Uttoxeter in Staffordshire the 21st of December 1542. He was admitted scholar of Trinity-college Oxford the 4th of June 1561; and in 1567 took his degree of master of arts. In 1570 he quitted his college and fellowship and retired to Gloucester-hall; where he studied very closely, and became famous for his knowledge in antiquity, philosophy, and mathematics. Having received an invitation from Henry earl of Northumberland, a great friend and patron of the mathematicians, he spent some time at the earl's house, where he became acquainted with those celebrated mathematicians Thomas Harriot, John Dee, Walter Warner, and Nathaniel Torporley. Robert earl of Leicester had a particular esteem for Mr Allen, and would have conferred a bishopric upon him, but his love of solitude and retirement made him decline the offer. His great skill in the mathematics made the ignorant and vulgar look upon him as a magician or conjurer: the author of a book intitled *Leicester's Commonwealth*, has accordingly accused him with using the art of figuring, to procure the earl of Leicester's unlawful designs, and endeavouring by the black art to bring about a match betwixt him and Queen Elizabeth. But without pretending to point out the absurdity of the charge, it is certain that the earl placed such confidence in Allen, that nothing material in the state was transacted without his knowledge; and the earl had constant information, by letter, from Mr Allen, of what passed in the university. Mr Allen was very curious and indefatigable in collecting scattered manuscripts relating to history, antiquity, astronomy, philosophy, and mathematics: these collections have been quoted by several learned authors, &c. and mentioned to have been in the Bibliotheca Alleniana. He published in Latin the second and third books of Claudius Ptolemy of Pelusium, *Concerning the Judgment of the Stars*, or, as it is commonly called, of the *Quadrupartite Construction*, with an exposition. He wrote also notes on many of Lilly's books, and some on John Bale's work *De Scriptoribus M. Britannia*. Having lived to a great age, he died at Gloucester-hall on the 30th of September 1632.

ALLENDORF, a small town in the circle of the Upper Rhine, and in the landgravate of Hesse-Cassel, remarkable for its salt-works and three stone-bridges. It is seated on the river Weser, 15 miles east of Cassel; E. Long. 10. 5. N. Lat. 51. 26.

ALLER, a river which runs through the duchy of Lunenburg, and falls into the Weser a little below Verden.

ALLER, *good*, in our ancient writers. The word *aller* serves to make the expression of superlative signification; So, *aller-good* is the greatest good. Sometimes it is written *alder*.

ALLERION, or ALERION, in heraldry, a sort of eagle without beak or feet, having nothing perfect but the wings. They differ from martlets by having their wings expanded, whereas those of the martlet are close; and denote imperialists vanquished and disarmed; for which reason they are more common in French than in German coats of arms.

ALLESTRY (Richard, D.D.) an eminent divine, born at Uppington in Shropshire in March 1619, was educated in the grammar-school at Coventry, and afterwards at Christ-church in Oxford. His parts, which were extraordinary, were improved by a no less extraordinary industry. He took up arms for king Charles I. and was sometimes seen with his musket in one hand and his book in the other. He was very active in the service of king Charles II. before his restoration, and was employed by the royalists in transacting business with that prince during his exile; but was at last seized at Dover by a party of soldiers, and committed prisoner to Lambeth-house, where he was confined six or eight weeks: but soon after the restoration he was made canon of Christ-church, created doctor of divinity, and appointed chaplain in ordinary to the king, and regius professor of divinity. In 1665 he was appointed provost of Eton college, where he raised the school, which he found in a low condition, to an uncommon pitch of reputation. The west side of the outward quadrangle of that college was built from the ground at his expence. The excellent Dr Hammond, who was his intimate friend, left him his valuable library, which he himself afterwards bequeathed to his successors in the divinity-chair. He was eminent for his piety, benevolence, and integrity; for the sincerity of his friendship, and his disinterested temper. He wrote several books; and a collection of his sermons were printed after his decease by Dr Fell bishop of Oxford. He died August 28. 1680.

ALLESTRY (Jacob), an English poet of the last century. He was the son of James Allestry, a bookseller of London who was ruined by the great fire in 1666. Jacob was educated at Westminster school, entered at Christ-church Oxford in the act-term 1671, at the age of 18, and was elected student in 1672. He took the degree in arts; was music-reader in 1679, and terræ filius in 1681; both which offices he executed with great applause, being esteemed a good philologist and poet. He had a chief hand in the verses and pastorals spoken in the theatre at Oxford May 21. 1681, by Mr William Savile second son of the marquis of Halifax, and George Cholmondeley second son of Robert viscount Kells (both of Christ-church), before James duke of York, his duchess, and the lady Anne; which verses and pastorals were afterwards printed in the "Examen Poeticum." He died October 15. 1686, and was buried in St Thomas's church-yard.

ALLEVEURE, a small brass Swedish coin, worth about $\frac{1}{2}$ d. English money.

ALLEVIATION, denotes the making a thing lighter, and easier to bear or endure. It stands opposed to *aggravation*.

ALLEY (William), bishop of Exeter in the reign of queen Elizabeth, was born at Great Wycomb in Buckinghamshire. From Eton school, in the year 1528, he removed to king's college Cambridge, where he took the degree of bachelor of arts. He also studied some time at Oxford; afterwards he married, was presented to a living, and became a zealous reformer. Upon queen Mary's accession he left his cure and retired into the north of England; where he maintained his wife and himself by teaching a school, and practising physic. Queen Elizabeth ascending the throne, he went to London, where he acquired great reputation by reading the divinity-lecture at St Paul's, and in

Alleyn.

in July 1560 was consecrated bishop of Exeter. He was created doctor of divinity at Oxford in November 1561. He died on the 15th of April 1570, and was buried at Exeter in the cathedral. He wrote, 1. *The poor man's library*, 2 vol. fol. Lond. 1571. These volumes contain twelve lectures on the first epistle of St Peter, read at St Paul's. 2. *A Hebrew grammar*. Whether it was ever published is uncertain. He translated the Pentateuch, in the version of the Bible which was undertaken by queen Elizabeth's command.

ALLEY, in gardeniug, a straight parallel walk, bounded on both sides with trees, shrubs, &c. and usually covered with gravel or turf.

ALLEY, among builders, denotes a narrow passage leading from one place to another.

ALLEY, in perspective, that which, in order to have a greater appearance of length, is made wider at the entrance than at the termination.

ALLEY, in the new husbandry, implies the vacant space between the outermost row of corn on one bed and the nearest row to it on the next parallel bed; and it is usually about four feet in breadth, exclusive of the partitions between the rows of corn in the beds. The first hoeing of wheat is performed in the beginning of winter, and the earth is ploughed away from the rows into the intervals, which forms small ridges in the middle between the double rows. The second hoeing is in the spring, which turns it back to the rows, leaving a furrow in the middle of the alley. The third hoeing is from the rows, after the wheat has blossomed; this turns the earth into the intervals, forming small ridges there, as at the first hoeing. The fourth hoeing returns the earth to the ridges, which is performed a month or more after the third hoeing. This commonly finishes the horse-hoings, if the land is in good heart; otherwise one or two more hoeings are necessary.

ALLEYN (Edward), a celebrated English actor in the reigns of queen Elizabeth and king James, and founder of the college at Dulwich in Surry, was born at London, in the parish of St Botolph, Sept. 1. 1566, as appears from a memorandum of his own writing. Dr Fuller says, that he was bred a stage-player; and that his father would have given him a liberal education, but that he was not turned for a serious course of life. He was, however, a youth of an excellent capacity, a cheerful temper, a tenacious memory, a sweet elocution, and in his person of a stately port and aspect; all which advantages might well induce a young man to take to the theatrical profession. By several authorities we find he must have been on the stage some time before 1592; for at this time he was in high favour with the town, and greatly applauded by the best judges, particularly by Ben Johnson.

Haywood, in his prologue to Marloe's Jew of Malta, calls him Proteus for shapes, and Roscius for a tongue. He usually played the capital parts, and was one of the original actors in Shakespeare's plays; in some of Ben Johnson's he was also a principal performer: but what characters he personated in either of these poets, it is difficult now to determine. This is owing to the inaccuracy of their editors, who did not print the names of the players opposite to the characters they performed, as the modern custom is; but gave one general list of actors to the whole set of plays, as

in the old folio edition of Shakespeare; or divided one from the other, setting the dramatis personæ before the plays, and the catalogue of performers after them, as in Johnson's.

It may appear surprising how one of Mr Alleyn's profession should be enabled to erect such an edifice as Dulwich College, and liberally endow it for the maintenance of so many persons. But it must be observed that he had some paternal fortune, which, though small, might lay a foundation for his future affluence; and it is to be presumed, that the profits he received from acting, to one of his provident and managing disposition, and one who by his excellence in playing drew after him such crowds of spectators, must have considerably improved his fortune: besides, he was not only an actor, but master of a playhouse, built at his own expence, by which he is said to have amassed considerable wealth. He was also keeper of the king's wild beasts, or master of the royal bear-garden, which was frequented by vast crowds of spectators; and the profits arising from these sports are said to have amounted to 500l. per annum. He was thrice married; and the portions of his two first wives, they leaving him no issue to inherit, might probably contribute to this benefaction. Such kind of donations have been frequently thought to proceed more from vanity and ostentation than real piety; but this of Mr Alleyn has been ascribed to a very singular cause, for the devil has been said to be the first promoter of it. Mr Aubrey mentions a tradition, "that Mr Alleyn playing a demon with six others, in one of Shakespear's plays, was, in the midst of the play, surpris'd by an apparition of the devil; which so worked on his fancy, that he made a vow, which he performed by building Dulwich College." He began the foundation of this college, under the direction of Inigo Jones, in 1614; and the buildings, gardens, &c. were finished in 1617, in which he is said to have expended about 10,000l. After the college was built, he met with some difficulty in obtaining a charter for settling his lands in mortmain: for he propos'd to endow it with 8000l. per annum, for the maintenance of one master, one warden, and four fellows, three whereof were to be clergymen, and the fourth a skilful organist; also six poor men and as many women, besides twelve poor boys to be educated till the age of fourteen or sixteen, and then put out to some trade or calling. The obstruction he met with arose from the lord chancellor Bacon, who wish'd king James to settle part of those lands for the support of two academical lectures; and he wrote a letter to the Marquis of Buckingham, dated August 18. 1618, intreating him to use his interest with his Majesty for that purpose. Mr Alleyn's solicitation was however at last complied with, and he obtained the royal licence, giving him full power to lay his foundation, by his Majesty's letter-patent, bearing date the 21st of June, 1619; by virtue whereof he did, in the chapel of the said new hospital at Dulwich, called "The College of God's Gift," on the 13th of September following, publicly read and published a quadripartite writing in parchment, whereby he created and established the said college; he then subscribed it with his name, and fixed his seal to several parts thereof, in presence of several honourable persons, and ordered copies of the writings to four different

Alleyn
||
Alliance.

different parishes. He was himself the first master of his college; so that to make use of the words of Mr Haywood, one of his contemporaries, "He was fo mingled with humility and charity, that he became his own pensioner, humbly submitting himself to that proportion of diet and clothes which he had bestowed on others." We have no reason to think he ever repented of this distribution of his substance; but on the contrary, that he was entirely satisfied, as appears from the following memorial in his own writing, found amongst his papers: "May 26, 1620—My wife and I acknowledged the fine at the common pleas bar, of all our lands to the college: blessed be God that he has given us life to do it." His wife died in the year 1623; and about two years afterwards he married Constance Kinchtoe, who survived him, and received remarkable proofs of his affection, if at least we may judge of it by his will, wherein he left her considerably. He died Nov. 25. 1626, in the 61st year of his age, and was buried in the chapel of his new college, where there is a tomb-stone over his grave, with an inscription. His original Diary is also there preserved.

The subjoined anecdote is entertaining in itself, and shows the high esteem in which Mr Alleyn was held as an actor: "Edward Alleyn, the Garrick of Shakespeare's time, had been on the most friendly footing with our poet, as well as Ben Johnson. They used frequently to spend their evenings together at the sign of the Globe, somewhere near Black Friars, where the playhouse then was. The world need not be told, that the convivial hours of such a triumvirate must be pleasing as well as profitable, and may truly be said to be such pleasures as might bear the reflections of the morning. In consequence of one of these meetings, the following letter was written by G. Peel, a Fellow of Christ-church college, Oxford, and a dramatic poet, who belonged to the Club, to one Marle, an intimate of his:

"Friend Marle,

"I must desyre that my syster hyr watch, and the cookerie book you promysed, may be sente bye the man.—I never longed for thy company more than last night: we were all very merye at the Globe, when Ned Alleyn did not scruple to asfyrme pleasantly to thy Friende Will, that he had stolen his speech about the Qualities of an actor's excellencye in Hamlet hys Tragedye, from conversations manyfold whych had passed betweene them, and opinyons given by Alleyn touchinge the subjeete.—Shakespeare did not take this talke in good sorte; but Johnson put an end to the strife with wittylye remarkinge, *This affaire needeth no Contentione; you stole it from Ned, no doubt; do not marvel: Have you not seen him act tymes out of number?—Believe me most syncerilie, yours, G. Peele.*"

ALLIA, a river of Italy, which running down a very steep channel from the mountains of Crustumium, mixes with the Tiber at 40 miles from Rome; famous for the great slaughter of the Romans by the Gauls, under Brennus; hence *Alliensis dies*, an unlucky day, (Virgil, Ovid, Lucan.) Our ancestors, says Cicero, deemed the day of the sight of *Allia* more fatal than that of taking the city.

ALLIANCE, in the civil and canon law, the rela-

tion contracted between two persons or two families by marriage.

Alliance
||
Alligation.

ALLIANCE is also used for a treaty entered into by sovereign princes and states, for their mutual safety and defence.—In this sense, alliances may be distinguished into such as are offensive, whereby the contracting parties oblige themselves jointly to attack some other power; and into defensive ones, whereby they bind themselves to stand by and defend each other in case they are attacked by others.—Alliance, with the ancient Romans, though a sort of servitude, was much coveted. Ariaratnes, we are told by Polybius, offered a sacrifice to the gods by way of thanksgiving for having obtained this alliance. The reason was, that thenceforwards people were sure not to receive any injuries except from them.—There were different sorts of allies: some only united to them by a participation of the privileges of Romans, as the Latini and Hernici; others by their very foundation, as the colonies; others by the benefactions they received from them, as Masinissa, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which last by a long alliance became subjects, as the kings of Bithynia, Cappadocia, Egypt, and most of the cities of Greece: lastly, others by compulsive treaties, and the law of subjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an alliance with him; that is, they never subdued any people without using it as a means of subduing others.

The forms or ceremonies of alliances have been various in different ages and countries. Among us, signing and swearing, sometimes at the altar, are the chief; anciently eating and drinking together, chiefly offering sacrifices together, were the customary rite of ratifying an alliance. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs were sacrificed on this occasion. Among the ancient Arabs, alliances were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a sharp stone, dipping herein a piece of their garments, and therewith smearing seven stones, at the same time invoking the gods Vrotalt and Alilat, *i. e.* according to Herodotus, Bacchus and Urania. Among the people of Cholchis, the confirmation of alliances is said to be effected by one of the princes offering his wife's breasts to the other to suck, which he was obliged to do till there issued blood.

ALLIANCE, in a figurative sense, is applied to any kind of union or connection; thus we say, there is an alliance between the church and state.

ALLIGATI, in Roman antiquity, the basest kind of slaves, who were usually kept fettered. The Romans had three degrees, or orders, of slaves or servants; the first employed in the management of their estates; the second in the menial or lower functions of the family; the third called *alligati*, above mentioned.

ALLIGATION, the name of a method of solving all questions that relate to the mixture of one ingredient with another. Though writers on arithmetic generally make alligation a branch of that science; yet, as it is plainly nothing more than an application of the common properties of numbers, in order to solve a few questions that occur in particular branches of business,

Alligation. we choofe rather to keep it diftinct from the fcience of arithmetic.

and almonds at 6d. how many pounds of almonds were **Alligation.** in the mixture ?

Alligation is generally divided into *medial* or *alternate*.

ALLIGATION Medial, from the rates and quantities of the fimples given, difcovers the rate of the mixture.

Rule. As the total quantity of the fimples,
To their price or value ;
So any quantity of the mixture,
To the rate.

Examp. A grocer mixeth 30 lb. of currants, at 4d. per lb. with 10 lb. of other currants, at 6d. per lb. : What is the value of 1 lb. of the mixture ? *Ans.* 4½ d.

lb.	d.	d.
30,	at 4	amounts to 120
10,	at 6	————— 60
—		—————
40		180
lb.	d.	lb. d.

If 40 : 180 :: 1 : 4½

Note 1. When the quantity of each fimple is the fame, the rate of the mixture is readily found by adding the rates of the fimples, and dividing their fum by the number of fimples. Thus,

Suppofe a grocer mixes feveral forts of fugar, and of each an equal quantity, viz. at 50 s. at 54 s. and at 60 s. per cwt. the rate of the mixture will be 54 s. 8d. per cwt. ; for

s. s. d.

50 + 54 + 60 = 164, and 3)164)54 8

Note 2. If it be required to increafe or diminifh the quantity of the mixture, fay, As the fum of the given quantities of the fimples, to the feveral quantities given ; fo the quantity of the mixture propofed, to the quantities of the fimples fought.

Note 3. If it be required to know how much of each fimple is an affigned portion of the mixture, fay, As the quantity of the mixture, to the feveral quantities of the fimples given ; fo the quantity of the affigned portion, to the quantities of the fimples fought. Thus,

Suppofe a grocer mixes 10 lb. of raifins with 30 lb. of almonds and 40 lb. of currants, and it be demanded, how many ounces of each fort are found in every pound or in every 16 ounces of the mixture, fay,

	Oz.
80 : 10 :: 16 :	2 raifins.
80 : 30 :: 16 :	6 almonds.
80 : 40 :: 16 :	8 currants.

Proof 16

Note 4. If the rates of two fimples, with the total value and total quantity of the mixture, be given, the quantity of each fimple may be found as follows, viz. Multiply the leffer rate into the total quantity, fubtract the product from the total value, and the remainder will be equal to the product of the excefs of the higher rate above the lower, multiplied into the quantity of the higher-priced fimple ; and confequently the faid remainder, divided by the difference of the rates, will quote the faid quantity. Thus,

Suppofe a grocer has a mixture of 400 lb. weight, that coft him 7l. 10s. confifting of raifins at 4d. per lb.

VOL. I. Part II.

	lb.	Rates.
	400	6 d.
	4	4 d.
	—	—
	1600 d.	2d.

2)200(100 lb. of almonds at 6 d. is 2 10
And 300 lb. of raifins at 4 d. is 5 0

Total 400

Proof 7 10

ALLIGATION Alternate, being the converfe of alligation medial, from the rates of the fimples, and rate of the mixture given, finds the quantities of the fimples.

Rules. I. Place the rate of the mixture on the left fide of a brace, as the root ; and on the right fide of the brace fet the rates of the feveral fimples, under one another, as the branches. II. Link or alligate the branches, fo as one greater and another lefs than the root may be linked or yoked together. III. Set the difference betwixt the root and the feveral branches right againft their refpective yoke-fellows. Thefe alternate differences are the quantities required. Note, 1. If any branch happen to have two or more yoke-fellows, the difference betwixt the root and thefe yoke-fellows must be placed right againft the faid branch, one after another, and added into one fum. 2. In fome queftions, the branches may be alligated more ways than one ; and a queftion will always admit of fo many answers as there are different ways of linking the branches.

Alligation alternate admits of three varieties, viz. 1. The queftion may be unlimited, with refpect both to the quantity of the fimples and that of the mixture. 2. The queftion may be limited to a certain quantity of one or more of the fimples. 3. The queftion may be limited to a certain quantity of the mixture.

Variety I. When the queftion is unlimited, with refpect both to the quantity of the fimples and that of the mixture, this is called *Alligation Simple*.

Examp. A grocer would mix fugar, at 5 d. 7 d. and 10 d. per lb. fo as to fell the mixture or compound at 8 d. per lb. : What quantity of each must he take ?

	lb.
8 { 5) 2	2
7) 2	2
10) 3, 1	4

Here the rate of the mixture 8 is placed on the left fide of the brace, as the root ; and on the right fide of the fame brace are fet the rates of the feveral fimples, viz. 5, 7, 10, under one another, as the branches ; according to Rule 1.

The branch 10 being greater than the root, is alligated or linked with 7 and 5, both thefe being lefs than the root ; as directed in Rule II.

The difference between the root 8 and the branch 5, viz. 3, is fet right againft this branch's yoke-fellow 10. The difference between 8 and 7 is likewise fet right againft the yoke-fellow 10. And the difference betwixt 8 and 10, viz. 2, is fet right againft the two yoke-fellows 7 and 5 ; as prefcribed by Rule III.

As the branch 10 has two differences on the right, viz.

3 0

viz.

Alligation. viz. 3 and 1, they are added; and the answer to the question is, that 2 lb. at 5d. 2 lb. at 7d. and 4 lb. at 10d. will make the mixture required.

The truth and reason of the rules will appear by considering, that whatever is lost upon any one branch is gained upon its yoke-fellow. Thus, in the above example, by selling 4 lb. of 10 d. fugar at 8 d. per lb. there is 8 d. lost: but the like sum is gained upon its two yoke-fellows; for by selling 2 lb. of 5 d. fugar at 8d. per lb. there is 6d. gained; and by selling 2 lb. of 7 d. fugar at 8d. there is 2d. gained; and 6d. and 2d. make 8d.

Hence it follows, that the rate of the mixture must always be mean or middle with respect to the rates of the simples; that is, it must be less than the greatest, and greater than the least; otherwise a solution would be impossible. And the price of the total quantity mixed, computed at the rate of the mixture, will always be equal to the sum of the prices of the several quantities cast up at the respective rates of the simples.

Variety II. When the question is limited to a certain quantity of one or more of the simples, this is called *Alligation Partial*.

If the quantity of one of the simples only be limited, alligate the branches, and take their differences, as if there had been no such limitation; and then work by the following proportion:

As the difference right against the rate of the simple whose quantity is given,
To the other differences respectively;
So the quantity given,
To the several quantities sought.

Examp. A distiller would, with 40 gallons of brandy at 12s. per gallon, mix rum at 7s. per gallon, and gin at 4s. per gallon: How much of the rum and gin must he take, to sell the mixture at 8s. per gallon?

$$\begin{array}{r}
 \text{Gal.} \\
 8 \left\{ \begin{array}{l} 12 \\ 7 \\ 4 \end{array} \right\} \begin{array}{l} 14 \\ 4 \\ 4 \end{array} \left| \begin{array}{l} 5 \\ 4 \\ 4 \end{array} \right| \begin{array}{l} 40 \text{ of brandy.} \\ 32 \text{ of rum.} \\ 32 \text{ of gin.} \end{array} \right\} \text{Ans.}
 \end{array}$$

The operation gives for answer, 5 gallons of brandy, 4 of rum, and 4 of gin. But the question limits the quantity of brandy to 40 gallons; therefore say,

$$\text{If } 5 : 4 :: 40 : 32$$

The quantity of gin, by the operation, being also 4, the proportion needs not be repeated.

Variety III. When the question is limited to a certain quantity of the mixture, this is called *Alligation Total*.

After linking the branches, and taking the differences, work by the proportion following:

As the sum of the differences,
To each particular difference;
So the given total of the mixture,
To the respective quantities required.

Examp. A vintner hath wine at 3s. per gallon, and would mix it with water, so as to make a composition of 144 gallons, worth 2s. 6d. per gallon: How much wine, and how much water, must he take?

$$\begin{array}{r}
 \text{Gal.} \\
 30 \left\{ \begin{array}{l} 36 \\ 0 \end{array} \right\} \begin{array}{l} 30 \\ 6 \end{array} \left| \begin{array}{l} 120 \text{ of wine.} \\ 24 \text{ of water.} \end{array} \right\} \text{Ans.} \\
 \hline
 36 \quad 144 \text{ total.} \\
 120 \times 36 = 4320 \\
 24 \times 0 = 0
 \end{array}$$

$$\text{Proof } 144 \times 30 = 4320$$

$$\text{As } 36 : 30 :: 144 : 120$$

$$\text{As } 36 : 6 :: 144 : 24$$

There being here only two simples, and the total of the mixture limited, the question admits but of one answer.

ALLIGATOR, in zoology, a synonyme of the *lacerta crocodilus*. See **LACERTA**.

ALLIGATOR Pear. See **LAURUS**.

ALLIONIA, in botany, a genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 48th order, *Aggregateæ*. The characters are: The common *calyx* is oblong, simple, three-flowered, five-parted, and persistent; the proper one, obscure, above: The proper *corolla* is monopetalous and funnel-shaped; the mouth quinquefid and erect: The *stamina* consist of four bristly filaments, longer than the corolla, and bending to one side; the antheræ are roundish: The *ovarium* has an oblong germen beneath; the *stylus* is bristly, and longer than the *stamina*; the *stigmata* are multifid and linear: There is no *pericarpium*: The *seeds* are solitary, oblong, and naked: The *receptaculum* is naked. There are two species, the *violeacea* and *incarnata*, both natives of America.

ALLIOTH, a star in the tail of the greater bear, much used for finding the latitude at sea.

ALLITERATION, an ornament of language chiefly used in poetry, and consisting in the repetition of the same letter at certain intervals. We do not remember to have ever seen any satisfactory account of alliteration in the writings of the critics. They seem to have passed it over in contemptuous silence; either as a false refinement or as a mere trifle. It perhaps deserves a better fate. Many chapters have been composed on quantity, on the expression resulting from different arrangements of long and short syllables, and on the powers of pauses as they are variously placed, without a word of alliteration. This is the more extraordinary, as one should think it impossible for any man to examine minutely, and, as it were, dissect a number of verses, without perceiving the vast abundance of this ornament. It is as if an anatomist should publish a complete table of the arteries in the human body, and affect never to have seen a vein nor a nerve: for it may be affirmed, with small danger of mistake, that if you examine any number of verses, remarkable either for sweetness or for energy, they will be found in some degree alliterative. We do not pretend to say, that the sweetness and energy of versification depends chiefly on this circumstance, yet we cannot help believing that it may claim some share: for it is a constant appearance, as far as we have ever observed, that the poets whose fame is highest for versification, are most extensive dealers in this article.

The trifling poor appearance of the ornament itself, upon

Alligator

Alliteration.

Alliteration.

upon a superficial view, and the frequent abuse of it, are circumstances indeed which give no encouragement to a serious inquiry into its nature and operation. How common is it for writers, who affect to be comic, when in want of other means for raising a smile, to use affected alliteration with success. But, in the fine arts, no beauty nor grace is beyond the power of ridicule. The noblest attitudes in painting have been rendered laughable by caricature. St Paul preaching at Athens, in the design of Raphael, appears elegant, noble, and in some degree awful. The same apostle, represented by Hogarth in nearly the same attitude, pleading before the governor Felix, seems altogether ridiculous. So the language and versification of Milton in the Paradise Lost appear only proper for the most elevated subjects. In the Splendid Shilling of Philips, they appear equally proper for the lowest. So fares it also with alliteration. Nor ought we to be mortified at the discovery, that much of the delight afforded by versification arises from a cause so pitiful as the repetition of the same letter twice, or oftener, on the accented parts of a verse; for there are many other causes of pleasure, which, when thus detected and taken to pieces, seem equally contemptible.

We apprehend the principal operation of this ornament to be quite mechanical. It is easier for the organs of speech to resume, at short intervals, one certain conformation, than to throw themselves into a number of different ones, unconnected and discordant. For example, a succession of labials, interspersed at regular distances with dentals and gutturals, will be more easily pronounced than the succession of all the three at random. Sounds of which the articulation is easiest, are most completely in the power of the speaker. He can pronounce them slowly or rapidly, softly or with force, at pleasure. In this we imagine the power and advantage of alliteration is founded: for we would not lay any stress on the pleasure which can result to the ear from the repetition of the same letter. It has been compared to the frequent returns of the key-note in a musical strain; but that analogy is extremely faint. The ear, we presume, can be pleased with alliteration only in so far as it contributes to the superior easiness of recitation; for what is recited with ease must be heard with pleasure.

These remarks might be confirmed and illustrated by numberless passages from the best poets. Some few lines will suffice, taken from Grey, who seems to have paid particular attention to this grace. He professed to have learned his versification from Dryden, as Dryden did from Spencer; and these three abound in alliteration above all the English poets. We choose Grey for another reason, in proof of what we mentioned before, that alliteration contributes not only to the sweetness, but also to the energy, of versification; for he uses it chiefly when he aims at strength and boldness. In the *Sister Odes* (as Dr Johnson styles them), almost every strophe commences and concludes with an alliterative line. The poet, we suppose, wished to begin with force, and end with dignity.

“Ruin seize thee, ruthless king.”

“To high-born Hoel’s harp, or soft Llewellyn’s lay.”

“Weave the warp, and weave the woof.”

“Stamp we our vengeance deep, and ratify his doom.”

3

“Regardless of the sweeping whirlwind’s sway.”

“That hush’d in grim repose, expects his evening prey.”

It must be observed here, that we hold a verse alliterative which has a letter repeated on its accented parts, although those parts do not begin words; the repeated letter bearing a strong analogy to the bars in a musical phrase. Gray seems to have had a particular liking to these sort of balanced verses, which divide equally, and of which the opposite sides have an alliterative resemblance.

“Eyes that glow, and fangs that grin,

“Thoughts that breathe, and words that burn.”

“Hauberk crash, and helmet ring.”

All these lines appear to us to have a force and energy, arising from alliteration, which renders them easy to be recited; or, if the reader pleases, *mouthed*. For the same reason the following passage appears sad and solemn, by the repetition of the labial liquid.

“Mountains, ye mourn in vain.”

“Modred, whose magic song,”—&c.

If alliteration thus contributes to enforce the expression of a poetical sentiment, its advantages in poetry must be considerable. It is not, therefore, unworthy a poet’s regard in the act of composition. If two words offer of equal propriety, the one alliterative the other not, we think the first ought to be chosen. We would compare this to the practice of fuguing in music. A composer who aims at expression will not hunt after fugues; but if they offer, if they seem to arise spontaneously from the subject, he will not reject them. So a good poet ought not to select an epithet merely for beginning with a certain letter, unless it suit his purpose well in every other respect; for the beauty of alliteration, when happy, is not greater than its deformity when affected. A couplet from Pope will exemplify both; the first line being bad, and the second good:

“Eternal beauties grace the shining scene,

“Fields ever fresh, and groves for ever green.”

ALLIUM (from *ἄλλω*, “to avoid or shun,” because many shun the smell of it), GARLIC: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking in the 9th order, *Spathaceæ*. The characters are: The *calix* is a common spathe, roundish, withering, and multiflorous; The *corolla* consists of six oblong petals: The *stamina* have six subulated filaments, often the length of the corolla; the antheræ are oblong and erect: The *pistillum* has a germen above, shorter, nearly three-cornered, with angles engraved with a line; the styli are simple, the stigmata acute: The *pericarpium* is a very short, broad, three-lobed capsule, with three cells and three valves: The *seeds* are many and roundish. Of this genus no fewer than 40 different species are enumerated by Linnæus, among which he includes the cepa and porrum, or onions and leeks.

1. The sativum, or garlic, has a bulbous root, of an irregularly roundish shape, with several fibres at the bottom; each root is composed of a number of lesser bulbs, called *cloves* of garlic, inclosed in one common

3 O 2

membranous

Alliteration,
Allium.

Allium. membranous coat, and easily separable from one another. All the parts of this plant, but more especially the roots, have an acrimonious, and almost caustic taste, with a strong offensive smell, which last has induced those who preserved some of the species in gardens on account of their yellow flowers, to eradicate them.

This pungent root warms and stimulates the solids, and attenuates tenacious juices; for which it is well adapted, on account of its being very penetrating; in so much that, when applied to the feet, its scent is soon discovered in the breath; and, when taken internally, its smell is communicated to the urine, or the matter of an issue, and perspires through the pores of the skin. Hence, in cold eucophlegmatic habits, it proves a powerful expectorant, diuretic, and emmenagogue; and, if the patient is kept warm, sudorific. It is also of great service in humoral asthmas and catarrhus disorders of the breast, and in other disorders proceeding from a laxity of the solids, and cold sluggish indispositions of the fluids. It is also frequently of service in the dropsy; in the beginning of which it is particularly recommended by Sydenham, as a warm strengthening medicine: we have even many examples where it acts so powerfully as a diuretic, as to carry off all the water of dropsies. It may be taken the length of a dram or two in substance for a dose.—We have a syrup and oxymel made with it, which may be employed for the same purposes as the garlic in substance; but they are mostly used in pulmonary disorders.—Externally applied, it inflames and ulcerates the skin, and is sometimes employed for this use in sinapisms. It has also been recommended by Sydenham as a most powerful revellent; for which purpose he was led to make use of it in the confluent small-pox. His method was to cut the root in pieces, and apply it, tied in a linen cloth, to the soles of the feet, about the eighth day of the disease, after the face began to swell; renewing it once a-day till the danger was over.—When made into an unguent with oils, and applied externally, garlic is said to resolve and discuss cold tumours, and has been by some greatly celebrated in cutaneous disorders.

The acrimonious qualities of this root, however, render it manifestly improper on many occasions. Its liberal use is apt to occasion head-achs, flatulencies, thirst, febrile heats, inflammatory distempers, and sometimes discharges of blood from the hemorrhoidal vessels. In hot bilious constitutions, where there is already a degree of irritation, where the juices are too thin and acrimonious, or the viscera unbound, it never fails to aggravate the distemper.

In Kamtschatka, the *allium ursinum*, or wild garlic, is very common and useful in medicine as well as food. Both Russians and natives gather it in great quantities for winter service. They steep it in water, then mix it with cabbage, onions, and other ingredients, and form out of them a ragout which they eat cold. It is also the principal remedy for the scurvy. As soon as this plant appears above the snow, they seem to put this dreadful disorder at defiance, and find a cure almost in its worst stages.

Garlic is very hardy, and will thrive in almost any soil or situation. It is easily propagated either by the roots or seeds. If from the roots, they ought to be planted in autumn, that they may take good root in the ground before the spring, which is necessary to make them flower strong the following sum-

mer. If they are propagated by seeds, they may be sown on a border of common earth, either in autumn soon after the seeds are ripe, or in the spring following; and will require no farther care than to keep them clear from weeds. In the following autumn, they may be transplanted into the borders where they are to remain.

2. The *ascalonicum*, or *eschalot*, was found wild in Palestine by Dr Hasselquist. The root is conglobate, consisting of many oblong roots bound together by thin membranes. Each of these small roots sends forth two or three fistulous, long, awl-shaped leaves, issuing from a sheath, and are nearly like those of the common onion. The flower-stem shoots from a membranaceous sheath; is round, almost naked, and terminated by a globular umbel of flowers, which have erect, purplish, lance-shaped petals, of the length of the stamina.—The root of this species is very pungent, has a strong, but not unpleasant smell, and therefore is generally preferred to the onion for making high-flavoured soups and gravies. It is also put into pickles, and in the East Indies they use an abundance of it for this purpose.

3. The *scorodoprasum*, or *rokambole*, grows naturally in Denmark and Sweden. It hath a heart-shaped solid root, which stands sidewise of the stalk. The leaves are broad, and are a little crenated on their edges. The flowers are of a pale purple colour, and collected into a globular head. The roots are used for the same purpose as the former.

4. The *schœnoprasum*, or *cives*, is an inhabitant of Siberia, and is a very small plant compared with the former, the leaves and stems seldom exceeding six inches in length, and the roots never producing any bulbs. The leaves are awl-shaped, hollow, and the stem naked. It was formerly in great request for mixing with salads in the spring, but has been little regarded lately. Its taste, smell, and virtues, are much the same as those of the common onion. It is propagated by parting the roots.

5. The *cepa*, or common onion, differs from the garlic only in the swelling pipy stalk, which is much larger in the middle than at either end.—From whence this was first brought into Europe is not known; but that it is not natural to Africa is beyond a doubt, it being evident that onions were eaten by the Egyptians above 2000 years before Christ; and they make a great part of their constant food to this day in Egypt. Dr Hasselquist says it is not to be wondered at that the Israelites should long for them after they had left this place; for whoever has tasted onions in Egypt must allow, that none can be had better in any part of the universe. Here, he observes, they are sweet, in other countries they are nauseous and strong. Here they are soft; whereas in the north and other parts they are hard, and their coats so compact that they are difficult to digest. They eat them roasted, cut into four pieces, with some bits of roasted meat, which the Turks call *kebab*; and with this dish they are so delighted, that they wish to enjoy it in paradise. They likewise make a soup of them in Egypt, which Hasselquist says is one of the best dishes he ever eat. The many ways of dressing onions in Britain are known to every family: but in regard to wholesomeness, there is certainly no method equal to boiling; as thus they are rendered mild, of easy digestion, and go off without leaving those heats in the stomach and bowels, which

Allium.

Allium,
Allix.

which they are apt to do any other way. Their nature is to attenuate thick, viscid juices; consequently a plentiful use of them in cold phlegmatic constitutions must prove beneficial. Many people shun them on account of the strong, disagreeable smell they communicate to the breath. This may be remedied by eating a few raw parsley leaves immediately after, which will effectually overcome the scent of the onions, and cause them to fit more easy on the stomach.

The varieties are, the Strasburgh, the Spanish, and the Egyptian onion. They are propagated by seeds, which should be sown the latter end of February, or the beginning of March, on good, light, rich ground, well dug and levelled, and cleared from weeds. They should also be sown at a time when the surface of the ground is not moist; and where they are intended for a winter crop, they must not be sown too thick. The common allowance is six pounds of seed to an acre; though some allow more, in order to have a crop to draw out, which they call *cullings*. In about six weeks after, the onions will be up and forward enough to hoe; at which time the weeds should be lightly cut up with a small hoe about two inches and a half broad, as also the onions themselves where they grow too close in bunches, leaving them at this first time at least two or three inches apart. This, if properly performed, and in a dry season, will preserve the ground clear of weeds at least a month, when they must be hoed over again, leaving them at this time about four or five inches asunder. In six weeks after they must be hoed a third time. The weeds are now to be carefully cut up, and the onions singled out so as to leave them about six inches square; by which means they will grow much larger than if left too close. This, if well performed, in case the weather proves dry, will keep the onions till they are fit to pull: but if the weather should prove moist, and any of the weeds take root again, the weeds must be pulled out with the hand; for the onions having now begun to bulb, must not be disturbed with a hoe. Towards the middle of August the onions will have arrived at their full growth, which may be known by their blades falling to the ground and shrinking. At this time, therefore, before their necks or blades are withered off, they should be drawn out of the ground, the extreme part of the blade cut off, and the onions laid upon a dry spot of ground, observing to turn them every other day at least, to prevent them from taking root again; which in moist weather they would be apt to do. At any rate, they are very apt to grow in the lofts where they are kept all winter; the most effectual method of preventing which is, with a hot iron, slightly to touch their beards or roots, which will effectually prevent their sprouting; but in doing this, great caution must be used not to scorch the pulp, for that will cause them to perish soon after. In order to save seeds, you must in the spring make choice of some of the largest, firmest, and best shapen onions (in quantity proportionable to the seed you intend to save), and having prepared a piece of good ground, which should be well dug, and laid out in beds about three feet wide, the onions must be planted in the beginning of March in the following manner: Having strained a line of about four inches within the side of the bed, you must with a spade throw out an opening six inches deep, the length of

the bed, into which you should place the onions with their roots downward, at about nine inches distance from each other; and with a rake draw the earth into the opening again to cover the bulbs; then proceed to remove the line again about a foot farther back, where you must make an opening as before, and so again, till the whole is finished, by which you will have four rows in each bed; between each bed you must allow the space of two feet for an alley to go among them. In a month's time the leaves will appear above ground, and many of the roots will produce three or four stalks each. About the beginning of June, when the flowers begin to appear, the stalks must be tied to stakes to prevent them from being broke by their own weight. About the end of August the seed will be ripe; which may be known by the opening of the cells which contain it, and its changing to a brown colour. When the heads are cut off, they should be spread abroad upon coarse cloths in the sun, observing to keep it under shelter in the night, as also in wet weather. When the heads are quite dry, the seeds should be beat out from them; and after being cleared from the husks, and exposed one day to the sun to dry, they may be put up in bags for use.

Besides the above-mentioned sorts of onions, the scallions or escallions, and Welsh onions, were formerly in great repute. The former is a sort which never forms any bulbs at the roots, and was chiefly used in the spring for green onions; but is now become so scarce as hardly to be known. Some gardeners, instead of the scallion, substitute such onions as decay and sprout in the house. These they plant in a bed early in the spring, and in a short time they become large enough for use. The true scallion is easily propagated by parting the roots either in spring or autumn; but the latter is preferable. The roots should be planted three or four in a hole, and about six inches distance every way.—The Welsh onions are propagated only for spring use; they never make any bulbs, and are therefore fit only to be used green for salads. They are sown in the end of July, in beds about three feet and a half wide. In a fortnight's time they appear above ground; but in October their blades die, and the ground becomes quite naked. In January, however, they will again appear very strong, and in March will be fit to draw for young onions.

6. The porrum, or leek, has been so long cultivated, that its native place of growth cannot be traced. It is undoubtedly the same as that mentioned in the eleventh Chap. of Numbers, where it is said the Israelites longed for leeks in conjunction with onions. The leaves are much of the same nature as those of the latter, and they are yet a constant dish at the tables of the Egyptians, who chop them small and then eat them with their meat. They are in great esteem, too, with the Welsh, and their general use as a pot-herb is well known.—Their culture is the same with that of the onion.

ALLIX (Dr Peter), a learned French Protestant divine, born at Alencon in 1641. He became minister of the reformed church at Rouen, where he published many learned and curious pieces; the credit of which induced the reformed to call him to Charenton, about a league from Paris, being the principal church

they

Alloa.

they had in France. On the revocation of the edict of Nantz, he retired to England; where he studied the language with so much success, as to publish a work, intitled *Reflections on the Books in the Holy Scriptures, to establish the Truth of the Christian Religion*, 2 vols; which he dedicated to James II. acknowledging his obligations to that prince, and his kind behaviour to the distressed refugees in general. He wrote several other treatises relating to ecclesiastical history; which rendered him as famous in England as in France, for his ingenious and solid defences of the reformed religion. He was complimented with the degree of D.D. and in 1699 was made treasurer of the church of Salisbury. He died in 1717.

ALLOA, or ALLOWAY, a sea-port town in Scotland, seated on the Forth, about 20 miles higher up the river than Leith, and five miles east of Stirling. It is a populous place; has two market-days in the week; and is remarkable for its fine castle the seat of the Earl of Mar, and for the coal-mines near it. The harbour is extremely commodious, with great depth of water; and vessels are expeditiously loaded with coals from the pits by an uncommon waggon-way, on which one horse draws with ease three waggons at once, each waggon containing a tun and a half. An excellent dry-dock has also been lately erected here, capable of receiving ships of the greatest burden. There is likewise a large glass-house for blowing bottles, of which vessels are supplied with any quantity upon the shortest notice.

The tower and lands of Alloa were exchanged by David II. king of Scots, anno 1365, with Thomas Lord Erskine, for the lands and estate of Strathgartney in Perthshire; and since that time the castle of Alloa has been the favourite residence of the family of Mar. The situation is uncommonly beautiful. The gardens here were the first that were laid out on a great scale in Scotland; and, with the advice of Le Naute, were indebted to the taste of John the late Earl of Mar, who began to plant them in the year 1706. They contain about 40 acres; and would have exhibited to Dr Johnson, had he travelled that way, as fine timber of fourscore years growth as his favourite England can produce.

The tower of Alloa is 89 feet in height, with walls of 11 feet in thickness; and was built in the end of the 13th century. In this residence of the family of Erskine many of the Scottish princes received their education, having been for more than two centuries the wards of the Lords Erskine and Earls of Mar; who held generally the castle of Stirling, and frequently the three principal fortresses of the kingdom, Edinburgh, Stirling, and Dunbarton. The last heir of the Scottish monarchy who was nurtured there was Henry Prince of Wales; whose cradle, golf-clubs, and other infantine and youthful remains, are preserved by the heir of the Earls of Mar, in remembrance of that spirited and promising prince; of whom Dr Birch has preserved several anecdotes, connected with the Erskines and his residence at Alloa.—Among other remains of antiquity preserved at Alloa, in remembrance of the confidence and affection which subsisted always betwixt the Stuarts and the Erskines, is the private signet of the unfortunate Mary, which she gave to the regent Mar, after she was obliged by the treaty of Edinburgh

to desist from wearing the arms of England in the first quarter; the child's-chair of James VI. her son; and the festive-chair of Thomas Lord Erskine the second Earl of Mar of the name, with the fashionable grace carved on it, *Soli Deo Honor et Gloria*.

ALLOBROGES (Inscriptions, Livy, Velleius, Flarus); from *Allobrox* (Horace): a people of Gallia Narbonensis, situated between the rivers Isara and Rhodanus, and the Lacus Lemanus; commended by Cicero for their fidelity, discommended by Horace on account of their fondness for novelty.

ALLOCATION denotes the admitting or allowing of an article of an account, especially in the exchequer. Hence,

ALLOCATIONE Facienda, is a writ directed to the lord treasurer, or barons of the exchequer, commanding them to allow an accountant such sums as he has lawfully expended in the execution of his office.

ALLOCUTIO, an oration or speech of a general addressed to his soldiers, to animate them to fight, to appease sedition, or to keep them to their duty. A mound of earth was raised upon the occasion, as it were a kind of tribunal of turf. From this the general pronounced his harangue to the army, which was ranged in several squadrons round him, with their captains at their head. When the time and circumstances would not admit of a formal harangue, the general went through the ranks, and called each by his name, putting them in mind of their courage upon former occasions, mentioning the victories they had won, and making promises of plunder.

ALLODIUM, or ALLEUD, denotes lands which are the absolute property of their owner, without being obliged to pay any service or acknowledgment whatever to a superior lord. See FEE and *FEDAL System*.

ALLOPHYLLUS, in botany; a genus of the monogynia order, belonging to the octandria class of plants. The characters of which are: The calyx is a four-leaved perianthium, with orbicular leaflets, the opposite ones less: The corolla consists of four orbicular equal petals, less than the calyx; the claws broader, the length of the smaller leaves of the calyx: The stamina consist of eight slender filaments, the length of the corolla; the antheræ are roundish: The pistillum has a round didymous germen above; the stylus is filiform, and longer than the stamina; and the stigma is bifid, with revolute divisions. There is but one species, the zeylanicus, a native of Ceylon.

ALLOTTING, or *ALLOTMENT*, of Goods, in matters of commerce, is when a ship's cargo is divided into several parts, bought by divers persons, whose names are written on as many pieces of paper, which are applied by an indifferent person to the several lots or parcels; by which means the goods are divided without partiality, every man having the parcel which the lot with his name on is appropriated.

ALLOY, or ALLAY, properly signifies a proportion of a baser metal mixed with a finer one. The alloy of gold is estimated by carats, that of silver by pennyweights. (See GOLD, &c.) In different nations, different proportions of alloy are used; whence their moneys are said to be of different degrees of fineness or baseness, and are valued accordingly in foreign exchanges.—The chief reasons alleged for the alloying of

Allobroges
||
Alloy.

Allum
||
Almadie

Almagest
||
Almanack.

of coin are: 1. The mixture of the metals, which, when smelted from the mine, are not perfectly pure. 2. The saving the expence it must otherwise cost if they were to be refined. 3. The necessity of rendering them harder, by mixing some parts of other metals with them, to prevent the diminution of weight by wearing in passing from hand to hand. 4. The melting of foreign gold or coin which is alloyed. 5. The charges of coinage, which must be made good by the profit arising from the money coined. 6. and lastly, The duty belonging to the sovereign, on account of the power he has to cause money to be coined in his dominions.

In a more general sense, the word is employed in chemistry to signify the union of different metallic matters.—As an infinity of different combinations may be made according to the nature, the number, and the proportions of the metallic matters capable of being alloyed, we shall not here enter into the detail of the particular alloys, all which are not yet nearly known. Those which are used, as *Bronze, Tombac, Brass, White Copper, &c.* may be found under their particular names; and what is known concerning other alloys may be found under the names of the different metals and semi-metals.

ALLUM. See ALUM.

ALLUMINOR, from the French *alumer*, “to lighten,” is used for one who coloureth or painteth upon paper or parchment; and the reason is, because he gives light and ornament by his colours to the letters or other figures. Such ornaments are styled *illuminations*. The word is used in stat. 1. R. III. cap. 9. But now such a person is called a *limner*.

ALLUSH, (anc. geog.) The Israelites being in the wilderness of Shur, departed from Dophkah, and went to Allush, from whence they proceeded to Rephidim; Num. xxxiii. 13, 14. Eusebius and St Jerom fix Allush in Idumæa, about Gabala or Petra, the capital of Arabia Petræa. In the accounts of the empire, it is situated in the third Palestine; and by Ptolemy, among the cities of Idumæa.

ALLUSION, in rhetoric, a figure by which something is applied to, or understood of, another, on account of some similitude between them.

ALLUVION, in law, denotes the gradual increase of land along the sea-shore, or on banks of rivers.

ALLY, in matters of polity, a sovereign prince or state that has entered into alliance with others. See ALLIANCE.

ALMACANTARS. See ALMUCANTARS.

ALMACARRON, a sea-port town of Spain, in the province of Murcia, at the mouth of the river Guadalantín. It is about twenty miles west of Carthagena, and is remarkable for the prodigious quantity of alum found in its territory. W. Long. 1. 15. N. Lat. 37. 40.

ALMADE, a town of Spain, in the province of La Mancha, in the kingdom of Castile, situated upon the top of a mountain, where are the most ancient as well as the richest silver mines in Europe.

ALMADIE, a kind of canoe, or small vessel, about four fathoms long, commonly made of bark, and used by the negroes of Africa.

ALMADIE is also the name of a kind of long-boats, fitted out at Calicut, which are eighty feet in length,

and six or seven in breadth. They are exceedingly swift, and are otherwise called *catburi*.

ALMAGEST, in matters of literature, is particularly used for a collection or book composed by Ptolemy, containing various problems of the ancients both in geometry and astronomy.

ALMAGEST is also the title of other collections of this kind. Thus, Riccioli has published a book of astronomy, which he calls the *New Almagest*; and Plukenet, a book which he calls *Almagestrum Botanicum*.

ALMAGRA, a fine deep red ochre, with some admixture of purple, very heavy, and of a dense yet friable structure, and rough dusty surface. It adheres very firmly to the tongue, melts freely and easily in the mouth, is of an austere and strongly astringent taste, and stains the skin in touching. It is the *Sil Atticum* of the ancients: it ferments very violently with acid menstruums; by which single quality, it is sufficiently distinguished from the *Sil Syricum*, to which it has in many respects a great affinity. It is found in immense quantities in many parts of Spain; and in Andalusia there are in a manner whole mountains of it. It is used in painting, and in medicine as an astringent.

ALMAGRO, a fortress of Spain, the capital of one of the districts of La Mancha. It was built by the archbishop Roderic of Toledo, who finished it in 1214, and put a considerable garrison into it to restrain the incursions of the Moors. This was hardly done, when the fortress was besieged by an army of 5000 horse and foot, under the command of a Moorish officer of great reputation; but the prelate, its founder, took care to supply those within with such plenty of necessaries, that at length the enemy found themselves obliged to raise the siege and retire with great loss.

ALMANACK, a book, or table, containing a calendar of days and months, the rising and setting of the sun, the age of the moon, the eclipses of both luminaries, &c.—Authors are divided with regard to the etymology of the word; some deriving it from the Arabic particle *al*, and *manack*, to count; some from *al-manah*, new-year's gifts, because the Arabian astrologers used at the beginning of the year to make presents of their ephemerides; and others, from the Teutonic *alman-achte*, observations on all the months. Mr Johnson derives it from the Arabic particle *al*, and the Greek $\mu\upsilon\upsilon$, a month. But the most simple etymology appears from the common spelling; the word being composed of two Arabic ones, *Al Manack*, which signify the *Diary*. All the classes of Arabs are commonly much given to the study of astronomy and astrology; to both which a pastoral life, and a sort of husbandry, not only incline them, but give them time and leisure to apply themselves to them: They neither sow, reap, plant, travel, buy or sell, or undertake any expedition or matter, without previously consulting the stars, or, in other words, their almanacks, or some of the makers of them. From these people, by their vicinity to Europe, this art, no less useful in one sense than stupid and ridiculous in another, hath passed over hither: and those astronomical compositions have still every where not only retained their old Arabic name; but were, like theirs, for a long while, and still are among many European nations, interspersed with a great number of astrological rules for planting, sowing, bleeding, purging, &c. down to the cutting of the hair and paring

Almanack. of the nails.—Regiomontanus appears to have been the first in Europe, however, who reduced almanacks into their present form and method, gave the characters of each year and month, foretold the eclipses and other phases, calculated the motions of the planets, &c. His first almanack was first published in 1474.

Almanacks differ from one another, chiefly, in containing some more, others fewer, particulars.

The essential part is the calendar of months and days, with the risings and settings of the sun, age of the moon, &c. To these are added various parerga, astronomical, meteorological, chronological, political, rural, &c. as calculations and accounts of eclipses, solar ingresses, prognostics of the weather, tables of the tides, terms, &c. lists of posts, offices, dignities, public institutions, with many other articles political as well as local, and differing in different countries.—A great variety are annually published in Britain; some for binding, which may be denominated *book-almanacks*; others in loose papers, called *sheet-almanacks*.

The modern almanack answers to the *Fasti* of the ancient Romans. See **FASTI**.

Construction of ALMANACKS. The first thing to be done is, to compute the sun's and moon's place for each day of the year, or it may be taken from some ephemerides and entered into the almanack; next, find the dominical letter, and, by means thereof, distribute the calendar into weeks; then, having computed the time of easter, by it fix the other moveable feasts; adding the immoveable ones, with the names of the martyrs, the rising and setting of each luminary, the length of day and night, the aspects of the planets, the phases of the moon, and the sun's entrance into the cardinal points of the ecliptic, *i. e.* the two equinoxes and solstices. (See **ASTRONOMY**, *passim*.) By the help of good astronomical tables or ephemerides, the construction of almanacks is extremely easy.

Almanacks for one year printed on one side of paper, pay of duty 4d.; those for more years pay for three years 1d.; but perpetual almanacks are to pay only for three years at 2d. Out of the duties by this act there shall be paid to each university L. 500 *per ann.* half yearly, at Midsummer and Christmas, and the surplus shall be paid into the exchequer to go to the sinking fund. Selling unstamped almanacks incurs the same penalty as for selling unstamped newspapers. Almanacks in bibles and common prayer books are exempted.

ALMANACK, among antiquaries, is also the name given to a kind of instrument, usually of wood, inscribed with various figures and Runic characters, and representing the order of the feasts, dominical letters, days of the week, and golden number, with other matters necessary to be known throughout the year; used by the ancient northern nations, in their computations of time, both civil and ecclesiastical. Almanacks of this kind are known by various names, among the different nations wherein they have been used; as *rim-stocks*, *primstaries*, *runstocks*, *runstuffs*, *Scipiones Runic*, *Bacculi Annales*, *clogs*, &c. They appear to have been used only by the Swedes, Danes, and Norwegians. From the second of these people, their use was introduced into England, whence divers remains of them in the counties. Dr Plot has given the description and figure of one of these clogs, found in

N^o 12.

Staffordshire, under the title of *The perpetual Staffordshire Almanack*. The external figure and matter of these calendars appear to have been various. Sometimes they were cut on one or more wooden leaves, bound together after the manner of books; sometimes on the scabbards of swords, or even on daggers; sometimes on tools and implements, as portable steelyards, hammers, the helms of hatchets, nails, &c. Sometimes they were made of brass or horn; sometimes of the skins of eels, which, being drawn over a stick properly inscribed, retained the impressions of it. But the most usual form was that of walking-staves, or sticks, which they carried about with them to church, market, &c. Each of these staves is divided into three regions; whereof the first indicates the signs, the second the days of the week and year, and the third the golden number. The characters engraven on them are, in some, the ancient Runic; in others, the later Gothic characters of Ulfilus. The saints days are expressed in hieroglyphics, significative either of some endowment of the saint, the manner of his martyrdom, or the like. Thus, against the notch for the first of March, or St David's day, is represented a harp; against the 25th of October, or Crispin's day, a pair of shoes; against the 10th of August, or St Lawrence's day, a gridiron; and, lastly, against New-year's day, a horn, the mark of good drinking, which our ancestors gave a loose to at that season.

ALMANZA, a little town of New-Castile, on the frontiers of the kingdom of Valencia in Spain, situated in W. Long. 1. 19. N. Lat. 38. 54. It is remarkable for the defeat of the allies in 1707, under the Marquis de las Minas and the Earl of Galway. In the beginning of this action, the English troops penetrated thro' the centre of the Spanish army; but the Portuguese cavalry being broken by the Spanish, and the French infantry making a dreadful fire on their flanks, the allied army was at last broken, and began their retreat when it was almost dark. Colonel Hill carried off the remains of thirteen battalions towards the river Xucar, which, if they could have passed, they might have been safe: but being very much fatigued, they were obliged to halt; by which means they were surrounded, and forced to surrender prisoners of war. In this battle, the allies lost 120 standards, together with all their artillery and baggage; a great number were killed, and several thousands taken prisoners. The Marquis de las Minas was dangerously wounded; and his mistress, in the garb of an amazon, killed by his side. The earl of Galway had two cuts cross the face, which, though not dangerous, had prevented him from seeing, or giving orders properly.

HERESY OF ALMARIC, a tenet broached in France by one Almaric, in the year 1209. It consisted in affirming, that every Christian was actually a member of Christ; and that without this faith no one could be saved. His followers went farther, and affirmed, that the power of the Father lasted only during the continuance of the Mosaic law; that the coming of Christ introduced a new law; that at the end of this began the reign of the Holy Ghost; and that now confession and the sacraments were at an end, and that every one is to be saved by the internal operations of the Holy Spirit alone, without any external act of religion.—Their morals were as infamous as their doctrine

Almanza,
Heresy of
Almaric.

Alme. was absurd. Their tenets were condemned by a public decree of the council of Sens, in the year 1209.

ALME, or ALMA, singing and dancing girls in Egypt, who, like the Italian *Improvvisatori*, can occasionally pour forth "unpremeditated verse." They are called *Almé*, from having received a better education than other women. They form a celebrated society in this country. To be received into it, according to Mr Savary, it is necessary to have a good voice, to understand the language well, to know the rules of poetry, and be able to compose and sing couplets on the spot, adapted to the circumstances. The *Almé* know by heart all the new songs. Their memory is furnished with the most beautiful tales. There is no festival without them; no entertainment of which they do not constitute the ornament. They are placed in a rostrum, from whence they sing during the repast. They then descend into the saloon, and form dances which have no resemblance to ours. They are pantomime ballets, in which they represent the usual occurrences of life. The mysteries of love too, generally furnish them with scenes. The suppleness of their bodies is inconceivable. One is astonished at the mobility of their features, to which they give at pleasure the impression suited to the characters they play. The indecency of their attitudes is often carried to excess. Their looks, their gestures, every thing speaks, but in so expressive a manner, that it is impossible to mistake them. At the beginning of the dance, they lay aside with their veils the modesty of their sex. A long robe of very thin silk goes down to their heels, which is slightly fastened with a rich girdle. Long black hair, plaited and perfumed, is flowing on their shoulders. A shift, transparent as gauze, scarcely hides their bosom. As they put themselves in motion, the shapes, the contours of their bodies, seem to develop themselves successively. Their steps are regulated by the sound of the flute, of castanets, the tambour de basque, and cymbals, which accelerates or retards the measure. They are still further animated by words adapted to such scenes. They appear in a state of intoxication. They are the Bacchantes in a delirium. It is when they are at this point, that throwing off all reserve, they abandon themselves totally to the disorder of their senses; it is then that a people far from delicate, and who like nothing hidden, redouble their applauses. These *Almé* are sent for into all the harems. They teach the women the new airs; they amuse them with amorous tales, and recite in their presence poems, which are so much the more interesting, as they furnish a lively picture of their manners. They initiate them into the mysteries of their art; and teach them to contrive lascivious dances. These girls, who have a cultivated understanding, are very agreeable in conversation. They speak their language with purity. The habit of dedicating themselves to poetry renders the softest and most sonorous expressions familiar to them. They repeat with a great deal of grace. In singing, nature is their only guide. Sometimes two of them sing together, but always with the same voice. It is the same with an orchestra, where all the instruments playing in unison execute the same part.

The *Almé* assist at the marriage ceremonies, and march before the bride, playing on instruments. They make a figure likewise at funerals, and accompany the

Vol. I. Part II.

procession, singing sorrowful airs. They break forth into groans and lamentations, and give every sign of grief and despair. These women are paid very high, and seldom appear but amongst the grandees and rich men.

The common people have also their *Almé*. They are girls of the second class, who try to imitate the former; but they have neither their elegance, their graces, nor their knowledge. They are every where to be met with. The public places and the walks about Grand Cairo are full of them. As the populace require allusions still more strongly marked, decency will not permit the relation to what a pitch they carry the licentiousness of their gestures and attitudes.

ALMEDIA, a frontier-town of Portugal, in the province of Tralos Montes, on the confines of Leon, where there was a very brisk action between the French and Portuguese in 1663; 17 miles N. W. of Ciudad Rodrigo. W. Long, 7. 10. N. Lat. 40. 41.

ALMEHRAB, in the Mahometan customs, a nich in their mosques, pointing towards the kebla or temple of Mecca, to which they are obliged to bow in praying. See *KEBLA*.

ALMEISAR, a celebrated game among the ancient Arabs, performed by a kind of casting of lots with arrows, strictly forbid by the law of Mahomet, on account of the frequent quarrels occasioned by it.

The manner of the game was thus: A young camel being brought and killed, was divided into a number of parts. The adventurers, to the number of seven, being met, 11 arrows were provided without heads or feathers; seven of which were marked, the first with one notch, the second with two, the third with three, &c. the other four had no marks. These arrows were put promiscuously into a bag, and thus drawn by an indifferent person. Those to whom the marked arrows fell, won shares in proportion to their lot; the rest to whom the blanks fell, were intitled to no part of the camel, but obliged to pay the whole price of it. Even the winners tasted not of the flesh themselves more than the losers, but the whole was distributed to the poor.

ALMENE, in commerce, a weight of two pounds used to weigh saffron in several parts of the continent of the E. Indies.

ALMERIA, a sea-port town in the kingdom of Granada in Spain, pleasantly situated in a fine bay at the mouth of the river Almeria, on the Mediterranean: W. Long. 3. 20. N. Lat. 36. 51. This town is by some thought to have risen upon the ruins of the ancient Abdera, and was formerly a place of great consequence. It was taken from the Moors in 1147, by the emperor Conrad III. in conjunction with the French, Genoese, and Pisans.—It was at that time the strongest place in Spain, held by the infidels; from which their privateers, which were exceedingly numerous, not only troubled the sea-coasts inhabited by the Christians, but gave equal disturbance to the maritime provinces of France, Italy, and the adjacent islands. The city being well fortified, having a strong castle, a numerous garrison, and being excellently provided with every thing necessary, made a vigorous resistance; but was at last taken by storm, when the victor put to the sword all the inhabitants who were found in arms, distributing the best part of the plunder among his al-

Almeria
||
Almoner.

lies, whom he sent away thoroughly satisfied. The Genoese, particularly, acquired here that emerald vessel which still remains in their treasury, and is deemed invaluable.

Upon its reduction by the Christians Almeria became a bishopric; but is at present very little better than a village, indifferently inhabited, and has nothing to testify so much as the probability of its former greatness, except certain circumstances which cannot be effaced even by the indolence of the Spaniards themselves. What these are, Udal ap Rhys, a Welshman, thus describes, in his tour through Spain and Portugal. "Its climate (says he) is so peculiarly blessed, that one really wants words to express its charms and excellence. Its fields and meads are covered with flowers all the year round; they are adorned also with palms, myrtles, plane-trees, oranges, and olives; and the mountains and promontories near it are as noted for their producing a great variety of precious stones, inasmuch that the next promontory to it is called the *Cape of Gates*, which is a corruption from the word *agates*, the hills thereabouts abounding in that sort of precious stones, as well as in emeralds and amethysts, granites or coarse rubies, and extreme curious alabaster in the mountains of Filaures."

ALMISSA, a small but strong town at the mouth of the Cetina, in Dalmatia, famous for its piracies; ten miles east of Spalatro. E. Long. 39. 33. N. Lat. 43. 56.

ALMOND, the fruit of the almond-tree. See AMYGDALUS.

ALMOND, in commerce, a measure by which the Portuguese sell their oil; 26 almonds make a pipe.

ALMONDS, in anatomy, a name sometimes given to two glands, generally called the *tonsils*.

ALMONDS, among lapidaries, signify pieces of rock-crystal, used in adorning branch-candlesticks, &c. on account of the resemblance they bear to the fruit of that name.

ALMOND-Furnace, among refiners, that in which the slags of litharge, left in refining silver, are reduced to lead again by the help of charcoal.

ALMONDBURY, a village in England, in the west-riding of Yorkshire, six miles from Halifax.

ALMONER, in its primitive sense, denotes an officer in religious houses, to whom belonged the management and distribution of the alms of the house. By the ancient canons, all monasteries were to spend at least a tenth part of their income in alms to the poor. The almoner of St Paul's is to dispose of the monies left for charity, according to the appointment of the donors, to bury the poor who die in the neighbourhood, and to breed up eight boys to singing, for the use of the choir. By an ancient canon, all bishops are required to keep almoners.

Lord ALMONER, or Lord High ALMONER, of England, is an ecclesiastical officer, generally a bishop, who has the forfeiture of all deodands, and the goods of *felos de se*, which he is to distribute among the poor. He has also, by virtue of an ancient custom, the power of giving the first dish from the king's table to whatever poor person he pleases, or, instead of it, an alms in money.

Great ALMONER, Grand ALMONIER, in France, is

the highest ecclesiastical dignity in that kingdom. To him belongs the superintendency of all hospitals and houses of lepers. The king receives the sacrament from his hand; and he says mass before the king in all grand ceremonies and solemnities.

ALMONER is also a more fashionable title given by some writers to chaplains. In this sense we meet with almoner of a ship, almoner of a regiment.

ALMONRY, or AUMBRY, the office or lodgings of the almoner; also the place where alms are given. See AMBRY.

ALMS, a general term for what is given out of charity to the poor.

In the early ages of Christianity, the alms of the charitable were divided into four parts; one of which was allotted to the bishop, another to the priests, and a third to the deacons and subdeacons, which made their whole subsistence; the fourth part was employed in relieving the poor, and in repairing the churches.

No religious system is more frequent or warm in its exhortations to alms-giving than the Mahometan. The Alcoran represents alms as a necessary means to make prayer be heard. Hence that saying of one of their khalifs: "Prayer carries us half-way to God, fasting brings us to the door of his palace, and alms introduces us into the presence-chamber." Hence many illustrious examples of this virtue among the Mahometans. Hafan, the son of Ali, and grandson of Mohammed, in particular, is related to have thrice in his life divided his substance equally between himself and the poor, and twice to have given away all he had. And the generality are so addicted to the doing of good, that they extend their charity even to brutes.

ALMS, also denotes lands or other effects left to churches or religious houses, on condition of praying for the soul of the donor. Hence,

Free ALMS was that which is liable to no rent or service.

Reasonable ALMS was a certain portion of the estates of intestate persons, allotted to the poor.

ALMS-Box, or Chest, a small chest, or coffer, called by the Greeks *Κιβωτιον*, wherein anciently the alms were collected, both at church and at private houses.

The alms-chest in English churches, is a strong box, with a hole in the upper part, having three keys, one to be kept by the parson or curate, the other two by the church-wardens. The erecting of such alms-chest in every church is enjoined by the book of canons, as also the manner of distributing what is thus collected among the poor of the parish.

ALMS-House, a petty kind of hospital, for the maintenance of a certain number of poor, aged, or disabled people.

ALMUCANTARS, in astronomy, an Arabic word denoting circles of the sphere passing through the centre of the sun, or a star, parallel to the horizon, being the same as PARALLELS of Altitude.

ALMUCANTARS-Staff, is an instrument usually made of pear-tree or box, having an arch of 15 degrees; used to take observations of the sun, about the time of its rising and setting; in order to find the amplitude, and consequently the variation of the compass.

ALMUCIUM, denotes a kind of cover for the head, worn chiefly by monks and ecclesiastics: It was of a square

Almoner
||
Almucium.

Almugim
||
Alawick.

square form, and seems to have given rise to the bonnets of the same shape still retained in universities and cathedrals.

ALMUGIM, or ALMUG-TREE, a certain kind of wood mentioned in the first book of Kings, (x. 11.) which the vulgate translates *ligna thyina*, and the Septuagint *wrought wood*. The Rabbin generally render it *coral*; others, *ebony*, *brazil*, or *pine*. But it is observed, that the almug-tree can by no means be coral, because that wood is not fit for the purposes that the Scripture tells us the almug-tree was used, such as musical instruments, stair-cases, &c. The word *thyinum* is a name for the citron-tree, known to the ancients, and very much esteemed for its sweet odour and great beauty. It came from Mauritania. The almug-tree, or almugim, algumim, or simply gummim, taking *al* for a kind of article, is therefore by the best commentators understood to be an oily and gummy sort of wood; and particularly that sort of tree which produces the gum ammoniac, which is also thought to be the same with the shittim-wood, whereof there is such frequent mention made by Moses.

ALMUNECAR, a sea-port town in the kingdom of Granada, seated on the Mediterranean, with a good harbour, defended by a strong castle, 20 miles south of Alhama. W. Long. 3. 45. N. Lat. 36. 50.

ALNAGE, or AULNAGE, the measuring of woollen manufactures with an ell. It was at first intended as a proof of the goodness of that commodity, and accordingly a seal was invented as a mark that the commodity was made according to the statute; but, it being now possible to purchase these seals, they are affixed, whenever the vender pleases, to all cloaths indiscriminately, to the great prejudice of our woollen manufactures.

ALNAGER, ALNEGER, or AULNEGER, q. d. *measurer by the ell*; signifies a sworn public officer, who by himself, or deputy, is to look to the affize of woollen cloth made throughout the land, i. e. the length, width, and work thereof; and to the seals for that purpose ordained. The office of king's aulnager seems to have been derived from the statute of Richard I. A. D. 1197, which ordained, that there should be only one weight and one measure throughout the kingdom; and that the custody of the affize, or standard of weights and measures, should be committed to certain persons in every city and borough. His business was, for a certain fee, to measure all cloths made for sale, till the office was abolished by the statute 11 and 12 W. III. cap. 20.

ALNUS, the ALDER-TREE, a species of betula. See BETULA.

ALNUS, in the ancient theatres, that part which was most distant from the stage.

ALNWICK, a thoroughfare town in Northumberland, on the road to Scotland. Here Malcolm, king of Scotland, making an inroad into Northumberland, was killed, with Edward his son, and his army defeated by Robert Mowbray, earl of this county, anno 1092. Likewise William, king of Scotland, in 1174, invading England with an army of 80,000 men, was here encountered, his army routed, and himself made prisoner. The town is populous, and in general well built; it has a large town-house, where the quarter-sessions and county-courts are held, and members of

parliament elected. It has a spacious square, in which a market is held every Saturday. Alnwick appears to have been formerly fortified, by the vestiges of a wall still visible in many parts, and three gates which remain almost entire. It is governed by four chamberlains, who are chosen once in two years out of a common council, consisting of 24 members. It is ornamented by a stately old Gothic castle, which has been the seat of the noble family of Piercy, earls of Northumberland. As the audits for receipt of rents have ever been in this castle, it has always been kept in tolerable repair; and not many years ago, it was repaired and beautified by the duke of Northumberland, who made very considerable alterations, upon a most elegant plan, with a view to reside in it some part of the summer-season. The manner of making freemen is peculiar to this place, and indeed is as ridiculous as singular. The persons who are to be made free, or, as the phrase is, leap the well, assemble in the market-place, very early in the morning, on the 25th of April, being St Mark's day. They appear on horse-back, with every man his sword by his side, dressed in white, and with white night-caps, attended by the four chamberlains and the castle-bailiff, mounted and armed in the same manner; from hence they proceed, with music playing before them, to a large dirty pool, called *Freeman's-well*, where they dismount, and draw up in a body, at some distance from the water; and then rush into it all at once, and scramble through the mud as fast as they can. As the water is generally very foul, they come out in a dirty condition; but taking a dram, they put on dry clothes, remount their horses, and ride full gallop round the confines of the district; then re-enter the town, sword in hand, and are met by women dressed in ribbons with bells and garlands, dancing and singing. These are called *timber-waifs*. The houses of the new freemen are on this day distinguished by a great holly-bush, as a signal for their friends to assemble and make merry with them after their return. This ceremony is owing to king John, who was mired in this well; and who, as a punishment for not mending the road, made this a part of their charter. Alnwick is 310 miles north by west from London, 33 north of Newcastle, and 29 south of Berwick. Long. 1. 10. Lat. 55. 24.

ALOA, in Grecian antiquity, a festival kept in honour of Ceres by the husbandmen, and supposed to resemble our harvest-home.

ALOE, in botany, a genus of the monogynia order, belonging to the hexandria class of plants; and, in the natural method, ranking under the 10th order, *Coronariæ*. The characters are: There is no *calyx*: The *corolla* is monopetalous, erect, six-cleft, and oblong; the tube gibbous; the border spreading, and small; with a nectary-bearing bottom: The *stamina* consist of six subulated filaments, rather surpassing the corolla in length, and inserted into the receptacle; the antheræ are oblong and incumbent: The *pistillum* has an ovate germen; the stylus is simple, the length of the stamina; the stigma is obtuse and trisid: The *pericarpium* is an oblong capsule, three-furrowed, three-celled, three-valved: The *seeds* are many and angular. Of this genus, botanical writers enumerate ten species; of which the most remarkable are,

1. The disticha, by some called the *soap aloe*, by others

Alnwick
||
Aloe.

Aloe.

others *caballine aloe*. This seldom rises above two feet high. The leaves are very broad at the base, where they closely embrace the stalk, and gradually decrease to a point. The edges are set with sharp spines, and the under leaves spread open horizontally every way. These are of a dark green colour spotted with white, somewhat resembling the colour of soft soap, from whence the plant got the name of *soap-aloe*. The flowers grow in umbels on the tops of the stalks, are of a beautiful red colour, and appear in August and September. 2. The *variegata*, or partridge-breast aloe, is a low plant, seldom rising above eight inches high. The leaves of this are triangular, and curiously veined and spotted, somewhat like the feathers of a partridge's breast. The flowers grow in very loose spikes, and are of a fine red colour tipped with green. 3. The *viscosa*, with funnel-shaped flowers, grows near a foot high, with triangular leaves of a dark green colour. The flowers grow thinly upon very slender footstalks, are of an herbaceous colour, and their upper part turns backward. 4. The *spiralis*, with oval crenated flowers, grows somewhat like the former; only the flowers grow upon taller stalks, which branch out and grow in very long close spikes. 5. The *linguisformæ*, or tongue-aloe, has its leaves about six inches in length, and shaped like a tongue. The flowers grow in slender loose spikes, each hanging downward, of a red colour below, and green at the top. 6. The *margaritifera*, or pearl aloe, is a very beautiful plant. It is smaller than most of the aloe kind. The leaves are short, very thick, sharp pointed, and turning down, with a large thick end, appear there triangular. The colour of the leaves is a fine green, striped in an elegant manner with white, and frequently tipped with red at the point. The flower-stalk, which rises in the midst of the leaves, is round, smooth, of a purple colour, and generally about eight inches high. When the plant has been properly cultivated, the flowers are striped with green and white; and sometimes they are entirely white. This aloe is singular in not having the bitter refinous juice with which the leaves of most others abound; when a leaf of this species is cut, what runs from it is watery, colourless, and perfectly insipid. 7. The *perfoliata*, or ficatorine aloe, hath long, narrow, succulent leaves, which come out without any order, and form large heads. The stalks grow three or four feet high; and have two, three, and sometimes four, of these heads branching out from it. The flowers grow in long spikes, each standing on a pretty long footstalk; they are of a bright red colour tipped with green, and generally appear in the winter season. 8. The *retusa*, or cushion aloe, hath very short, thick, succulent leaves, compressed on the upper side like a cushion. This grows very close to the ground; the flowers grow on slender stalks, and are of an herbaceous colour.

Culture. The proper earth for planting these vegetables in, is, one half fresh light earth from a common, and the rest an equal mixture of white sea-sand and sifted lime-rubbish. This mixture should be always made six or eight months before the plants are to be set in it. The common aloe will live in a dry greenhouse in winter; and may be placed in the open air in summer, in a sheltered situation, but must have very little water. Most of the other aloes are best preserved

in an airy glass-case, in which there is a stove, to make a little fire in very bad weather. The tenderest kinds require a greater share of heat to preserve them in winter, and should be kept in a good stove, in a degree of heat ten degrees above temperate. Many other kinds may also be kept in this heat; but the greater the heat, the more water they always require. About the beginning of June, it is usual in England to set the pots of aloes out of the house: but they should be set under the shelter of hedges or trees, to keep them from the violence of the sun; the rains also, which usually fall in this and the following month, are apt to rot them. It is therefore best to keep them under cover the greatest part of the year. The best time to shift these plants is the middle of July. They are, on this occasion, to be taken out of the pots, the loose earth to be picked from about their roots, and the decayed or mouldy parts of them cut off; then a few stones are to be put at the bottom of the pot, and it is to be filled with the composition before described, and the plants carefully put in, the roots being so disposed as not to interfere with one another. They are to be carefully watered after this, at times, for three weeks, and set in a shady place. The common kind will bear the open air from May to October, and should be shifted every year. All the aloes are propagated by off-sets, or by planting the leaves. The off-sets should be taken from the mother plant, at the time when it is shifted: they are to be planted in very small pots of the proper mixed earth; and if that part of them which joined to the mother-plant be observed to be moist when taken off, it should lie on the ground in a shady place two or three days before it is planted, otherwise it will rot. After planting these, they should remain in a shady place a fortnight; and then be removed to a very moderate hot-bed, plunging the pots therein, which will help their striking new roots. Towards the end of August they must be, by degrees, hardened to the open air, by taking off the glasses of the hot-bed; and in September they may be removed into the green-house.

Properties, &c. The aloe is a kind of symbolic plant to the Mahometants, especially in Egypt, and in some measure dedicated to the offices of religion; for whoever returns from a pilgrimage to Mecca, hangs it over his street-door, as a token of his having performed that holy journey. The superstitious Egyptians believe that this plant hinders evil spirits and apparitions from entering the house; and on this account, whoever walks the streets in Cairo, will find it over the doors both of Christians and Jews. From the same plant the Egyptians distil a water, which is sold in the apothecaries shops at Cairo, and recommended in coughs, hysterics, and asthmas. An unexperienced French surgeon, says Hasselquist, gave a Coprite, 40 years old, afflicted with the jaundice, four tea-cups full of the distilled water of this species of aloe, and cured him in four days. This remedy, unknown to our apothecaries, is not difficult to be obtained, as the plant might easily be raised in the warm southern parts of Europe. The Arabians call it *sibbara*.

Of the leaves of the Guinea aloe, mentioned by Mr Adanson in his voyage to Senegal, the negroes make very good ropes, not apt to rot in the water.

Dr Sloane mentions two sorts of aloe; one of which

Aloe.

Aloc. is used for fishing-lines, bow-strings, stockings, and hammocks; the other has leaves which, like those of the wild-pine and banana, hold rain-water, and thereby afford a very necessary refreshment to travellers in hot countries, where there is generally a scarcity of wells and water.

In Mexico, the *magueli*, a species of aloe, yields almost every thing necessary to the life of the poor. Besides making excellent hedges for their fields, its trunk served in place of beams for the roofs of their houses, and its leaves instead of tiles. From those leaves they obtained paper, thread, needles, clothing, shoes, and stockings, and cordage; and from its copious juice they made wine, honey, sugar, and vinegar. Of the trunk, and thickest part of the leaves, when well baked, they made a very tolerable dish of food. Lastly, it was a powerful medicine in several disorders, and particularly in those of the urine. It is also at present one of the plants the most valued and most profitable to the Spaniards.

The medical substance known by the name of *aloes* is the inspissated juice of some of the abovementioned species. The ancients distinguished two sorts of aloes: the one was pure and of a yellowish colour, inclining to red, resembling the colour of a liver, and thence named *hepatic*; the other was full of impurities, and hence supposed to be only the dross of the better kind. At present, various sorts are met with in the shops; which are distinguished either from the places, from the species of the plants, or from some difference in the juices themselves. These may be all ranged in three classes:

1. *ALOE Perfoliata*, Socotorine aloes, brought from the island Socotora in the Indian ocean, wrapt in skins; it is obtained from the 15th species abovementioned.—This sort is the purest of the three: it is of a glossy surface, clear, and in some degree pellucid; in the lump, of a yellowish red colour, with a purple cast; when reduced to powder, of a bright golden colour. It is hard and friable in the winter, somewhat pliable in summer, and grows soft betwixt the fingers. Its taste is bitter, accompanied with an aromatic flavour, but insufficient to prevent its being disagreeable: the smell is not very unpleasant, and somewhat resembles that of myrrh.

2. *ALOE Hepatica*, hepatic, Barbadoes, or common aloes (the juice of a variety of the former), is not so clear and bright as the foregoing sort; it is also of a darker colour, more compact texture, and for the most part drier. Its smell is much stronger and more disagreeable; the taste intensely bitter and nauseous, with little or nothing of the fine aromatic flavour of the Socotorine.—The best hepatic aloes come from Barbadoes in large gourd-shells; an inferior sort of it (which is generally soft and clammy) is brought over in casks.

Of the cultivation and preparation of hepatic aloes in the island of Barbadoes, we have the following account in the London Medical Journal*. “The lands in the vicinity of the sea, that is, from two to three miles, which are rather subject to drought than otherwise, and are so stony and shallow as not to admit of the planting of sugar canes with any prospect of success, are generally found to answer best for the aloe plant. The stones, at least the larger ones, are first picked up, and either packed in heaps, upon the most

shallow barren spots, or laid round the field as a dry wall. The land is then lightly ploughed, and very carefully cleared of all noxious weeds, lined at one foot distance from row to row, and the young plants set, like cabbages, at about five or six inches from each other. This regular mode of lining and setting the plants is practised only by the most exact planters, in order to facilitate the weeding of them, by hand, very frequently; because, if they are not kept perfectly clean and free from weeds, the produce will be but very small. They will bear being planted in any season of the year, even in the driest, as they will live on the surface of the earth for many weeks without a drop of rain. The most general time, however, of planting them, is from April to June.

“In the March following, the labourers carry a parcel of tubs and jars into the field, and each takes a slip or breadth of it, and begins by laying hold of a bunch of the blades, as much as he can conveniently grasp with one hand, while with the other he cuts it just above the surface of the earth, as quickly as possible (that the juice may not be wasted), and then places the blades in the tub, bunch by bunch, or handful by handful. When the first tub is thus packed quite full, a second is begun (each labourer having two); and by the time the second is filled, all the juice is generally drained out of the blades in the first tub. The blades are then lightly taken out, and thrown over the land by way of manure; and the juice is poured out into a jar. The tub is then filled again with blades, and so alternately till the labourer has produced his jar full, or about four gallons and an half of juice, which is often done in six or seven hours, and he has then the remainder of the day to himself, it being his employer's interest to get each day's operation as quickly done as possible.—It may be observed, that although aloes are often cut in nine, ten, or twelve months after being planted, they are not in perfection till the second and third year; and that they will be productive for a length of time, say 10 or 12 years, or even for a much longer time, if good dung, or manure of any kind, is strewed over the field once in three or four years, or oftener if convenient.

“The aloe juice will keep for several weeks without injury. It is therefore not boiled till a sufficient quantity is procured to make it an object for the boiling-house. In the large way, three boilers, either of iron or of copper, are placed to one fire, though some have but two, and the small planters only one. The boilers are filled with the juice; and, as it ripens or becomes more inspissated, by a constant but regular fire, it is laded forward from boiler to boiler, and fresh juice is added to that farthest from the fire, till the juice in that nearest to the fire (by much the smallest of the three, and commonly called by the name of *tatch*, as in the manufactory of sugar) becomes of a proper consistency to be skipped or laded out into gourds, or other small vessels, used for its final reception. The proper time to skip or ladle it out of the tatch, is when it is arrived at what is termed a resin height, or when it cuts freely, or in thin flakes, from the edges of a small wooden slice, that is dipped from time to time into the tatch for that purpose. A little lime-water is used by some aloe-boilers, during the process, when the ebullition is too great.

* Vol. viii
Art. 8.

Aloe.

"As to the sun-dried aloes (which is most approved for medicinal purposes), very little is made in Barbadoes. The process is, however, very simple, though extremely tedious. The raw juice is either put into bladders, left quite open at top, and suspended in the sun, or in broad shallow trays of wood, pewter, or tin, exposed also to the sun, every dry day, until all the fluid parts are exhaled, and a perfect resin formed, which is then packed up for use, or for exportation."

The Barbadoes aloes is said to be common also in the other West India islands; and the following account of the manner of preparing it in Jamaica is given by Dr Wright in the same volume of the Medical Journal, art. 1. "The plant is pulled up by the roots, and carefully cleansed from the earth or other impurities. It is then sliced and cut in pieces into small hand-baskets or nets. These nets or baskets are put into large iron boilers with water, and boiled for ten minutes, when they are taken out, and fresh parcels supplied till the liquor is strong and black. At this period the liquor is thrown through a strainer into a deep vat, narrow at bottom, to cool, and to deposit its feculent parts. Next day the clear liquor is drawn off by a cock, and again committed to the large iron vessel. At first it is boiled briskly; but towards the end of the evaporation is slow, and requires constantly stirring to prevent burning. When it becomes of the consistence of honey, it is poured into gourds or calabashes for sale. This hardens by age."

3. *Aloe-Caballina*, fetid, caballine, or horse-aloes, is supposed to be a coarser sort obtained from the same species with the foregoing; according to others, it is the produce of the disticha. It is chiefly distinguishable by its strong rank smell.

All the different kinds are gum-resins, which contain more gummy than resinous parts. Water, when of a boiling heat, dissolves all the soluble parts of aloes; but if let stand till it grows cold, it lets drop most of its resin. A strong spirit dissolves and keeps suspended almost the whole of aloes, though it contains such a large portion of gummy parts; hence it is evident, that aloes contains some principle, saline or other, which renders water capable of dissolving resin, and spirit capable of dissolving gum.

Aloes is a stimulating stomachic purge, which, given in small quantity, operates mildly by stool; but in large doses acts roughly, and often occasions an irritation about the anus, and sometimes a discharge of blood. It is a good opening medicine to people of a lax habit, or who live a sedentary life; and to those whose stomach and bowels are loaded with phlegm or mucus, or who are troubled with worms, or are debilitated; because at the same time that it carries off those viscid humours which pall the appetite, and overload the intestines, it serves as a strengthener and bracer. In small doses, repeated from time to time, it not only cleanses the prima viæ, but likewise tends to promote the menstrual discharge in women; and therefore it is frequently employed in chlorosis, or where the menstrua are obstructed. It is a good stomachic purge, and is given in all cases where such a one is wanted; but it is looked upon as a heating medicine, and not proper in bilious habits, or where there is much heat or fever; and its continued use is apt to bring on the piles.

It is given in substance from five grains to a scruple,

though formerly it used to be prescribed in doses of two or three times that quantity; but these large doses sometimes brought on troublesome symptoms. As it is a slow working purge, it is generally taken at bedtime, and it operates next day.

With regard to this, as well as all other resinous purges, it ought to be observed, that when they are given in substance without any mixture, they are apt to adhere to the coats of the intestines, and to occasion griping and uneasiness; for these reasons aloes is generally mixed with some saponaceous or resolvent body, to destroy its viscid tenacity, before it is given in substance. The substances which are most used for this purpose are, a small quantity of the fixt alkaline salts; soap; the yolk of an egg; and gummy vegetable extracts. Mr Barton alleges*, that by triturating aloes with a small quantity of alkaline salts, its tenacity was more effectually destroyed than by any other thing he tried: that Castile soap and the yolk of an egg answered best, next to it; that manna, sugar, and honey, were far inferior to them; and that gummy, or mucous vegetable extracts, such as the extracts of gentian, or of liquorice root, triturated with the aloes, in the proportion of one part of the extract to two of the aloes, and then made up into pills with a sufficient quantity of syrup, destroyed the viscidness of the aloes, and rendered its operation mild.

Socotorine aloes contains more gummy matter than the hepatic; and hence it is likewise found to purge more, and with greater irritation. The first sort therefore is most proper where a stimulus is required, as for promoting or exciting the menstrual flux; whilst the latter is better calculated to act as a common purge. For the aloetic preparations, see PHARMACY. Index.

Aloes-Wood. See *Xrilo-Aloes*.

American Aloe. See *AGAVE*.

ALOGIANS, in church-history, a sect of ancient heretics, who denied that Jesus Christ was the Logos, and consequently rejected the gospel of St John—The word is compounded of the privative *a*, and *λογος*, q. d. *without Logos or Word*.—Some ascribe the origin of the name, as well as of the sect of Alogians, to Theodore of Byzantium, by trade a currier; who having apostatized under the persecution of the emperor Severus, to defend himself against those who reproached him therewith, said, that it was not God he denied, but only man. Whence his followers were called in Greek *αλογοι*, because they rejected the Word. But others, with more probability, suppose the name to have been first given them by Epiphanius in the way of reproach. They made their appearance toward the close of the second century.

ALOGOTROPHIA, among physicians, a term signifying the unequal growth or nourishment of any part of the body, as in the rickets.

ALOOFF, has frequently been mentioned as a sea-term; but whether justly or not, we shall not presume to determine. It is known in common discourse to imply *at a distance*; and the resemblance of the phrases *keep a loof*, and *keep a luff*, or *keep the luff*, in all probability gave rise to this conjecture. If it was really a sea-phrase originally, it seems to have referred to the dangers of a lee-shore, in which situation the pilot might naturally apply it in the sense commonly understood, viz. *keep all off*, or quite off: it is, however, never expressed in that

Alpha,
Alphabet.

that manner by seamen now. See LUFF. It may not be improper to observe, that besides using this phrase in the same sense with us, the French also call the weather-side of a ship, and the weather-clue of a course, *le lof*.

ALOPECE, ALOPECIA (anc. geog.), an island placed by Ptolemy at the mouth of the Tanais, and called the island *Tanais*: now *l'Isle des Renards* (Baudrand). Also an island of the Bosphorus Cimmericus (Pliny); and another in the Egean sea, over-against Smyrna.

ALOPECIA, a term used among physicians to denote a total falling off of the hair from certain parts, occasioned either by the defect of nutritious juice, or by its vicious quality corroding the roots of it, and leaving the skin rough and colourless.

The word is formed from *άλωτης*, *vulpes*, "a fox;" whose urine, it is said, will occasion baldness; or because it is a disease which is common to that creature. It is directed to wash the head every night at going to bed with a ley prepared by boiling the ashes of vine branches in red wine. A powder made by reducing hermodactyls to fine flour, is also recommended for the same purpose.

In cases where the baldness is total, a quantity of the finest burdock roots are to be bruised in a marble mortar, and then boiled in white wine until there remains only as much as will cover them. This liquor, carefully strained off, is said to cure baldness, by washing the head every night with some of it warm. A ley made by boiling ashes of vine branches in common water, is also recommended with this intention. A fresh cut onion, rubbed on the part until it be red and itchy, is likewise said to cure baldness.

A multitude of such remedies are every where to be found in the works of Valescus de Taranta, Rondeletius, Hollerius, Trincavellius, Celsus, Senertay, and other practical physicians. See also BUXUS.

ALOPECURUS, or FOX-TAIL GRASS, in botany: A genus of the triandria digynia class; and in the natural method ranking under the 4th order, *Gramina*. The characters are: The *calyx* is a single-flower'd bivalve glume: The *corolla* is one-valved: The *stamina* consist of three capillary filaments; the antheræ bifurcated at both ends: The *pistillum* is a roundish germen; there are two styli; and the stigmata are simple: The *pericarpium* is a corolla cloathing the seed; and the *seed* is single and roundish. There are eight species, viz. the *pratensis*, or meadow fox-tail grass; the *bulbosus*, or bulbous fox-tail grass; the *geniculatus*, or fote fox-tail grass; and the *myofuroides*, or field fox-tail grass; these four grow wild in Britain: the *agrestis*, the *monspeliensis*, the *panicus*, and the *hordeiformis*, are all natives of France and the southern parts of Europe, except the last, which is a native of India. See GRASS.

ALOPEX, in zoology, a species of the canis, with a strait tail and black tip. It is commonly called the *field fox*.

ALOSA, the shad, or mother of herrings, a species of the clupea. See CLUPEA.

ALOST, a town in Flanders, belonging to the house of Austria, seated on the river Dender, in the midway between Brussels and Ghent. It has but one parish; but the church is collegiate, and has a provost,

a dean, and twelve canons. Here is a convent of Carmelites, another of capuchines, another of bare-footed Carmelites, three nunneries, an hospital, and a convent of Guillemins, in which is the tomb of Theodore Martin, who brought the art of printing out of Germany into the Low Countries. He was a friend of Erasmus, who wrote his epitaph. E. Long. 4. 10. N. Lat. 49. 55.

ALPHA, the name of the first letter of the Greek alphabet, answering to our A.—As a numeral, it stands for one, or the first of any thing. It is particularly used, among ancient writers, to denote the chief or first man of his class or rank. In this sense, the word stands contradistinguished from *beta*, which denotes the second person. Plato was called the *Alpha* of the wits: Eratosthenes, keeper of the Alexandrian library, whom some called a Second Plato, is frequently named *Beta*.

ALPHA is also used to denote the beginning of any thing. In which sense it stands opposed to *omega*, which denotes the end. And these two letters were made the symbol of Christianity; and accordingly were engraven on the tombs of the ancient Christians, to distinguish them from those of idolaters. Moralez, a Spanish writer, imagined that this custom only commenced since the rise of Arianism; and that it was peculiar to the orthodox, who hereby made confession of the eternity of Christ: but there are tombs prior to the age of Constantine whereon the two letters were found, besides that the emperor just mentioned bore them on his labarum before Arius appeared.

ALPHABET, the natural or customary series of the several letters of a language (see LANGUAGE and WRITING). The word is formed from *alpha* and *beta*, the first and second letters of the Greek alphabet. The number of letters is different in the alphabets of different languages. The English alphabet contains 24 letters; to which if we add *j* and *v* consonant, the sum will be 26: the French contains 23; the Hebrew, Chaldee, Syriac, and Samaritan, 22 each; the Arabic 28; the Persian 31; the Turkish 33; the Georgian 36; the Coptic 32; the Muscovite 43; the Greek 24; the Latin 22; the Slavonic 27; the Dutch 26; the Spanish 27; the Italian 20; the Ethiopic and Tartarian, each 202; the Indians of Bengal 21; the Baramese 19. The Chinese have, properly speaking, no alphabet, except we call their whole language by that name; their letters are words, or rather hieroglyphics, amounting to about 80,000.

It has been a matter of considerable dispute whether the method of expressing our ideas by visible symbols, called *letters*, be really a human invention; or whether we ought to attribute an art so exceedingly useful, to an immediate revelation from the Deity.—In favour of the latter opinion it has been urged,

1. The five books of Moses are universally acknowledged to be the most ancient compositions as well as the most early specimens of alphabetical writing we have. If, therefore, we suppose writing to be the result of human ingenuity, it must be different from all other arts, having been brought to perfection at once; as it seems impossible to make any real improvement on the Hebrew alphabet. It may indeed be replied, that alphabetical characters perhaps have existed many ages before the writings of Moses, though the more ancient specimens have perished. This, however, being a

Arguments for writing being a divine revelation.

mere

Alphabet.

mere unsupported assertion, without any historical testimony to corroborate it, cannot be admitted as a proof. Again, setting aside the evidence to be derived from Scripture on this subject, the simplicity of manners predominant in the early ages, the small extent of the intellectual powers of mankind, and the little intercourse which nations had with one another, which would seem more particularly to render writing necessary, can scarce allow us to suppose that such a complex and curious contrivance as alphabetical writing could be invented by a race of men whose wants were so few, their advantages so circumscribed, and their ideas so limited.

2. If alphabetical writing were a mere human invention, it might be expected that different nations would have fallen upon the same expedient independent of each other during the compass of so many ages. But no such thing has taken place; and the writing of every people on earth may be referred to one common original. If this can be proved, the argument from successive derivation, without a single instance of independent discovery, must be allowed to amount to the very highest degree of probability in favour of our hypothesis, which will now rest on the evidence for or against this fact; and which may be summed up in the following manner.

Among the European nations we find none who can pretend any right to the discovery of letters. All of them derived the art from the Romans, excepting only the Turks, who had it from the Arabians. The Romans never laid claim to the discovery; but confessed that they derived their knowledge from the Greeks, and the latter owned that they had it from the Phœnicians; who, as well as their colonists the Carthaginians, spoke a dialect of the Hebrew scarcely varying from the original. The Coptic, or Egyptian, resembles the Greek in most of its characters, and is therefore to be referred to the same original. The Chaldee, Syriac, and latter Samaritan, are dialects of the Hebrew, without any considerable deviation, or many additional words. The Ethiopic differs more from the Hebrew, but less than the Arabic; yet these languages have all issued from the same stock, as the similarity of their formation, and the numberless words common to them, all sufficiently evince; and the Persian is very nearly allied to the Arabic. Alterations indeed would naturally be produced, in proportion to the civilization of the several nations, and their intercourse with others; which will account for the superior copiousness of some above the rest. It appears then, that all the languages in use amongst men that have been conveyed in alphabetical characters, have been the languages of people connected ultimately or immediately with the Hebrews, who have handed down the earliest specimens of writing to posterity; and we have therefore the greatest reason to believe, that their method of writing, as well as their language, was derived from the same source.

This proposition will be farther confirmed from considering the sameness of the artificial denominations of the letters in the Oriental, Greek, and Latin languages, accompanied also by a similar arrangement, as *alpha, beta, &c.* It may still be objected, however, that the characters employed by the ancients to discriminate their letters are entirely dissimilar. Why

N^o 13.

should not one nation, it may be urged, adopt from the other the mode of expressing the art as well as the art itself? To what purpose did they take the trouble of inventing other characters? To this objection it may be replied, 1. From the instance of our own language we know what diversities may be introduced in this respect merely by length of time and an intercourse with neighbouring nations. And such an effect would be more likely to take place before the art of printing had contributed to establish a uniformity of character: For when every work was transcribed by the hand, we may easily imagine how many variations would arise from the fancy of the scribe, and the mode of writing so constantly different in individuals. 2. This diversity might sometimes arise from vanity. When an individual of another community had become acquainted with this wonderful art, he might endeavour to recommend himself as the inventor; and, to avoid detection, might invent other characters. 3. The characters of the alphabet might sometimes be accommodated as much as possible to the symbolical marks already in use amongst a particular people. These having acquired a high degree of sanctity by the use of many generations, would not be easily superseded without the aid of some such contrivance. 4. This is supported by the testimony of Herodotus; who informs us, that "those Phœnicians who came with Cadmus introduced many improvements among the Greeks, and alphabetical writing too, not known among them before that period. At first they used the Phœnician character; but in process of time, as the pronunciation altered, the standard of the letters was also changed. The Ionian Greeks inhabited at that time the parts adjacent to Phœnicia: who having received the art of alphabetical writing from the Phœnicians, used it, with an alteration of some few characters, and confessed ingenuously, that it was called Phœnician from the introducers of it." He tells us that he had himself seen the characters of Cadmus in a temple of Iſmenian Apollo at Thebes in Bœotia, engraven upon tripods, and very much resembling the Ionian characters. 5. The old Samaritan is precisely the same as the Hebrew language; and the Samaritan Pentateuch does not vary by a single letter in twenty words from the Hebrew: but the characters are widely different: for the Jews adopted the Chaldaic letters during their captivity at Babylon, instead of the characters of their forefathers.

3. What we know of those nations who have continued for many centuries unconnected with the rest of the world, strongly militates against the hypothesis of the human invention of alphabetical writing. The experiment has been fairly made upon the ingenuity of mankind for a longer period than that which is supposed to have produced alphabetical writing by regular gradations; and this experiment determines pre-emptorily in their favour. The Chinese, a people famous for their discoveries and mechanical turn of genius, have made some advances towards the delineation of their ideas by arbitrary signs; but have nevertheless been unable to accomplish this exquisite device; and after so long a trial to no purpose, we may reasonably infer, that their mode of writing, which is growing more intricate and voluminous every day, would never terminate in so clear, so comparatively simple,

Alphabet. simple, an expedient as that of alphabetical characters. The Mexicans, too, had made some rude attempts of the same kind; but with less success than the Chinese. We know also, that hieroglyphics were in use among the Egyptians posterior to the practice of alphabetical writing by the Jews; but whether the epistolography, as it is called, of the former people, which was in vogue during the continuance of the hieroglyphics, might not possibly be another name for alphabetical writing, cannot be decided.

4. We shall consider the argument on which the commonly received supposition entirely depends: that is, the natural gradation through the several species of symbols acknowledged to have been in use with various people, terminating at last by an easy transition, in the detection of alphabetical characters. The strength of this argument will be best understood from the following representation.

“ 1. The first method of embodying ideas would be by drawing a representation of the objects themselves. The imperfection of this method is very obvious, both on account of its tediousness and its inability of going beyond external appearances to the abstract ideas of the mind.

“ 2. The next method would be somewhat more general, and would substitute two or three principal circumstances for the whole transaction. So two kings, for example, engaging each other with military weapons, might serve to convey the idea of a war between the two nations. This abbreviated method would be more expeditious than the former; but what it gained in conciseness would be lost in perspicuity. It is a description more compendious indeed, but still a description of outward objects alone, by drawing their resemblance. To this head may be referred the picture-writing of the Mexicans.

“ 3. The next advance would be to the use of symbols: the incorporation, as it were, of abstract and complex ideas in figures more or less generalized, in proportion to the improvement of it. Thus, in the earlier stages of this device, a circle might serve to express the sun, a semicircle the moon; which is only a contraction of the foregoing method. This symbol-writing in its advanced state would become more refined, but enigmatical and mysterious in proportion to its refinement. Hence it would become less fit for common use, and therefore more particularly appropriated to the mysteries of philosophy and religion. Thus, two feet standing upon water served to express an impossibility; a serpent denoted the oblique trajectories of the heavenly bodies; and the beetle, on account of some supposed properties of that insect, served to represent the sun. The Egyptian hieroglyphics were of this kind.

“ 4. This method being still too subtle and complicated for common use, the only plan to be pursued was a reduction of the first stage of the preceding method. Thus a dot, instead of a circle, might stand for the sun; and a similar abbreviation might be extended to all the symbols. On this scheme every object and idea would have its appropriated mark: these marks therefore would have a multiplicity proportionable to the works of nature and the operations of the mind. This method was likewise practised by the Egyptians; but has been carried to greater per-

fection by the Chinese. The vocabulary of the latter is therefore infinite, or at least capable of being extended to any imaginable length. But if we compare this tedious and awkward contrivance with the astonishing brevity and perspicuity of alphabetical writing, we must be persuaded that no two things can be more dissimilar; and that the transition from a scheme constantly enlarging itself, and growing daily more intricate, to the expression of every possible idea by the modified arrangement of four-and-twenty marks, is not so very easy and perceptible as some have imagined. Indeed this seems still to be rather an expression of things in a manner similar to the second stage of symbol-writing than the notification of ideas by arbitrary signs.”

To all this we shall subjoin the following remarks, which seem to give additional force to the foregoing reasoning.

“ 1. Pliny asserts the use of letters to have been eternal; which shows the antiquity of the practice to extend beyond the æra of authentic history.

“ 2. The cabalistical doctors of the Jews maintain, that alphabetical writing was one of the ten things which God created on the evening of the Sabbath.

“ 3. Most of the profane authors of antiquity ascribe the first use of alphabetical characters to the Egyptians; who, according to some, received them from Mercury; and, according to others, from their god Teuth.

“ 4. There is very little reason to suppose that even language itself is the effect of human ingenuity and invention.”

Thus we have stated the arguments in favour of the revelation of alphabetical writing; which are answered, by those who take the contrary side, in the following manner.

1. Moses nowhere says that the alphabet was a new thing in his time; nor does he give the least hint of his being the inventor of it. The first mention we find of *writing* is in the 17th chapter of Exodus; where Moses is commanded to *write in a book*; and which took place before the arrival of the Israelites at Sinai. This shows that writing did not commence with the delivery of the two tables of the law, as some have supposed. Neither are we to conclude that the invention had taken place only a short time before; for the *writing in a book* is commanded as a thing commonly understood, and with which Moses was well acquainted. It is plain, from the command to engrave the names of the twelve tribes of Israel upon stones *like the engravings of a signet*, that writing had been known and practised among them, as well as other nations, long before. We must also remember, that the people were commanded to write the law on their door-posts, &c. so that the art seems not only to have been known, but universally practised among them. But had writing been a new discovery in the time of Moses, he would probably have commemorated it as well as the other inventions of music, &c.: Nor is there any reason to suppose that God was the immediate revealer of the art; for Moses would never have omitted to record a circumstance of such importance, as the memory of it would have been one of the strongest barriers against idolatry.

Alphabet.
Additional remarks in confirmation of these arguments.

Answers to the above arguments.

Alphabet.

Again, though several profane writers attribute the origin of letters to the gods, or to some divine person, yet this is no proof of its being actually revealed; but only that the original inventor was unknown. The learned bishop of Gloucester observes, that the ancients gave nothing to the gods of whose original they had any records; but where the memory of the invention was lost, as of seed-corn, wine, writing, civil society, &c. the gods seized the property, by that kind of right which gives strays to the lord of the manor.

As neither the sacred nor profane historians, therefore, have determined any thing concerning the invention of letters, we are at liberty to form what conjectures we think most plausible concerning the origin of them; and this, it is thought, might have taken place in the following manner.

“ 1. Men, in their rude uncultivated state, would have neither leisure, inclination, nor inducement, to cultivate the powers of the mind to a degree sufficient for the formation of an alphabet: but when a people arrived at such a pitch of civilization as required them to represent the conceptions of the mind which have no corporeal forms, necessity would occasion further exertions, and urge them to find out a more expeditious manner of transacting their business than by picture-writing.

“ 2. These exertions would take place whenever a nation began to improve in arts, manufactures, and commerce; and the greater genius such a nation had, the more improvements would be made in the notation of their language; whilst those people who had made less progress in civilization and science, would have a less perfect system of elementary characters; and perhaps advance no farther for many ages than the marks or characters of the Chinese. Hence we may see, that the business of princes, as well as the manufactures and commerce of each country, would produce the necessity of devising some expeditious manner of communicating information to one another.”

The art of writing, however, is of so great antiquity, and the early history of most nations so full of fable, that it must be extremely difficult to determine what nation or people may justly claim the honour of the invention. But as it is probable that letters were the produce of a certain degree of civilization among mankind, we must therefore have recourse to the history of those nations who seem to have been first civilized.

⁴
Claim of the Egyptians to the invention of letters.

The Egyptians have an undoubted title to a very early civilization; and many learned men have attributed the invention of letters to them. The late bishop of Gloucester contends, that Egypt was the parent of all the learning of Greece, and was resorted to by all the Grecian legislators, naturalists, and philosophers; and endeavours to prove that it was one of the first civilized countries on the globe. Their writing was of four kinds: 1. *Hieroglyphic*; 2. *Symbolic*; 3. *Epistolical*; and, 4. *Hierogrammatic*. In the most early ages they wrote like all other infant nations, by pictures; of which some traces yet remain amongst the hieroglyphics of Horapollon, who informs us, that they represented a *fuller* by a man's two feet in water; *fire*, by smoke ascending, &c. But to render this rude invention less incommodious, they soon devised the method of putting one thing of similar qualities for another.

Alphabet.

The former was called the *curiologic*, the latter the *tropical* hieroglyphic; which last was a gradual improvement on the former. These alterations in the manner of delineating hieroglyphic figures produced and perfected another character, called the *running-hand of the hieroglyphics*, resembling the Chinese writing; which having been first formed by the outlines of each figure, became at length a kind of *marks*; the natural effects of which were, that the constant use of them would take off the attention from the symbol and fix it on the thing signified. Thus the study of symbolic writing would be much abbreviated; because the writer or decypherer would have then little to do but to remember the power of the symbolic mark; whereas before, the properties of the thing or animal delineated were to be learned. This, together with the other marks by institution, to denote mental conceptions, would reduce the characters to a similar state with the present Chinese; and these were properly what the ancients called *hieroglyphical*. We are informed by Dr Robert Huntington, in his account of the Porphyry pillars, that there are some ancient monuments of this kind yet remaining in Egypt.

The sacred book or ritual of the Egyptians, according to Apuleius, was written partly in symbolic and partly in these hieroglyphic characters, in the following manner: “ He (the hierophant) drew out certain books from the secret repositories of the sanctuary, written in unknown characters, which contained the words of the sacred formula compendiously expressed, partly by figures of animals, and partly by certain marks or notes intricately knotted, revolving in the manner of a wheel, crowded together, and curled inward like the tendrils of a vine, so as to hide the meaning from the curiosity of the profane.”

But though letters were of great antiquity in Egypt, there is reason to believe that they were not first invented in that country. Mr Jackson, in his *Chronological Antiquities*, has endeavoured to prove, that they were not invented or carried into Egypt by *Taaus* or *Thoth*, the first Hermes, and son of *Misraim*, who lived about 500 years after the deluge; but that they were introduced into that country by the second Hermes, who lived about 400 years after the former. This second Hermes, according to *Diodorus*, was the inventor of grammar and music, and added many words to the Egyptian language. According to the same author also, he invented letters, rhythm, and the harmony of sounds. This was the Hermes so much celebrated by the Greeks, who knew no other than himself. On the other hand, Mr *Wife* asserts that *Moses* and *Cadmus* could not learn the alphabet in Egypt; and that the Egyptians had no alphabet in their time. He adduces several reasons to prove that they had none till they received what is called the *Coptic*, which was introduced either in the time of the *Ptolemies* or under *Psammitichus* or *Amasis*; and the oldest alphabetic letters which can be produced as Egyptian, appear plainly to have been derived from the Greek. *Herodotus* confesses, that all he relates before the reign of *Psammitichus* is uncertain; and that he reports the early transactions of that nation on the credit of the Egyptian priests, on which he did not greatly depend; and *Diodorus Siculus* is said to have been greatly imposed upon by them. *Manetho*, the oldest Egyptian historian, translated

Alphabet. translated the sacred registers out of Egyptian into Greek, which are said by Syncellus to have been written in the sacred letters, and to have been laid up by the second Mercury in the Egyptian temples. He allows the Egyptian gods to have been mortal men; but his history was very much corrupted by the Greeks, and hath been called in question by several writers from the account which he himself gave of it. After Cambyses had carried away the Egyptian records, the priests, to supply their loss, and to keep up their pretensions to antiquity, began to write new records; wherein they not only unavoidably made great mistakes, but added much of their own invention, especially as to distant times.

⁶ Claim of the Phœnicians. The Phœnicians have likewise been supposed the inventors of letters; and we have the strongest proofs of the early civilization of this people. Their most ancient historian, Sanchoniatho, lived in the time of Abibalus, father of Hiram king of Tyre. He informs us, that letters were invented by *Taaut*, who lived in Phœnicia in the 12th and 13th generations after the creation. "Misor (says he) was the son of Hamyn; the son of Misor was *Taaut*, who invented the first letters for writing." The Egyptians call him *Thoth*; the Alexandrians *Thoyth*; and the Greeks *Hermes*, or *Mercury*. In the time of this *Taaut* or *Mercury* (the grandson of Ham the son of Noah), Phœnicia and the adjacent country was governed by Uranus, and after him by his son Saturn or Cronus. He invented letters either in the reign of Uranus or Cronus; and staid in Phœnicia with Cronus till the 32d year of his reign. Cronus, after the death of his father Uranus, made several settlements of his family, and travelled into other parts; and when he came to the fourth country, he gave all Egypt to the god *Taautus*, that it should be his kingdom. Sanchoniatho began his history with the creation, and ended it with placing *Taautus* on the throne of Egypt. He does not mention the deluge, but makes two more generations in Cain's line from Protagonus to Agrovenus (or from Adam to Noah) than Moses. As Sanchoniatho has not told us whether *Taaut* invented letters either in the reign of Uranus or Cronus, "we cannot err much (says Mr Jackson) if we place his invention of them 550 years after the flood, or 20 years after the dispersion, and 2619 years before the Christian æra, and six, or perhaps ten years, before he went into Egypt." This prince and his posterity reigned at Thebes in Upper Egypt for 15 generations.

Several Roman authors attribute the invention of letters to the Phœnicians. Pliny says (A), the Phœnicians were famed for the invention of letters, as well as for astronomical observations and novel and martial arts. Curtius informs us, that the Tyrian nation are related to be the first who either taught or learned letters; and Lucan says, that they were the first who attempted to express sounds or words by letters. Eusebius also tells us from Porphyry, that "Sanchoniatho studied with great application the writings of *Taaut*, knowing that he was the first who invented letters."

Alphabet. The Greeks, as we have already observed; knew no older *Hermes* than the second, who lived about 400 years after the *Mezrite Taaut* or *Hermes*. This second *Hermes* is called by Plato *Theuth*, and counsellor or sacred scribe to king *Thanius*; but it is not said that he ever reigned in Egypt: but the former *Taaut*, or *Athothes*, as *Monetho* calls him, was the immediate successor of *Menes* the first king of Egypt. This second *Mercury*, if we may believe *Manetho*, composed several books of the Egyptian history; and having improved both the language and letters of that nation, the Egyptians attributed the arts and inventions of the former to the latter. The Phœnician language is generally allowed to have been a dialect of the Hebrew; and tho' their alphabet does not entirely agree with the Samaritan, yet there is a great similarity between them. Astronomy and arithmetic were much cultivated among them in the most early ages; their fine linen, purple, and glass, were much superior to those of other nations; and their extraordinary skill in architecture and other arts was such, that whatever was great, elegant, or pleasing, whether in buildings, apparel, or toys, was distinguished by the epithet of Tyrian or Sidonian; these being the chief cities of Phœnicia. Their great proficiency in learning and arts of all kinds, together with their engrossing all the commerce of the western world, are likewise thought to give them a just claim to the invention of letters.

⁷ Of the Chaldeans. The Chaldeans also have laid claim to the invention of letters; and with regard to this, there is a tradition among the Jews, Indians, and Arabians, that the Egyptians derived their knowledge from Abraham, who was a Chaldean. This tradition is in some degree confirmed by most of the western writers, who ascribe the inventions of arithmetic and astronomy to the Chaldeans. Josephus positively asserts, that the Egyptians were ignorant of the sciences of arithmetic and astronomy before they were instructed by Abraham; and Sir Isaac Newton admits, that letters were known in the line of that patriarch for many centuries before Moses. The Chaldaic letters appear to have been derived from the Hebrew or Samaritan; which are the same, or nearly so, with the old Phœnician. Ezra is supposed to have exchanged the old Hebrew characters for the more beautiful and commodious Chaldee, which are still in use. Berosus, the most ancient Chaldean historian, who was born in the minority of Alexander the Great, does not say that he believed his countrymen to have been the inventors of letters.

⁸ Of the Syrians. The Syrians have also laid claim to the invention of letters. It is certain, indeed, that they yielded to no nation in knowledge and skill in the fine arts. Their language is said to have been the vernacular of all the oriental tongues, and was divided into three dialects. 1. The Aramean, used in Mesopotamia, and by the inhabitants of Roha and Edesa of Harram, and the Outer Syria. 2. The dialect of Palestine; spoken by the inhabitants of Damascus, Mount Libanus, and the Inner Syria. 3. The Chaldee or Nabathean dialect, the most unpolished of the three; and spoken in the mountainous parts of Assyria, and the villages of

Alphabet. Irac or Babylonia. It has been generally believed, that no nation of equal antiquity had a more considerable trade than the Syrians: they are supposed to have first brought the commodities of Persia and India into the west of Asia; and they seem to have carried on an inland trade by engrossing the navigation of the Euphrates, whilst the Phœnicians traded to the most distant countries. Notwithstanding these circumstances, however, which might seem to favour the claim of the Syrians, the oldest characters they have are but about three centuries before Christ. Their letters are of two sorts. 1. The Estrangelo, which is the more ancient; and, 2. The Fshito, the simple or common character, which is the more expeditious and beautiful.

9
Of the In-
dians.

We must next examine the claims of the Indians, whose pretensions to antiquity yield to no other nation on earth. Mr Halhed, who has written a grammar of the Shanferit language, informs us, that it is not only the grand source of Indian literature, but the parent of almost every dialect from the Persian gulph to the Chinese seas, and which is said to be a language of the most venerable antiquity. At present it is appropriated to religious records of the Bramins, and therefore shut up in their libraries; but formerly it appears to have been current over the greatest part of the eastern world, as traces of its extent may be found in almost every district of Asia.

Mr Halhed informs us, that "there is a great similarity between the Shanferit words and those of the Persian and Arabic, and even of Latin and Greek; and these not in technical or metaphorical terms, but in the main ground-works of language; in monosyllables, the names of numbers, and the appellations of such things as would be first discriminated on the immediate dawn of civilization. The resemblance which may be seen of the characters on the medals and signets of different parts of Asia, the light they reciprocally throw upon one another, and the general analogy which they all bear to the grand prototype, affords another ample field for curiosity. The coins of Assam, Napaal, Cashmiria, and many other kingdoms, are all stamped with Shanferit letters, and mostly contain allusions to the old Shanferit mythology. The same conformity may be observed in the impressions of seals from Bootan and Thibet."

The country between the Indus and Ganges still preserves the Shanferit language in its original purity, and offers a great number of books to the perusal of the curious; many of which have been handed down from the earliest periods of human civilization.

There are seven different sorts of Indian hand-writings, all comprised under the general term of *Naagoree*, which may be interpreted *writing*. The Bramins say that letters were of divine original; and the elegant Shanferit is styled *Daeb-naagoree*, or the writings of the Immortals, which might not improbably be a refinement from the more simple *Naagoree* of former ages. The Bengal letters are another branch of the same stock. The Bramins of Bengal have all their Shanferit books copied in their national alphabet, and they transpose into them all the *Daeb-naagoree* manuscripts for their own perusal. The Moorish dialect is that species of Hindostanic which we owe to the conquests of the Mahometans.

The Shanferit language contains about 700 radical

words; the fundamental part being being divided into three classes, viz. 1. *Dhaat*, or roots of verbs; 2. *Shudd*, or original nouns; 3. *Veysa*, or particles. Their alphabet contains 50 letters; viz. 34 consonants and 16 vowels. They assert that they were in possession of letters before any other nation in the world; and Mr Halhed conjectures, that the long-boasted original civilization of the Egyptians may still be a matter of dispute. The Rajah of Kishinagur affirms, that he has in his possession Shanferit books, where the Egyptians are constantly described as disciples, not as instructors; and as seeking in Hindostan that liberal education, and those sciences, which none of their own countrymen had sufficient knowledge to impart. Mr Halhed hints also, that the learning of Hindostan might have been transplanted into Egypt, and thus have become familiar to Moses. Several authors, however, are of opinion, that the ancient Egyptians possessed themselves of the trade of the East by the Red Sea, and that they carried on a considerable traffic with the Indian nations before the time of Sesostris; whom they suppose to have been cotemporary with Abraham, though Sir Isaac Newton conjectures him to have been the Shifhak who took Jerusalem in the time of Rehoboam.

In the year 1769, one of the sacred books of the Gentoos called *Bagavadam*, translated by Meridas Poule, a learned man of Indian origin, and chief interpreter to the supreme council of Pondicherry, was sent by him to M. Bertin in France. In his preface he says, that it was composed by Viasfer the son of Brahma, and is of sacred authority among the worshippers of Vishnow. This book claims an antiquity of 5000 years; but M. de Guines has shown, that its pretensions to such extravagant antiquity are entirely inconclusive and unsatisfactory: whence we may conclude, says Mr Astle, that though a farther inquiry into the literature of the Indian nations may be laudable, yet we must by no means give too easy credit to their relations concerning the high antiquity of their manuscripts and early civilization.

It is not pretended that the Persians had any great learning among them till the time of Hytaspes the father of Darius. The former, we are told, travelled into India, and was instructed by the Bramins in the sciences for which they were famed at that time. The ancient Persians despised riches and commerce, nor had they any money among them till after the conquest of Lydia. It appears by several inscriptions taken from the ruins of the palace of Persepolis, which was built near 700 years before the Christian æra, that the Persians sometimes wrote in perpendicular columns like the Chinese. This mode of writing was first made use of on the stems of trees, pillars, or obelisks. As for those simple characters found on the west side of the stair-case of Persepolis, some have supposed them to be alphabetic, some hieroglyphic, and others antediluvian. Dr Hyde pronounces them to have been mere whimsical ornaments, though the author of *Conjectural Observations on Alphabetic Writing* supposes them to be fragments of Egyptian antiquity brought by Cambyses from the spoils of Thebes. The learned are generally agreed, that the Persians were later in civilization than many of their neighbours; and they are not supposed to have any pretensions to the invention of letters.

As the Arabians have been in possession of the country

Persia;

Alphabet. try they now inhabit for upwards of 3700 years, without being internixed with foreign nations, or subjugated by any other power, their language must be very ancient. The two principal dialects of it were that spoken by the Hamyarites and other genuine Arabs; and that of the Koreish, in which Mahomet wrote the Alcoran. The former is named by oriental writers *the Arabic of Hamyar*; the latter, *the pure, or defecated Arabic*. Mr Richardson observes, as a proof of the richness of this language, that it consists of 2000 radical words.

The old Arabic characters are said to have been of very high antiquity; for Ebn Hashem relates, that an inscription in it was found in Yaman as old as the days of Joseph. Hence some have supposed that the Arabians were the inventors of letters; and Sir Isaac Newton is of opinion, that Moses learned the alphabet from the Midianites, who were Arabians.

The alphabet of the Arabs consists of 28 letters similar to the ancient Cufic, in which the first copies of the Alcoran were written. The present Arabic characters were formed by Ebn Moklah, a learned Arabian, who lived about 300 years after Mahomet. The Arabian writers themselves inform us, that their alphabet is not very ancient, and that they received it only a short time before the introduction of Islamism.

On this account of the pretensions of different nations to the invention of letters, Mr Astle makes the following reflections. "The vanity of each nation induces them to pretend to the most early civilization; but such is the uncertainty of ancient history, that it is difficult to determine to whom the honour is due. It should seem, however, that the contest may be confined to the Egyptians, the Phœnicians, and the Chaldeans. The Greek writers, and most of those who have copied them, decide in favour of Egypt, because their information is derived from the Egyptians themselves. The positive claim of the Phœnicians does not depend entirely upon the testimony of Sanchoniatho; the credit of his history is so well supported by Philo of Byblus his translator, Porphyry, Pliny, Curtius, Lucan, and other ancient writers, who might have seen his works entire, and whose relations deserve at least as much credit as those of the Egyptian and Greek writers. It must be allowed, that Sanchoniatho's history contains many fabulous accounts; but does not the ancient history of the Egyptians, the Greeks, and most other nations, abound with them to a much greater degree? The fragments which we have of this most ancient historian are chiefly furnished by Eusebius, who took all possible advantages to represent the Pagan writers in the worst light, and to render their theology absurd and ridiculous.

"The Phœnician and Egyptian languages are very similar; but the latter is said to be more large and full, which is an indication of its being of a later date. The opinion of Mr Wile, however, that the ancient Egyptians had not the knowledge of letters, seems to be erroneous; as they had commercial intercourse with their neighbours the Phœnicians, they probably had the knowledge of letters, if their policy, like that of the Chinese at this day, did not prohibit the use of them.

"The Chaldeans, who cultivated astronomy in the most remote ages, used symbols or arbitrary marks in

their calculations; and we have shown, that these were the parents of letters. This circumstance greatly favours their claim to the invention; because Chaldea, and the countries adjacent, are allowed by all authors, both sacred and profane, to have been peopled before Egypt; and it is certain that many nations said to be descended from Shem and Japhet, had their letters from the Phœnicians, who were descended from Ham.

"It is observable, that the Chaldeans, the Syrians, Phœnicians, and Egyptians, all bordered upon each other; and as the Phœnicians were the greatest as well the most ancient commercial nation, it is very probable that they communicated letters to the Egyptians, the ports of Tyre and Sidon being not far distant from each other.

"Mr Jackson is evidently mistaken when he says, that letters were invented 2619 years before the birth of Christ. The deluge recorded by Moses was 2349 years before that event; and if letters were not invented till 550 years after, as he asserts, we must date their discovery only 1799 years before the Christian æra, which is 410 years after the reign of Menes the first king of Egypt, who, according to Syncellus and others, is said to have been the same person with the Misor of Sanchoniatho, the Mizraim of the Scriptures, and the Osiris of the Egyptians; but whether this be true or not, Egypt is frequently called in Scripture *the land of Mizraim*.

"This Mizraim, the second son of Amyn or Ham, seated himself near the entrance of Egypt at Zoan, in the year before Christ 2188, and 160 years after the flood. He afterwards built Thebes, and some say Memphis. Before the time that he went into Egypt, his son Taaut had invented letters in Phœnicia; and if this invention took place ten years before the migration of his father into Egypt, as Mr Jackson supposes, we may trace letters as far back as the year 2178 before Christ, or 150 years after the deluge recorded by Moses: and beyond this period, the written annals of mankind, which have been hitherto transmitted to us, will not enable us to trace the knowledge of them; though this want of materials is no proof that letters were not known until a century and an half after the deluge. As for the pretensions of the Indian nations, we must be better acquainted with their records before we can admit of their claim to the first use of letters; especially as none of their manuscripts of any great antiquity have as yet appeared in Europe. That the Arabians were not the inventors of letters, has appeared by their own confession.—Plato somewhere mentions Hyperborean letters very different from the Greek; these might have been the characters used by the Tartars or ancient Scythians.

"It may be expected that something should be said concerning those books mentioned by some authors to have been written before the deluge. Amongst others, Dr Parsons, in his *Remains of Japhet*, p. 346. 359. supposes letters to have been known to Adam; and the Sabæans produce a book which they pretend was written by Adam. But concerning these we have no guide to direct us any more than concerning the supposed books of Enoch; some of which, Origin tells us, were found in Arabia Felix, in the dominion of the queen of Saba. Tertullian affirms, that he saw

and

Alphabet. and read several pages of them; and in his treatise *De Habitu Mulierum*, he places those books among the canonical: but St Jerom and St Austin look upon them to be apocryphal. William Postellus pretended to compile his book *De Originibus* from the book of Enoch; and Thomas Bangius published at Copenhagen, in 1657, a work which contains many singular relations concerning the manner of writing among the antediluvians, which contains several pleasant stories concerning the books of Enoch.

“With regard to this patriarch, indeed, St Jude informs us, that he *prophefied*, but he does not say that he *wrote*. The writings, therefore, attributed to the antediluvians, must appear quite uncertain; though it might be improper to assert that letters were unknown before the deluge recorded by Moses.”

14
All the alphabets in the world cannot be proved to arise from one original.

Our author proceeds to show, that all the alphabets in the world cannot be derived from one original; because there are a variety of alphabets used in different parts of Asia, which vary in name, number, figure, order, and power, from the Phœnician, ancient Hebrew, or Samaritan. In several of these alphabets also, there are marks for sounds peculiar to the language of the east, which are not necessary to be employed in the notation of the languages of Europe.

None of the alphabets to the east of Persia have any connection with the Phœnician or its derivatives, except where the Arabic letters have been introduced by the conquests of the Mahometans. The foundation of all the Indian characters are those called *shanfrit*, or *sungskrit*. This signifies something brought to perfection, in contradistinction to *prakrit*, which signifies vulgar or unpolished. Hence the refined and religious language and characters of India are called *Sungskrit*, and the more vulgar mode of writing and expression *Prakrit*. From this Shanfrit are derived the sacred characters of Thibet, the Cashmirian, Bengalese, Malabaric, and Tamoul; the Singalese, Siamefe, Maharattan, Concanee, &c. From the same source we may derive the Tangutic or Tartar characters, which are similar, in their great outlines, to the Shanfrit; though it is not easily determined which is derived from the other. The common Tartar is generally read, like the Chinese, from top to bottom.

There are, however, several alphabets used in different parts of Asia, entirely different not only from the Shanfrit and all those derived from it, but also from the Phœnician and those which proceed from it. Some of these are the alphabet of Pegu, the *Batta* characters used in the island of Sumatra, and the *Barman* or *Boman* characters used in some parts of Pegu. The names and powers of the letters of which these alphabets are composed, differ entirely from the Phœnician, or those derived from them. It is impossible to assimilate their forms, and indeed it is by no means easy to conceive how the 50 letters of the Shanfrit language could be derived from the Phœnician alphabet, which consisted originally only of 13; though it is certain, that by far the greater number of alphabets now in use are derived from the ancient Hebrew, Phœnician, or Samaritan.

Mr Astle next proceeds to consider what alphabets are derived from the Phœnician. These he supposes to have been immediately the ancient Hebrew or Samaritan; the Chaldaic; the Bastulian (A) or Spanish Phœnician; the Punic, Carthaginian, or Sicilian; and the Pelasgian. From the ancient Hebrew proceeded the Chaldaic or square Hebrew; the round Hebrew; and what is called the *running hand of the Rabbins*. The Pelasgian gave birth to the Etruscan, Eugubian, or Umbrian, Oscan, Samnite, and Ionic Greek, written from the left. From the Chaldaic or square Hebrew are derived the Syriac, and the ancient and modern Arabic. The Syriac is divided into the Estrangelo and Mendæan, and the modern Arabic has given rise to the Persian and Turkish. From the ancient Arabic are derived the Kufic or Oriental, the Mauritanic or Occidental; the African or Saracen, and the Moorish. The Ionic Greek gave rise to the Arcadian, Latin, ancient Gaulish, ancient Spanish, ancient Gothic, Coptic, Ethiopic, Russian, Illynian or Sclavonic, Bulgarian and Armenian. From the Roman are derived the Lombardic, Visigothic, Saxon, Gallican, Franco-Gallic or Merovingian, German, Caroline, Capetian, and modern Gothic.

The Punic letters are also called *Tyrian*, and were much the same with the Carthaginian or Sicilian. The Punic language was at first the same with the Phœnician; it is nearly allied to the Hebrew, and has an affinity with the Chaldee and Syriac. Some remains of it are to be met with in the Maltese. To make a complete Punic, Carthaginian, or Sicilian alphabet, we must admit several pure Phœnician letters.

The Pelasgi were likewise of Phœnician original; and, according to Sanconiatho, the Dioscouri and Cabiri wrote the first annals of the Phœnician history, by order of Taaut the inventor of letters. They made ships of burthen, and being cast upon the coast near mount Casius, about 40 miles from Pelusium, where they built a temple in the second generation after the deluge related by Moses, they were called *Pelasgi* from their passing by sea, and wandering from one country to another. Herodotus informs us, that the Pelasgi were descendants of the Phœnician Cabiri, and that the Samothracians received and practised the Cabiric mysteries from them. The Pelasgic alphabet prevailed in Greece till the time of Deucalion, when the Pelasgi were driven out of Thessaly or Oenotria by the Hellenes; after which some of them settled at the mouth of the Po, and others at Croton, now *Cartona* in Tuscany. Their alphabet consisted of 16 letters, and the Tyrrhenian alphabet, brought into Italy before the reign of that prince, consisted of no more than 13. Deucalion is said to have reigned about 820 years after the deluge, and 1529 before the Christian æra.

That the Tyrrheni, Tyrseni, or Etrusci, settled in Italy long before this period, appears from the testimony of Herodotus, who informs us, that a colony went by sea from Lydia into Italy under Tyrrhenus; and Dionysius of Halicarnassus proves that many authors called them Pelasgi. He then cites Hellanicus Lesbicus, an author somewhat more ancient than Herodotus,

(A) The Bastuli are said to have been a Canaanitish or Phœnician people who fled from Joshua, and settled afterwards in Spain.

Alphabet. rodotus, to prove, that they were first called *Pelasgi Tyrreni*; and when they passed into Italy, they settled in that part of it called *Etruria*. Their emigration took place about the year of the world 2011, or 1993 years before the Christian æra, which is 350 years before the Pelasgi left Greece. Bishop Cumberland adduces many proofs to show that the Tyrrenians originally came out of Lydia into Italy. Several Roman authors also speak of this Lydian colony; and Horace compliments his patron Mæcenas upon his Lydian descent:

*Lydorum quicquid Etruscos
Incoluit fines, nemo generosior est te.*

The Etruscan letters are Pelasgic, and several of the Etruscan inscriptions are written in the Pelasgic language. The Roman letters are Ionic. The Oscan language was a dialect of the Etruscan; their characters are nearer the Ionic or Roman than the Etruscan. There is also very little difference between the Pelasgian, Etruscan, and most ancient Greek letters, which are placed from right to left. The Arcadians were ancient Greeks, and used the Ionic letters; but at what time they began to write from left to right is not known, as their chronology is very uncertain. The Etruscan, Oscan, and Samnite alphabets, are derived from the Pelasgic; they differ from each other more in name than in form, but a far greater number are derived from the Ionic Greek; namely, the Arcadian, the Latin or Roman, and the others already enumerated. The Runic is immediately derived from the Gothic.

According to Dionysius of Halicarnassus, the first Greek colony which came into Italy consisted of Arcadians under the conduct of Oenotrus the son of Lycaon, and fifth in descent from Phoroneus the first king of Argos, who reigned about 566 years before the taking of Troy, and 1750 years before the Christian æra. These Oenotrians were called *Aborigines*; and after they had been engaged for many years in a war with the Siculi, entered into an alliance with a colony of the Pelasgi, who came out of Thessaly into Italy, after having been driven from the former country.—About 1476 B. C. another colony of the Pelasgi, who had been driven out of Thessaly by the Curetes and Leleges, arrived in Italy, where they assisted the Aborigines to drive out the Siculi; possessing themselves of the greatest part of the country between the Tiber and the Liris, and building several cities. Solinus and Pliny tell us, that the Pelasgi first carried letters into Italy; and the latter distinguishes between the Pelasgi and the Arcades; so the letters first carried into Italy were not the Ionic Greek, but those more ancient Pelasgi characters which the Pelasgi carried with them before Deucalion and Cadmus are said to have come into Bœotia and Thessaly. The story of Cadmus is much involved in fable; but it is agreed by most of the ancients, that the children of Agenor, viz. Cadmus, Europa, Phoenix, and Cilix, carried with them a colony, composed of Phœnicians and Syrians, into Asia Minor, Crete, Greece, and Lybia, where they introduced letters, music, poetry, and other arts, sciences, and customs, of the Phœnicians.

Dionysius enumerates the following Greek colonies which came into Italy: 1. The Aborigines under Oenotrus from Arcadia. 2. The Pelasgic colony which came from Hæmonia or Thessaly. 3. Another Arca-

dian colony which came with Evander from Palantium. **Alphabet.** 4. Those who came from Peloponnesus with Hercules; and, 5. Those who came with Æneas from Troy. It is not easy to discover when the Ionic way of writing from left to right was introduced into Italy; but it is certain, that it did not universally prevail even in Greece till several ages after it was found out. The Athenians did not comply with it till the year of Rome 350; nor was it practised by the Samnites even in the sixth century of that city, or 230 years before Christ: for M. Gæbelin, Vol. VI. pl. 2. gives us the Samnite alphabet of that century, wherein the letters are placed from right to left; although the Ionic way of writing prevailed in some parts of Italy in the third century of Rome. “In time (says Pliny), the tacit consent of all nations agreed to use the Ionic letters. The Romans consented to this mode about the time of Tarquinius Priscus their fifth king.” The letters brought by Damaratus the Corinthian, the father of Tarquin, Mr Wise thinks, must have been the new or Ionic alphabet, and not the same with that brought by Evander 500 years before. After the Romans had established the use of the Ionic letters, they seem not to have acknowledged the Pelasgian and Etruscan to have been Greek alphabets: the most learned of them knew none older than the Ionic, as appears from the Greek Farnese inscriptions of Herodes Atticus. This learned man, out of a regard to antiquity, caused the oldest orthography to be observed in the writing, and the letters to be delineated after the most antique forms that could be found; and they are plainly no other than the Ionic or right-handed characters.

The ancient Gaulish letters are derived from the Greek, and their writing approaches more nearly to the Gothic than that of the Romans: this appears by the monumental inscription of Gordian, messenger of the Gauls, who suffered martyrdom in the third century with all his family: These ancient Gaulish characters were generally used by that people before the conquest of Gaul by Cæsar; but after that time the Roman letters were gradually introduced. The ancient Spaniards used letters nearly Greek before their intercourse with the Romans. The ancient Gothic alphabet was very similar to the Greek, and is attributed to Ulphilas, bishop of the Goths, who lived in Mæsia about 370 years after Christ. He translated the bible into the Gothic tongue. This circumstance might have occasioned the tradition of his having invented these letters; but it is probable that these characters were in use long before this time. The Runic alphabet is derived from the ancient Gothic.

The Coptic letters are derived immediately from the Greek. Some have confounded them with the ancient Egyptian; but there is a very material difference between them. The Ethiopic alphabet is derived from the Coptic.

The alphabet proceeding from that of the Scythians established in Europe, is the same with what St Cyril calls the *Servien*. The Russian, Illyrian or Slavonic, and the Bulgarian, are all derived from the Greek. The Armenian letters differ very much from the Greek, from which they are derived, as well as from the Latin.

With regard to the alphabets derived from the Latin, the Lombardic relates to the manuscripts of Italy; from the the Latin.

See Plates IX and X. for specimens of the ancient alphabets here enumerated.

Alphabet. the Visigothic to those of Spain; the Saxon to those of England; the Gallican and Franco-Gallic or Merovingian to the manuscripts of France; the German to those of that country; and the Caroline, Copetian, and Modern Gothic, to all the countries of Europe who read Latin. The first six of these alphabets are before the age of Charlemagne, the last three posterior to it. They are more distinguished by their names than the forms of their characters, and the former indicate all of them to have been of Roman extraction. Each nation, in adopting the letters of the Romans, added thereto a taste and manner peculiar to itself, which obviously distinguished it from the writings of all other people; whence arose the differences between the writings of the Lombards, Spaniards, French, Saxons, Germans, and Goths, and all the strange terms observable in the writings of the Francic Gauls or Merovingians; and those of the Carolingians their successors may be traced from the same source. From these distinctions the name of *national writing* was derived.

The writing of Italy was uniform till the irruption of the Goths, who disfigured it by their barbarous taste. In 569, the Lombards, having possessed themselves of all Italy, excepting Rome and Ravenna, introduced that form of writing which goes under their name; and as the Popes used the Lombardic manner in their bulls, the name of *Roman* was sometimes given to it in the 11th century; and though the dominion of the Lombards continued no longer than 206 years, the name of their writing continued in Italy from the 7th to the 13th century, and then ceased; when learning, having declined in that as well as in other countries, the manner of writing degenerated into the modern Gothic.

The Visigoths introduced their form of writing into Spain, after having over-run that country; but it was abolished in a provincial synod held at Leon in 1091, when the Latin characters were established for all public instruments, though the Visigothic were used in private writings for three centuries afterwards.

The Gauls, on being subjected by the Romans, adopted their manner of writing; but by subsequent additions of their own, their characters were changed into what is called the Gallican or *Roman Gallic* mode. This was changed by the Franks into the *Franco-Gallic* or *Merovingian* mode of writing, being practised under the kings of the Merovingian race. It took place towards the close of the sixth century, and continued till the beginning of the ninth.

The German mode of writing was improved by Charlemagne, and this improvement occasioned another distinction in writing by introducing the alphabet named *Caroline*, which declined in the 12th century, and was succeeded in the 13th by the modern Gothic. In France it had degenerated by the middle of the 10th century, but was restored in 987 by Hugh Capet, whence it obtained the name of *Capetian*. It was used in England as well as Germany and France.

The modern Gothic, which spread itself all over Europe in the 12th and 13th centuries, is improperly named, as not deriving its origin from the writing anciently used by the Goths. It is, however, the worst and most barbarous way of writing, and originated among the schoolmen in the decline of the arts; being

N^o 13.

indeed nothing else than Latin writing degenerated. It began in the 12th century, and was in general use, especially among monks and schoolmen, in all parts of Europe, till the restoration of arts in the 15th century, and continued longer in Germany and the northern nations. Our statute-books are still printed in Gothic letters. The most barbarous writing of the seventh, eighth, and ninth centuries, was preferable to the modern Gothic. It is diversified in such a manner as can scarce admit of description; and the abbreviations used by the writers were so numerous, that it became very difficult to read it; which was one of the great causes of the ignorance of those times. Along with this, however, the Lombardic, Gothic, Roman, Caroline, and Copetian modes of writing, were occasionally used by individuals.

The idea that all the alphabets above mentioned are derived from the Roman, tends to prove the distinction of national writing, and is of great use in discovering the age of manuscripts: for though we may not be able exactly to determine the time when a manuscript was written, we may be able nearly to ascertain its age. For example, if a writing is Merovingian, it may be declared not to be posterior to the ninth, nor prior to the fifth, century. If another be Lombardic, it may be affirmed to be posterior to the middle of the 6th, and prior to the 13th. Should it be Saxon, it cannot be of an earlier date than the 7th, nor later than about the middle of the 12th.

Having considered whence the alphabets now in use throughout the various nations of the world are derived, it remains to say something concerning them as the elements of words, or how far they are capable of expressing those sounds, which, by proper combination and arrangement, constitute articulate language. The number of simple sounds in any language cannot be very numerous; and it is plainly these simple sounds alone that we have occasion to represent by alphabetical characters. Hence the person who first invented letters, must have been capable of analysing language in a manner which seems by no means easy to do, and concerning which even the learned among ourselves are not yet agreed. It is this difficulty which has produced the great diversity in the number of alphabetical characters used by different nations; and where we see a vast number of them used, we may account the writing not the better, but much the worse for it; and whoever the pretended inventor was, it is more reasonable to suppose that he disfigured an alphabet already invented, by unnecessary additions, than been the author of one himself.

When we consider alphabetical characters as thus resulting from an analysis of language, it will by no means appear probable that it was derived from a gradual and progressive operation of the human mind through many ages. There is not the least affinity betwixt representing any object by a picture and finding out the sounds which compose the word by which it is expressed; nor, though a nation had been in use to represent things either in this method, or by any kind of arbitrary marks, for thousands of years, could the one ever have led to the other. Arbitrary marks must always be the same with pictures in this respect, that they must always be fixed to particular objects, and thus be increased *ad infinitum*. Letters, on the other hand, are indifferent to

Alphabet.

Alphabet. all objects; and therefore, by their combinations, which are more numerous than as many arbitrary marks as we could remember, may express all the objects in nature. This might furnish an argument of some strength for the divine revelation of writing, were it not that other arts seemingly as useful, and as difficult to be invented, had not been expressly ascribed to particular persons whom we cannot suppose to have been divinely inspired. Thus metallurgy, music, the keeping of cattle, and use of tents, are all ascribed to a single family; and though writing be not expressly mentioned as an invention in Scripture, there is no reason to have recourse to a revelation for it as long as the human faculties are known to have been sufficient for the invention of it. Nevertheless, if we take a review of the different arts which mankind have invented, we shall find, that few of them resulted from any gradual progress or evolution of the powers of the human mind, but rather by some sudden and almost unaccountable turn of thought in an individual. Thus, the art of printing, little inferior in its utility to that of writing, lay hid for ages, and was at last invented we scarce know how; so that if one inclined to suppose this a divine revelation, he could be at little loss for arguments to support his hypothesis. This was what all the inventions and evolutions of human powers since the creation had never been able to accomplish; yet nobody believes that it required supernatural abilities to be the author of this art, because we see plainly that it might have occurred to the human mind from various sources, and are surprised that it did not occur long before. In like manner, the method of accounting for the celestial motions by the united forces of projection and gravitation, was no result of the progress that mankind had made in science, but luckily occurred to Mr Horrox, without any thing that we know to direct him, or perhaps from causes almost unknown to himself. Thus also, the steam-engine, aerostation, &c. were suddenly invented only by a slight review of principles well known before, and which had been a thousand times overlooked by those who might have invented both. Alphabetic writing, therefore, might have been no deduction from hieroglyphic or picture writing, from which it is essentially different; and it seems to be some confirmation of this, that all nations who ever pretended to the invention of letters, have ascribed it to the labours of one particular person, without taking notice of the progress made towards it in preceding ages.

19
Of the elementary sounds of language.

The learned author of *Hermes* informs us, that to about 20 plain elementary sounds, we owe that variety of articulate voices which have been sufficient to explain the sentiments of such an innumerable multitude as all the past and present generations of men. Mr Sheridan says, that the number of simple sounds in our tongue are 28; while Dr Kenrick says, that we have only 11 distinct species of articulate sounds, which even by contraction, prolongation, and composition, are increased only to the number of 16; every syllable or articulate sound in our language being one of the number. Bishop Wilkins and Dr William Holder speaks of 33 distinct sounds.

After the analysis or decomposition of language into the elementary sounds, the next towards the notation of it by alphabetical characters, would be the de-

lineation of a separate mark or letter to represent each found; which marks, though few in number, would admit of such a variety of arrangements and combinations, as might be capable of producing that infinity of articulate sounds which compose language. The ingenious Wachter, in his *Natura et Scriptura Concordia*, p. 64, endeavours to show, that ten marks or characters are sufficient for this purpose.—His scheme is as follows:

Alphabet.

Genus.	Figura.	Poteslar.
Vocal.	○	a. e. i. o. u.
Guttural.	○ 	k. c. ch. q. g. h.
Lingual.	∟	l.
Lingual.	∩	d. t.
Lingual.	→	r.
Dental.	∩	f.
Labial.	3	b. p.
Labial.	∩	m.
Labial.	∩	s. ph. v. w.
Nasal.	∧	n.

If this is the case, then the most simple alphabet, which consisted only of 13 letters, must have been abundantly sufficient to answer all the purposes of mankind, and much of our twenty-four letter alphabet may appear superfluous. That able mathematician Tacquet has calculated the various combinations of the 24 letters, even without any repetition, to amount to no fewer than 620,448,401,733,239,439,360,000; while Clavius makes them only 5,852,616,738,497,664,000. Either of these numbers, however, is infinite to the human conceptions, and much more than sufficient to express all the sounds that ever were articulated by man. As there are more sounds in some languages than in others, it follows of course, that the number of elementary characters, or letters, must vary in the alphabets of different languages. The Hebrew, Samaritan, and Syriac alphabets, have 22 letters; the Arabic 28, the Persian and Egyptian, or Coptic, 32; the present Russian 41; the Shanserit 50; while the Cashmirian and Malabaric are still more numerous. The following is the scheme of the English alphabet as given by Mr Sheridan in his *Rhetorical Grammar*, p. 9.

20

21 Imperfection in the English alphabet,

Mr Sheridan observes, that our alphabet is ill calculated for the notation of the English tongue, as there are many sounds for which we have no letters or marks: and there ought to be nine more characters or letters to make a complete alphabet, in which every simple sound ought to have a mark peculiar to itself. The reason of the deficiency is, that the Roman alphabet was formerly adopted for the notation of the English language, though by no means suited to the purpose.

22 Of the forms of letters.

It now remains only to take some notice of the forms of the different letters; some knowledge of which is absolutely necessary for ascertaining the age and authenticity of inscriptions, manuscripts, charters, and ancient records. Many authors are of opinion that letters derive their forms from the positions of the organs of speech in their pronunciation. Van Helmont has taken great pains to prove, that the Chaldaic characters are the genuine alphabet of Nature; because, according to him, no letter can be rightly founded without disposing the organs of speech into an uniform position with the figure of each letter; and in support of this system, he has anatomized the organs of articulation.

Mr Nelme has endeavoured to show, that all elementary characters or letters derive their forms from the line and the circle. His alphabet consists of 13 radical letters, four diminished, and four augmented.—The radicals are L, O, S, A, B, C, D, N, U, I, E, M, R.—H, according to him, is derived from A; P from B; T from D; and F from U: these are called diminished letters. The augmented ones are Z from S; G from C; W from U; and Y from I. He proves that his characters are very similar to those of the ancient Etruscans: but all characters are composed either of lines and circles of the former, and of parts of the latter.—Mr Gebelin deduces them from hieroglyphic representations, and has given several delineations of human figures, trees, &c. in confirmation of his hypothesis.

One of the most simple alphabets has been formed, by making two perpendicular and two horizontal lines:

thus, $\begin{array}{|c|c|c|} \hline a|b|c \\ \hline d|e|f \\ \hline g|h|i \\ \hline \end{array}$ from which may be deduced nine different characters or letters; thus

$\begin{array}{|c|c|c|c|c|c|} \hline a|b|c|d|e|f|g|h|i \\ \hline \end{array}$

Nine more may be made by adding a point to each, and as many more as

$\begin{array}{|c|c|c|} \hline k|l|m \\ \hline n|o|p \\ \hline q|r|s \\ \hline \end{array}$ may be sufficient

Alphænia, Alphery.

for the notation of any language, by adding two or more points to each character. Though these square characters are not calculated for dispatch; yet they may be made as expeditiously, or more so, than the Tartar, the Bramin, the Cashmirian, or many others. Writing composed of these characters, is at first sight somewhat like the Hebrew.—Mr Dow, author of the History of New

23 language invented by Mr Dow.

Indostan, lately formed a new language and alphabet. This language, and the characters formed for its notation, were so easy, that a female of his acquaintance acquired the knowledge of them in three weeks, and corresponded with him therein during their intimacy.

ALPHÆNIX, white barley-fugar, to which is given an extraordinary name, to render it more valuable. This fugar, which is thought good for colds, is made of common fugar, which is boiled until it becomes easy to crack, when they pour it upon a marble table, greased with oil of sweet almonds, and mould it into various figures with a brass crotchet. It is easily falsified with starch.

ALPHERY (Mikipher), born in Russia, and of the Imperial line. When that country was torn to pieces by intestine quarrels, in the latter end of the 16th century, and the royal house particularly was so severely persecuted by impostors, this gentleman and his two brothers were sent over to England, and recommended to the care of Mr Joseph Bidell, a Russia merchant. Mr Bidell, when they were of age fit for the university, sent them all three to Oxford, where the small-pox unhappily prevailing, two of them died of it. We know not whether this surviving brother took any degrees or not, but it is very probable he did, since he entered into holy orders; and in the year 1618, had the rectory of Wooley in Huntingtonshire, a living of no very considerable value, being rated at under L. 10 in the king's books. Here he did his duty with great cheerfulness and alacrity; and although he was twice invited back to his native country by some who would have ventured their utmost to have set him on the throne of his ancestors, he chose rather to remain with his flock, and to serve God in the humble station of a parish priest. Yet in 1643, he underwent the severest trials from the rage of the fanatics; who, not satisfied with depriving him of his living, insulted him in the most barbarous manner; for having procured a file of musqueteers to pull him out of his pulpit, as he was preaching on a Sunday, they turned his wife and small children into the street, into which also they threw his goods. The poor man in this distress raised him a tent under some trees in the church-yard, over against his house, where he and his family lived for a week. One day having gotten a few eggs, he picked up some rotten wood and dry sticks, and with these made a fire in the church-porch in order to boil them; but some of his adversaries, to show how far they could carry their rage against the church, for this poor man was so harmless they could have none against him, came and kicked about his fire, threw down his skillet, and broke his eggs. After this, having still a little money, he made a small purchase in that neighbourhood, built

him

Alpheus ||
Alphonfus. him a house, and lived there some years. He was encouraged to this by a presbyterian minister who came in his room, who honestly paid him the fifth part of the annual income of the living, which was the allowance made by parliament to ejected ministers, treated him with great humanity, and did him all the services in his power. It is a great misfortune that this gentleman's name is not preserved, his conduct in this respect being the more laudable, because it was not a little singular. Afterwards, probably on the death or removal of this gentleman, Mr Alphery left Huntingdonshire, and came and resided at Hammermith till the Restoration put him in possession of his living again. He returned on this occasion to Huntingdonshire, where he did not stay long; for being upwards of 80, and withal very infirm, he could not perform the duties of his function. Having, therefore, settled a curate, he retired to his eldest son's house at Hammermith, where shortly after he died, full of years and of honour.

ALPHEUS, (Strabo); **ALPHEIUS**, (Ptolemy); a noted and large river of the Peleponnesus; which, rising in, and after several windings running through, Arcadia, and by Olympia in Elis, with a south-west course, pours into the Sinus Chelonites, about ten miles to the south of Olympia. It has a common spring with the Eurotas, at the foot of mount Parthenius, near the village Afea, (Strabo.) The Alpheus and Eurotas mix and run together for 20 stadia; after which, they enter a subterraneous passage at Mantinea; then again emerge, the Eurotas in Laconica, and the Alpheus in the territory of Megalopolis, (Pausanias.) The poets fable strange things of this river; particularly, that, out of love to the nymph *Arethusa*, it runs under the sea to Sicily, and bursts out at the fountain of that name in Syracuse, (Virgil.) Its waters were reckoned good in the leprosy, which is called *Αλφειος* by the Greeks; and hence the name *Alpheus*.—Pausanias adds, that the Eleans had a law, which condemned any woman to death that should either appear at the Olympic games, or even cross this river during that solemnity: and the Eleans add, that the only woman who transgressed it, had disguised herself in the habit of a master or keeper of these games, and conducted her son thither; but when she saw him come off victorious, her joy made her forget her disguise, so that her sex was discovered. She was pardoned, but from that time a law was made that the keepers should appear there naked.

ALPHONSIN, in surgery, an instrument for extracting bullets out of gun-shot wounds. This instrument derives its name from the inventor Alphonfus Ferrer, a physician of Naples. It consists of three branches, which are closed by a ring. When closed and introduced into the wound, the operator draws back the ring towards the handle, upon which the branches opening take hold of the ball; and then the ring is pushed from the haft, by which means the branches push the ball so firmly, as to extract it from the wound.

ALPHONSUS X. king of Leon and Castile, furnished the Wife, was author of the astronomical tables called *Alphonfine*. Reading of Quintus Curtius gave him such delight, that it recovered him out of a dangerous illness. He read the Bible fourteen times, with several comments on it. He is said to have found fault with the structure of the mundane system, and has been

charged with impiety on that score; but unjustly, for he only found fault with the involved system of some astronomers. He was dethroned by his son Sancho; and died of grief, A. D. 1284.

ALPINI (Prospero), a famous physician and botanist, born in the Venetian territory, in 1553. He travelled in Egypt to acquire a knowledge of exotic plants, and was the first who explained the fructification and generation of plants by the sexual system. Upon his return to Venice, in 1586, Andrea Doria, prince of Meli, appointed him his physician: and he distinguished himself so much in this capacity, that he was esteemed the first physician of his age. The republic of Venice began to be uneasy, that a subject of theirs, of so great merit as Alpini, should continue at Genoa, when he might be of so much service and honour to their state: they therefore recalled him in 1593, to fill the professorship of botany at Padua; and he had a salary of 200 florins, which was afterwards raised to 750. He discharged this office with great reputation; but his health became very precarious, having been much broke by the voyages he had made. According to the register of the university of Padua, he died the 5th of February 1617, in the 64th year of his age; and was buried the day after, without any funeral pomp, in the church of St Anthony.—Alpini wrote the following works in Latin: 1. Of the physic of the Egyptians, in four books. Printed at Venice, 1591, in 4^{to}. 2. A treatise concerning the plants of Egypt. Printed at Venice, 1592, in 4^{to}. 3. A dialogue concerning balsams. Printed at Venice, 1592, in 4^{to}. 4. Seven books concerning the method of forming a judgment of the life or death of patients. Printed at Venice, 1691, in 4^{to}. 5. Thirteen Books concerning methodical Physic. Padua, 1611, folio; Leyden, 1719, in 4^{to}. 6. A Disputation held in the school at Padua, concerning the Raphonticum. Padua, 1612, and 1629, 4^{to}. 7. Of exotic plants, in two books. Venice, 1699, in 4^{to}. He left several other works, which have never been printed; particularly, 8. The fifth book concerning the physic of the Egyptians. 9. Five books concerning the natural history of things observed in Egypt, adorned with a variety of draughts of plants, stones, and animals.

ALPINIA, in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the 8th order, *Scitamineæ*. The characters are: The *calyx* is a perianthium above, small, and trifid: The *corolla* is monopetalous, unequal, and as if doubled: The *filamina* consist of one filament, with linear antheræ joining to the margin: The *pisillum* has a roundish germen, beneath; the *stylus* simple, and the *stigma* obtusely trigonous: The *pericarpium* is a fleshy ovate trilobular capsule, with three valves: The *seeds* are ovate, and very numerous; the *receptaculum* is pulpy and very large. Of this genus there is but one species, which is a native of the West Indies, where it grows naturally in moist places. The leaves decay every winter, and are pushed out from the roots in the spring, like the ginger and maranta; so must be managed in the same manner as directed for these two plants, and may be propagated by parting the roots when the leaves decay.

Alpiste,
Alps.

ALPISTE, or **ALPIA**, a sort of seed used to feed birds with, especially when they are to be nourished for breeding. The alpiste seed is of an oval figure, of a pale yellow, inclining to an isabel colour, bright and glossy. It is an article of the corn-chandlers and seedsmen's trade.

ALPS (anc. geog.), a range of high mountains, separating Italy from Gaul and Germany, in the form of a crescent. They take their rise from the *Vada Sabatia*, or *Savona*; and reach to the *Sinus Flanaticus* (now *Golfo di Carnaro* of the *Adriatic*), and the springs of the river *Colapis* (now the *Kulpe*); extending, according to *Livy*, 2000 stadia in length, or 250 miles: they are divided into several parts, and accordingly have different names. From *Savona* to the springs of the *Varus*, where the Alps lie against the sea of *Genoa*, they are called *Maritimæ*, now *le Montagne di Tenda*. These extend from south to north, between Gaul to the west, and *Genoa* to the east, beginning at *Monaco* on the *Mediterranean*; then running out thro' the east of the county of *Nice*, and between that and the marquisate of *Saluzzo*, terminate at length at mount *Viso*, between *Dauphine* and *Piedmont*. Hence to *Susa* run the *Alpes Cottie* (*Sueton.*); *Cottanæ* (*Tacitus*); mountains extremely high, separating *Dauphine* from *Piedmont*, and extending from mount *Viso* to *Mount Cenis*, between the *Alpes Maritimæ* to the south, and the *Graie* to the north. The *Alpes Graie* (*Pliny*), so called from the passage of *Hercules*, begin from mount *Cenis*, where the *Cottie* terminate; and run out between *Savoy* and the *Tarentese* to the west, and *Piedmont* and the *Duche d'Aouste* to the east, quite to the *Great St Bernard*, where the *Alpes Penninæ* begin. They are also called by some *Graie Alpes*, and *Graius Mons* (*Tacitus*); which extend from west to east, between *St Bernard* and the *Adula*, or *St Godart*; and thus they run out between the *Valese* to the north, and the *Milanese* to the south. With these are continued the *Alpes Rheticæ*, to the head of the river *Piave*; a part of which are the *Alpes Tridentinæ*, to the north of *Trent*. To these join the *Alpes Noricæ*, reaching to *Doblach* in *Tyrol*, to the north of the river *Tajamento*: thence begin the *Alpes Carnicæ*, or of *Carniola*, extending to the springs of the *Save*: and the last, called *Alpes Pannonicæ*, and *Julicæ*, extend to the springs of the *Kulpe*. Some, however, extend the Alps to the north of *Dalmatia*; others, again, to *Thrace* and the *Euxine*. But their termination at the *Kulpe*, as above, is more generally received. They were formerly called *Albia*, and *Alpionia* (*Strabo*). Through these mountains *Hannibal* forced his passage into *Italy*, by pouring vinegar on the rock, heated by burning large piles of wood on them, by which means they became crumbled (*Livy*). They are covered with perpetual snow.

The **ALPS** are the highest mountains in Europe; being, according to some geometricians, about two miles in perpendicular height. They begin at the *Mediterranean*; and stretching northward, separate *Piedmont* and *Savoy* from the adjacent countries; whence directing their course to the east, they form the boundary between *Switzerland* and *Italy*, and terminate near the extremity of the *Adriatic Sea*, north-east of *Venice*. It was over the western part of those mountains, towards *Piedmont*, that *Hannibal* forced his passage into *Italy*.

Alps.

The prospect from many parts of this enormous range of mountains is extremely romantic, especially towards the north-west. One of the most celebrated is the *Grande Chartreuse*, where is a monastery founded by *St Bruno* about the year 1084. From *Echelles*, a little village in the mountains of *Savoy*, to the top of the *Chartreuse*, the distance is six miles. Along this course, the road runs winding up, for the most part not six feet broad. On one hand is the rock, with woods of pine trees hanging over head; on the other a prodigious precipice almost perpendicular; at the bottom of which rolls a torrent, that, sometimes tumbling among the fragments of stone which have fallen from on high, and sometimes precipitating itself down vast descents with a noise like thunder, rendered yet more tremendous by the echo from the mountains on each side, concurs to form one of the most solemn, the most romantic, and most astonishing scenes in nature. To this description may be added the strange views made by the craggs and cliffs, and the numerous cascades which throw themselves from the very summit down into the vale. On the top of the mountain is the convent of *St Bruno*, which is the superior of the whole order. The inhabitants consist of 100 fathers, with 300 servants, who grind their corn, press their wine, and perform every domestic office, even to the making of their clothes. In the *Album* of the fathers is admired an *alcaic ode*, written by the late ingenious *Mr Gray* when he visited the *Chartreuse*, and which has since been published among his works.

The glaciers of *Savoy* are also justly reckoned among the most stupendous works of nature. These are immense masses of ice, lodged upon the gentler declivities amidst the Alps, and exhibiting representations beyond conception fantastic and picturesque. In the extraordinary narrative of *Mr Bourrit's* journey hither, we meet with the following account of the *Prieuré*, in the valley of *Chamouni*. We had, says he, the magnificent prospect of a chain of mountains, equally inaccessible, and covered with ice; and above the rest that of *Mount Blanc*, whose top seemed to reach, and even pierce, the highest region of the clouds. The chain upon which this mountain looks down like a giant, is composed of masses of rocks, which terminate in pikes or spires, called the *Needles*, and which are ranged like tents in a camp. Their sides appear lighter and more airy, from the ornament of several hollow breaks and furrows fretted in the rock itself, as well as from the different streaks and panes of ice and snow, which, without changing the general character of their form, or the majesty of their appearance, give them a picturesque variety. Lower down, the eye surveys with rapture the gills of ice, and the several glaciers, extending almost into the plain, whilst this appears like an artificial garden, embellished with the mixture of a variety of colours. We have a picturesque opposition to this chain, which is formed by innumerable mountains at the distance of near 50 leagues, between whose tops we have a glimpse of those several plains which they environ.

M. de Sauffure, who had visited those mountains about two months before *M. Bourrit*, felt himself naturally electrified in this place. This extraordinary phenomenon seems not to have been experienced by the latter or his company; but they heard a long-con-

tinued

Alps.

tinued rumbling noise, like that of thunder, which was rendered more awful by the silence of the place where they stood. This noise proceeded from the frequent causes, viz. the avalanches of snow, which separated from the tops of the mountains, and rolled down to the bottom; considerable fragments of the rocks which followed them, overturning others in their fall; and massy blocks of ice, which precipitated from the summits.

The valley of Montanvert appears to be peculiarly romantic. Here, says M. Bourrit, we beheld a spacious icy plain entirely level. Upon this there rose a mountain all of ice, with steps ascending to the top, which seemed the throne of some divinity. It likewise took the form of a grand cascade, whose figure was beyond conception beautiful; and the sun, which shone upon it, gave a sparkling brilliance to the whole. The valley on our right hand was ornamented with prodigious glaciers, that, shooting up to an immeasurable height between the mountains, blend their colours with the skies, which they appear to reach.

ALPS, besides its proper signification, by which it denotes a certain chain of mountains which separate Italy from France and Germany, is frequently used as an appellative to denote any mountains of extraordinary height or extensive range. In this sense, Aufonius and others call the Pyrenean mountains, *Alps*; and Gellius the Spanish Alps, *Alpini Hispani*.

Hence also we say, the *British Alps*, the *Asiatic Alps*, the *Alps of America*.

The *Scottish Alps* terminate in a most sublime and abrupt manner, at the great promontory the *Alta Ripa* of Ptolemy, the *Ord* or *Aird*, i. e. the *Height, of Caithness*. The upper part is covered with gloomy heath; the lower is a stupendous precipice, excavated into vast caverns, the haunt of seals and different sea-fowl. On the eastern side of the kingdom, this is the striking termination of the vast mountains of Scotland which form its Highlands, the habitation of the original inhabitants, driven from their ancient seats by the ancestors of Lowland Scots, descendants of Saxons, French, and Normans; congenerous with the English, yet absurdly and invidiously distinguished from them. Language, as well as striking natural boundaries, mark their place. Their mountains face on the west the Atlantic ocean; wind along the west of Caithness; among which Morvern and Scaraben, Ben-Hop and Ben-Lugal, arise pre-eminent. Sutherland is entirely Alpine, as are Rosshire and Invernesshire. Their *Summa Alps* are, Meal Fourvounich, the Coryarich, Benewish, and Benevish near Fort William; the last of which is reported to be 1450 yards in height. Great part of Aberdeenshire lies in this tract. It boasts of another Morvern, soaring far beyond the others. This is in the centre of the Grampian hills, and perhaps the highest from the sea of any in Great Britain. They again comprehend the eastern part of Perthshire, and finish on the magnificent shores of Lochlomond; on the western side of which Benlomond rises, distinguished among its fellows. From hence the rest of North Britain forms a chain of humbler hills; but in Cumberland, part of Westmoreland, Yorkshire, Lancashire, and Derbyshire, the Alps resume their former majesty. A long and tame interval succeeds. The long sublime tract of Wales arises, the ancient possession of the ancient British race. From the

Ord, the great mountains recede inland, and leave a vast flat between their bases and the sea, fronting the waves with a series of lofty rocky precipices, as far as the little creek of Staxigo; the whole a bold, but most inhospitable shore for shipping. Wick and Staxigo have indeed their creeks, or rather chasms, which open between the cliffs, and may accidentally prove a retreat, unless in an eastern gale.

The *Asiatic Alps* are described under the articles *ALTAIC Chain* and *WERTURIAN Mountains*.

The *American Alps* are, The *ANDES* or *Cordilleras*, in South America; and the *APALACHIAN* or *Allegany* mountains, in North America.

The highest ground in North America is placed by Captain Carver in lat. 47° west long. from Lond. 98° between a lake from which the Oregon flows, and another called *White-bear Lake*, from which arises the Mississippi.

This exalted situation is part of the Shining Mountains, which are branches of the vast chain which pervades the whole continent of America. It may be fairly taken from the southern extremity, where Staten Land and Terra del Fuego rise out of the sea as insulated links to an immense height, black, rocky, and marked with rugged spiry tops, frequently covered with snow. New Georgia may be added as another horribly congenial, rising detached farther to the east. The mountains about the Straits of Magellan soar to an amazing height, and infinitely superior to those of the northern hemisphere under the same degree of latitude. From the north side of the Straits of Magellan, they form a continued chain through the kingdoms of Chili and Peru, preserving a course not remote from the Pacific Ocean. The summits, in many places, are the highest in the world. There are not less than 12, which are from 2400 toises high to above 3000. Pichincha, which impends over Quito, is about 35 leagues from the sea; and its summit is 2430 toises above the surface of the water. Cayambé, immediately under the equator, is above 3000; and Chimborazo higher than the last by 200. Most of them have been volcanic, and in different ages marked with eruptions far more horrible than have been known in other quarters of the globe. They extend from the equator through Chili; in which kingdom is a range of volcanoes, from lat. 26. south, to 45. 30. and possibly from thence into Terra del Fuego itself; which, forming the Straits of Magellan, may have been rent from the continent by some great convulsion, occasioned by their labourings; and New Georgia forced up from the same cause. An unparalleled extent of plain appears on their eastern side. The river of Amazon runs along a level clothed with forests, after it bursts from its confinement at the Pongo of Borjas, till it reaches its sea-like discharge into the Atlantic Ocean.

In the northern hemisphere, the Andes pass through the narrow Isthmus of Darien into the kingdom of Mexico, and preserve a majestic height and their volcanic disposition. The mountain Popocatepec made a violent eruption during the expedition of Cortez, which is most beautifully described by his historian Antonio de Solis. This, possibly, is the same with the volcano observed by the Abbé d'Auroche, in his way from Vera Cruz to Mexico; which, from the nakedness of the lavas, he conjectured to have been but late-

Alps.

ly extinguished. From the kingdom of Mexico, this chain is continued northward, and to the east of California; then verges so greatly towards the west, as to leave a very inconsiderable space between it and the Pacific Ocean; and frequently detached branches jut into the sea, and form promontories; which, with parts of the chain itself, were often seen by our navigators in the course of their voyage. Some branches, as we have before observed, extend towards the east, but not to any great distance. A plain, rich in woods and savannas, swarming with bisons or buffaloes, stags, and Virginian deer, with bears, and great variety of game, occupies an amazing tract, from the great lakes of Canada, as low as the Gulph of Mexico; and eastward to the other great chain of mountains, the Apalachian, which are the Alps of that side of northern America. Its commencement is supposed to be about Lake Champlain and Lake George, with branches pointing obliquely to the river St Laurence eastward, and rising on its opposite coasts; others extending, with lowering progress, even into our poor remnant of the new world, Nova Scotia. The main chain passes through the province of New York, where it is distinguished by the name of the *Highlands*, and lies within 40 miles of the Atlantic. From thence it recedes from the sea, in proportion as it advances southward; and near its extremity in South Carolina is 300 miles distant from the water. It consists of several parallel ridges, divided by most enchanting vallies, and generally clothed with variety of woods. These ridges rise gradually from the east, one above the other, to the central; from which they gradually fall to the west, into the vast plains of the Mississippi. The middle ridge is of an enormous bulk and height. The whole extends in breadth about 70 miles; and in many places leaves great chasms for the discharge of the vast and numerous rivers which rise in the bosoms of the mountains, and empty themselves into the Atlantic Ocean, after yielding a matchless navigation to the provinces they water.

Beyond the branch of the Apalachian mountains called *The Endless*, is another of amazing extent, nearly as high as the mountains themselves. This plain (called the *Upper Plains*) is exceedingly rich land; begins at the Mohock's River; reaches to within a small distance of Lake Ontario; and to the westward forms part of the extensive plains of the Ohio, and reaches to an unknown distance beyond the Mississippi. Vast rivers take their rise, and fall to every point of the compass; into Lake Ontario, into Hudson's River, and into the Delawar and Susquehanna. The tide of the Hudson's River flows thro' its deep-worn bed far up, even to within a small distance of the head of the Delawar; which, after a furious course down a long descent, interrupted with rapids, meets the tide not very remote from its discharge into the ocean.

ALPUXARRAS, or ALPAXARES, mountains of Spain, in the province of Granada, on the coast of the Mediterranean sea. They are about 17 leagues in length, and 11 in breadth, reaching from the city of Velez to Almeria. They are inhabited by Moors, who are the remains of the dispersion and ruin of their empire. They embraced the Christian religion; but preserve their own manner of living, and their language,

though much corrupted. Here is a rivulet between Pitros and Portugos, which dyes linen that is dipped in it black in an instant. Near this rivulet is a cavern, from which proceeds so malignant a steam, that it destroys such animals as come near it. The Moriscos cultivate the soil extremely well, and plant fruit-trees; some of which grow to a prodigious height and thickness, and give the mountains a very agreeable aspect.

ALQUIER, a liquid measure, used in Portugal to measure oil, two of which make an almond. See ALMOND.

ALQUIFOU, or ARQUIFOU, is a sort of lead-ore, which, when broken, looks like antimony. It is used by the potters to give a green varnish to their works, and thence is called potter's ore. It is met with in Cornwall, &c. The potters mix a small portion of manganese with the alquifou, and then the varnish or glazing on their ware is of a blackish hue.

ALREDUS, ALURED, or ALUREDUS, of Beverley, one of the most ancient and best English historians. He wrote in the reign of Henry I. There are no circumstances of his life known with any degree of certainty. It is generally believed that he was educated at Cambridge, and that he afterwards became one of the canons and treasurer of St John's at Beverley. And we learn in a note of bishop Tanner's, that, for the sake of improvement, he travelled through France and Italy; and that at Rome he became domestic chaplain to cardinal Othoboni. He died in the year 1128 or 1129; leaving behind him the following works: 1. *The Annals of Alured of Beverley*. Oxford, 1726. Published by Mr Hearne, from a manuscript belonging to Thomas Rawlinson, Esq. It contains an abridgment of our history from Brutus to Henry I. written in good Latin; and with great accuracy. 2. *Libertates ecclesie S. Johannis de Beverlac*, &c. a manuscript in the Cotton library. It is a collection of records relative to the church at Beverley, translated by our author from the Saxon language. The Biographia Britannica evidently proves these to be all that were written by Alredus.

ALRESFORD, a town of Hampshire, seated on the road from London to Southampton, close by the river Itching, which feeds a great pond to the left of the town. Part of a Roman highway runs from hence to Alton. It is a rectory, with the mediety of Old Alresford, of L. 49: 12: 8 in the king's books. It consists of about 200 houses; has one church; two principal streets, which are large and broad; and a small manufacture of linseys.

ALSA, a river of Carniola (Pliny), now the *Aufa*; running by Aquileia, with a short course from north to south, into the Adriatic; where Constantine, the son of Constantine the Great, fighting against Constans his brother, lost his life.

ALSACE, a province of France, bounded on the east by the Rhine, on the south by Swisserland, on the west by Lorraine, and on the north by the palatinate of the Rhine. It was formerly a part of Germany, but was given to France by the treaty of Munster. It is one of the most fruitful and plentiful provinces of Europe, abounding in corn, wine, wood, flax, tobacco, pulse, fruits, &c. The mountains which divide it from Lorraine are very high; and generally covered with fir, beech, oak, and horn-beam. Those on the side of Swisserland are less high; and furnished with all sorts of wood,

Alps,
Alpuxarras.

Alquier
Alface.

Alfen
||
Alfine.

wood, as well for fuel as building. The country itself is diversified with rising hills and fertile vales, besides large forests; but that between the rivers Ill, H. rt, and the Rhine, as far as Strasburgh, is inferior to the rest, on account of the frequent overflowing of the Rhine. In High Alface there are mines of silver, copper, and lead. They however work none but those of Giromany, from which are annually drawn 1600 marks of silver, each mark being eight ounces; and 24,000 pounds of copper: but the expence of working them is almost equal to the profit. There are iron-works in several parts of Alface, and particularly at Betford. There is a mineral spring at Sultzbach, near Munster, in High Alface; which is in great reputation for the palsy, weakness of the nerves, and the gravel.—The original inhabitants of Alface are honest and good-natured, but wedded to their own manners and customs. The fruitfulness of their country renders them indolent and inactive; for the Swifs make their hay and reap their corn, as well as manage the vintage of High Alface, which sends a great deal of money out of the province. The common language is the German: however, the better sort of people speak French in the towns; and even in the country, they speak French well enough to be understood.

ALSEN, an island of Denmark in the lesser Belt, or-entrance into the Baltic sea, between Sleswick and Funen. It is remarkable for nothing except two castles, and producing large crops of aniseeds, a carminative much used in seasoning the food and mixing with the bread all over the Danish dominions. E. Long. 10. 12. N. Lat. 55. 12.

ALSFIELD, a town of Germany, in the landgrate of Hesse Cassel, ten miles north-west of Marburg, and 35 south of Hesse Cassel. It is an ancient town, and well-built; and the inhabitants were the first of this country who embraced the Reformation. E. Long. 9. 5. N. Lat. 50. 40.

ALSHASH, a very beautiful city in Bukharia, supposed to be the same with that which is now called *Tashcant*, the capital of the eastern part of Turkestan, possessed by the Kassats. It is situated on the river *Sibiran*, now *Sir*, and had a well-watered garden for every house; but was ruined by Jenghiz Khan, who took the city, and caused a great number of its inhabitants to be massacred.

ALSHEDA, a parish of Sweden, in the province of Smaland, where a gold mine was discovered in 1738.

ALSINA, in botany, a synonyme of the theligonum. See THELIGONUM.

ALSINASTRUM, in botany, the trivial name and also a synonyme of the elatine. See ELATINE.

ALSINE, or CHICKWEED: A genus of the trigynia order, belonging to the pentandria class of plants; and, in the natural method, ranking under the 22d order, *Caryophyllei*. The characters are: The *calyx* is quinquephyllous: The *corolla* consists of five equal petals, longer than the calyx: The *stamina* consist of five capillary filaments; the antheræ are roundish: The *perispermium* has an oval germen, three filiform styli, and obtuse stigmata: The *pericarpium* is an ovate unilocular capsule, with three valves: The *seeds* are roundish and numerous. Of this genus a great number of species are enumerated by some botanical writers; but none

of them possess any remarkable properties, except the media, or common chickweed, with white blossoms, which is so well known as to need no particular description.—This species affords a notable instance of what is called the *sleep of plants*: for, every night, the leaves approach in pairs, so as to include within their upper surfaces the tender rudiments of the new shoots; and the uppermost pair but one at the end of the stalk are furnished with longer leaf-stalks than the others; so that they can close upon the terminating pair, and protect the end of the branch. The young shoots and leaves, when boiled, can hardly be distinguished from spring spinach. They are deemed refrigerating and nutritive, and an excellent food for persons of a consumptive habit of body.—Swine are extremely fond of chickweed; cows and horses eat it; sheep are indifferent to it; and goats refuse it.

ALSIRAT, in the Mahometan theology, denotes a bridge laid over the middle of hell, finer than a hair, and sharper than the edge of a sword, over which people are to pass, after their trial, on the day of judgement. To add to the difficulty of the passage, Mahomet assures, that the alsirat, narrow as it is, is beset with briars and thorns; none of which, however, will be any impediment to the good, who shall fly over it like the wind; Mahomet and his mussulmen lead the way; whereas the wicked, by the narrowness of the path, the entangling of the thorns, and extinction of the light which directed the former to paradise, will soon miss their footing, and tumble headlong into hell, which is gaping beneath to receive them.

ALSIUM, a city of ancient Etruria, occupying (according to Cluverius) the spot on which *Pala* now stands. We are told by Dionysius Halicarnassensis, that Alsium was built by the Aborigines, long before the Tyrsenians invaded Italy. In this case it must have been founded not long after the dispersion in the days of Peleg. Its founder is said to have been one *Alesus*, *Alesus*, or *Alisa*; whom some conjecture to have been Alifah, or Elisha, the son of Javan, mentioned in scripture.

ALSOP (Anthony), a divine and poet, was educated at Westminster-school, and thence elected to Christ-church, Oxford, where he took the degree of M. A. in March 1696, and of B. D. in Decem. 1706. On his coming to the university, he was very soon distinguished by Dean Aldrich, and published *Fabularum Æsopicarum Delectus*, Oxon. 1698, 8vo. with a poetical dedication to lord viscount Scudamore, and a preface in which he took part against Dr Bentley in the famous dispute with Mr Boyle. He passed through the usual offices in his college to that of censor with considerable reputation; and for some years had the principal noblemen and gentlemen belonging to the society committed to his care. In this employment he continued till his merit recommended him to Sir Jonathan Trclavney, bishop of Winchester, who appointed him his chaplain, and soon after gave him a prebend in his own cathedral, together with the rectory of Brightwell in the county of Berks, which afforded him ample provision for a learned retirement, from which he could not be drawn by the repeated solicitations of those who thought him qualified for a more public character and a higher station. In 1717 an action was brought against him by Mrs Elizabeth Astrey of Oxford, for a breach

Alsirat
||
Altop.

Alfop. breach of a marriage-contract; and a verdict obtained against him for 2000l. which probably occasioned him to leave the kingdom for some time. His death, which happened June 10, 1726, was occasioned by his falling into a ditch that led to his garden-door. A quarto volume was published in 1752, under the title of *Antourii Alfopi, Ædis Christi olim Alumui Odarum libri duo*. Four English poems of his are in Doddsley's Collection, one in Pearch's, several in the early volumes of the Gentleman's Magazine, and some in "The Student." Mr Alfop is respectfully mentioned by the facetious Dr King of the Commons (vol. I. p. 236), as having enriched the commonwealth of learning, by "Translations of Fables from Greek, Hebrew, and Arabic;" and not less detractingly by Dr Bentley, under the name of "Tony Alfop, a late editor of the Æsopian Fables."

ALSOPI (Vincent), an eminent divine, was educated in St John's college in Cambridge, where he took the degree of Master of Arts. He received deacon's orders from a bishop, after which he went down into Rutlandshire, and settled at Oakham, where he was an assistant to the master of the free-school. As he was a man of a sprightly turn, he fell there into indifferent company; but was reclaimed by the frequent admonitions of the reverend Mr Benjamin King. He afterwards married that gentleman's daughter, and becoming a convert to his principles, received ordination in the Presbyterian way, not being satisfied with that which he had from the bishop. He was settled at Wilbee in the county of Northampton, whence he was ejected in 1662, for nonconformity. After this he ventured to preach sometimes at Oakham, and at Wellingborough where he lived, and was once six months in prison for praying by a sick person. A book he wrote against Dr Sherlock in a humorous style, made him well known to the world, and induced Mr Cawton, an eminent nonconformist in Westminster, to recommend him to his congregation for his successor. On receiving this call, he quitted Northamptonshire and came to London, where he preached constantly, and wrote several pieces which were extremely well received by the public. His living in the neighbourhood of the court exposed him to many inconveniences; but these ended with the reign of Charles II. or at least in the beginning of the next reign, when Mr Alfop's son engaging in treasonable practices was freely pardoned by king James. After this our divine went frequently to court, and is generally supposed to have been the person who drew the Presbyterian's address to that prince for his general indulgence. After the Revolution, Mr Alfop gave very public testimonies of his affection for the government; yet upon all occasions he spoke very respectfully of king James, and retained a very high sense of his clemency in sparing his only son. The remainder of his life he spent in the exercise of his ministry, preaching once every Lord's day; besides which he had a Thursday lecture, and was one of the lecturers at Pinner's hall. He lived to be a very old man, and preserved his spirits to the last. On grave subjects he wrote with a becoming seriousness; but where wit might properly be shown, he displayed his to great advantage. His funeral sermon was preached by Mr Slater, and his memory will be always preserved by his own learned

N^o 13.

and elegant writings. Of these the most remarkable, besides his sermons, are, 1. *Antifozzo*; in vindication of some great truths opposed by Dr William Sherlock, 8vo, 1675. 2. *Melius Inquirendum*; in answer to Dr Goodman's Compassionate Inquiry, 8vo, 1679. 3. The Mischief of Impositions; in answer to Dr Stillingfleet's Mischief of Separation, 1680. 4. A Faithful Re-proof to a False Report, with reference to the Differences among the United Ministers in London, 8vo.

ALSTEDIUS (John-Henry), a German Protestant divine, and one of the most indefatigable writers of the 17th century. He was some time professor of philosophy and divinity at Herborn in the county of Nassau: from thence he went into Transylvania, to be professor at Alba Julia; where he continued till his death, which happened in 1638, being then 50 years of age. His *Encyclopedia* has been much esteemed even by the Roman Catholics; it was printed at Lyons, and sold very well throughout all France. His *Theaurus Chronologicus* is by some esteemed one of his best works, and has gone through several editions. He also wrote *Triumphus Biblicus*, to show that the principles of all arts and sciences are to be found in the Scriptures; but he gained very few to his opinion. He was a Millennarian; and published, in 1627, a treatise *De mille annis*, in which he asserted that the reign of the saints on earth was to begin in 1694.

ALSTON-MORE, a town in Cumberland, seated on a hill, at the bottom of which runs the river Tyne, with a stone bridge over it. Near this place is plenty of lead-ore. W. Long, 2. 4. N. Lat. 54. 45.

ALSTONIA, in botany; a genus of the monogynia order, belonging to the hexandria class of plants. The characters are: The *calyx* is a perianthium beneath, imbricated: The *corolla* is monopetalous, and shorter than the calyx; the border expanding, eight or ten parted, with alternate divisions: The *stamina* consist of numerous short filaments, the exterior ones longer; the antheræ are orbicular and furrowed: The *pistillum* has a small ovate germen above; a simple stylus the length of the corolla, filiform and erect; the stigma inverse egg-headed. There is but one species, the theaformis, a native of America.

ALSTROEMERIA, in botany: A genus of the monogynia order belonging to the hexandria class of plants; and, in the natural method, ranking under the 11th order, *Sarmentaceæ*. The characters are: There is no *calyx*: The *corolla* is nearly bilabiated; and consists of six petals, the two inferior tubular at the base: The *stamina* consist of six subulated filaments, declining and unequal; the antheræ oblong: The *pistillum* has an hexangular germen beneath; the stylus declining, filiform, the length of the stamina; and three oblong bifid stigmata: The *pericarpium* is a roundish hexangular capsule, with three cells and three valves: The *seeds* are globular and numerous. There are five species, natives of Italy and Peru.

ALT, in music, a term applied to the high notes in the scale.

ALTAIC CHAIN, a range of mountains which bounds Asia on the south. It begins at the vast mountain Bogdo, passes above the head of the Irtysh, and then takes a course rugged, precipitous, clothed with snow, and rich in minerals, between the Irtysh and

Ob;

Altamont Ob; then proceeds by the lake Telezkoi, the rise of the Ob; after which it retires, in order to comprehend the great rivers which form the Jenefei, and are locked up in these high mountains; finally, under the name of the *Sainnes*, is uninterruptedly continued to the lake of Baikal. A branch insinuates itself between the sources of the rivers Onon and Ingoda, and those of Ichikoi; accompanied with very high mountains, running without interruption to the north-east, and dividing the river of Amur, which discharges itself into the east, in the Chinese dominions; from the river Lena and lake Baikal. Another branch stretches along the Olema, crosses the Lena below Jakoutsk, and is continued between the two rivers Tongoufska to the Jenefei, where it is lost in wooded and morassy plains. The principal chain, rugged with sharp-pointed rocks, approaches and keeps near the shores of the sea of Oekhozt, and passing by the sources of the rivers Outh, Aldan, and Maia, is distributed in small branches, which range between the eastern rivers which fall into the Icy Sea; besides two principal branches, one of which, turning south, runs through all Kamtschatka, and is broken, from the cape Lopatka, into the numerous Kurile idles, and to the east forms another marine chain, in the islands which range from Kamtschatka to America; most of them, as well as Kamtschatka itself, distinguished by fierce volcanoes, or the traces of volcanic fires. The last chain forms chiefly the great cape Tschutski, with its promontories and rocky broken shores.

ALTAMONT, a very handsome town of Italy, in the kingdom of Naples, and in Calabria Citerior, 15 miles north-west of Bassignano. E. Long. 16. 22. N. Lat. 39. 40.

ALTAMURA, a town of Naples, in the territory of Bari, with the title of a principality, seated on the foot of the Apennine mountains. E. Long. 16. 54. N. Lat. 41. 0.

ALTAR, a place upon which sacrifices were anciently offered to some deity.

The heathens at first made their altars only of turf; afterwards they were made of stone, of marble, of wood, and even of horn, as that of Apollo in Delos.

Altars differed in figure as well as in materials. Some were round, others square, and others triangular. All of them were turned towards the east, and stood lower than the statues of the gods; and were generally adorned with sculpture, representing either the gods to whom they were erected, or their symbols. See the **PAGAN ALTARS** represented on Plate XI. Upon the sides of N^o 1. a trident and two dolphins are exhibited, which denote it to have been dedicated to Neptune. N^o 2. a four-square altar, was dedicated to the nymphs, as the inscription imports. N^o 3. exhibits a Bacchanal holding a thyrsus in his hand, a mark of the altar's being built to Bacchus: it had two other sides, which made it appear triangular. Of N^o 4. which was also triangular, each face or side exhibited a genius, one of whom (on the side represented) carries an oar upon his neck, which seems to denote it an altar of Neptune. N^o 5. an altar of a round shape, is inscribed *Ara Neptuni*: the god himself is there represented, all-naked, saving the pallium upon his shoulder; and holding in his left hand a trident, and in his right a dolphin.

The height of altars also differed according to the

different gods to whom they sacrificed. According to Servius, those altars set apart for the honour of the celestial gods, and gods of the higher class, were placed on some pretty tall pile of building; and for that reason were called *altaria*, from the words *alta* and *ara*, "a high elevated altar." Those appointed for the terrestrial gods were laid on the surface of the earth, and called *are*. And, on the contrary, they dug into the earth and opened a pit for those of the infernal gods, which they called *βολβοι λακκοι*, "scrobiculi." But this distinction is not every where observed: the best authors frequently use *ara* as a general word, under which are included the altars of the celestial and infernal, as well as those of the terrestrial, gods. Witness Virgil, Ecl. 5.

—En quatwir aras.

Where *are* plainly includes *altaria*; for whatever we make of Daphnis, Phœbus was certainly a celestial god. So Cicero, pro Quint. *Aras delubraque Hecates in Græcia vidimus*. The Greeks also distinguished two sorts of altars; that whereon they sacrificed to the gods was called *βωμος*, and was a real altar, different from the other whereon they sacrificed to the heroes, which was smaller, and called *σχαρα*. Pollux makes this distinction of altars in his Onomasticon; he adds, however, that some poets used the word *σχαρα* for the altar whereon sacrifice was offered to the gods. The Septuagint version does sometimes also use the word *σχαρα* for a sort of little low altar, which may be expressed in Latin by *craticula*; being a hearth rather than an altar.

Before temples were in use, altars were erected sometimes in groves, sometimes in the highways, and sometimes on the tops of mountains; and it was a custom to engrave upon them the name, ensign, or character, of the deity to whom they were consecrated.

In the great temples of ancient Rome there were ordinarily three altars: The first was placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burnt and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

Besides these uses of altars, the ancients swore upon them, and swore by them, in making alliances, confirming treaties of peace, and other solemn occasions. Altars also served as places of refuge to all those who fled to them, whatever crime they had committed.

Altars are doubtless as ancient as sacrifices themselves; consequently their origin is not much later than that of the world; Gen. ch. iv. Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some carry them as far back as Adam, whose altar is much spoken of by Jewish, and even Christian writers. Others are contented to make the patriarch Enoch the first who consecrated a public altar. Be this as it will, the earliest altars we find any express testimony of are those erected by Abraham.

Altars, in the patriarchal times, were very rude. The altar which Jacob set up at Beth-el was nothing but a stone, which served him instead of a bolster; that of Gideon, a stone before his house: and the first which

Altar. God commanded Moses to erect was probably of earth, or unpolished stones, without any iron; for if any use was made of that metal, the altar was declared impure.

The principal altars of the Jews were, The altar of *incense*; that of *burnt-offering*; and the *altar*, or *table*, for the *shew-bread*.

The *altar of incense* was a small table of shittim-wood, covered with plates of gold, of one cubit in length, another in width, and two in height. At the four corners, were four kinds of horns, and all round a little border or crown over it. This was the altar hidden by Jeremias before the captivity; and upon it the officiating priest offered, every morning and evening, incense of a particular composition. See Plate XI.

The *altar of burnt-offerings* was made of shittim-wood, and carried upon the shoulders of the priests by slaves of the same wood overlaid with brass. In the time of Moses, this altar was five cubits square and three high; but in Solomon's temple it was much larger, being 20 cubits square and 10 in height. It was covered with brass; and at each corner was a horn or spire, wrought out of the same wood with the altar, to which the sacrifices were tied. Within the hollow was a grate of brass, on which the fire was made; through it fell the ashes, and were received in a pan below. At the four corners of the grate were four rings and four chains, which kept it up at the horns. This altar was placed in the open air, that the smoke of the burnt-offerings might not füll the inside of the tabernacle. See Plate XI.

The *altar*, or *table*, for the *shew-bread*, was likewise of shittim-wood, covered with plates of gold, having a little border round it, adorned with sculpture. It was two cubits long, one wide, and one and an half in height. Upon this table, which stood in the holy of holies, were put, every sabbath-day, 12 loaves, with salt and incense.

The Jewish altars, after their return from the captivity, and the building of the second temple, were in some respects different from those described above. That of burnt-offerings was a large pile, built of unhewn stone, 32 cubits square at the bottom, and 24 square at the top. The ascent was by a gentle rising, 32 cubits in length, and 16 in breadth.

ALTAR, is also used among Christians for the communion-table.

In the primitive church, the altars were only of wood; as being frequently to be removed from place to place. But the council of Paris, in 509, decreed that no altar should be built but of stone.—At first there was but one altar in each church; but the number soon increased; and from the writings of Gregory the Great, who lived in the sixth century, we learn, that there were sometimes in the same church 12 or 13. In the cathedral of Magdeburg there are no less than 49 altars.

The altar is sometimes sustained on a single column, as in the subterraneous chapels of St Cecilia, at Rome, &c.; and sometimes by four columns, as the altar of St Sebastian of Crypta Arenaria; but the customary form is, to be a massive of stone-work, sustaining the altar-table. These altars bear a resemblance to tombs:

to this purpose, we read in church-history, that the primitive Christians chiefly held their meeting at the tombs of the martyrs, and celebrated the mysteries of religion upon them; for which reason, it is a standing rule to this day in the church of Rome, never to build an altar, without inclosing the relics of some saint in it.

ALTAR-THANE, or ALTARIST, in old law-books, an appellation given to the priest or parson of a parish, to whom the altarage belonged. See ALTARAGE.

ALTARAGE, in law, altars erected in virtue of donations, before the Reformation, within a parochial church, for the purpose of singing of mass for deceased friends.

ALTARAGE likewise signifies the profits arising to the priest on account of the altar.

AL-TAYEFF, a town of Hejaz, a district of Arabia Felix. It is situated about 60 miles east of Mecca; behind mount Gazwan, where the cold is more intense than in any other part of the district, but the air very wholesome. Its territory abounds in fountains, and produces excellent raisins. The town is surrounded with a wall, but is not very large.

ALTDORF, a large handsome town in Swisserland, and the chief of the canton of Uri. It is situated below the lake of the four cantons, in a plain, at the foot of a mountain, whose passages are difficult, and serve instead of fortifications. It has four churches and two convents; St Martin's church and that of the Holy Cross are the finest. The town-house and the arsenal are also worth seeing. E. Long. 8. 30. N. Lat. 46. 50.

ALTEA, a sea-port town of Valencia, in Spain: It was taken in 1705, in favour of the archduke Charles; but lost after the battle of Almanza. W. Long. 0. 15. N. Lat. 46. 34.

ALTEMBURG, a town of Transylvania, 17 miles S. W. of Wisemburg, and 35 S. of Clausenbourg. E. Long. 23. 5. N. Lat. 46. 25.

ALTENA, a sea-port town of Germany, in the duchy of Holstein, in Lower Saxony. It is a modern town, built by the king of Denmark, and was burnt by the Swedes in 1712; but has since been beautifully re-built. The merchandize brought from Asia, by the Danish East-India company, is sold here. E. Long. 10. 0. N. Lat. 53. 51.

ALTENBERG, an ancient town of Germany, situated on the river Pleiss, with a good castle placed on a rock, in Misnia, in the circle of the Upper Saxony: It was formerly an Imperial city, but at present belongs to the house of Saxony. Here is a college which has always been in a flourishing condition. In 1705, there was a nunnery founded for women of a high rank, who are Protestants. E. Long. 15. 8. N. Lat. 50. 59.

ALTENBURG, a small fortified town of Hungary, in the territory of Moson, near the Danube, about 55 miles from Vienna. E. Long. 35. 30. N. Lat. 48. 15.

ALTENBURG, or OWAR, a small but strong town of Hungary, seated in a marsh, with wide streets. It is near the river Danube, and is surrounded with deep ditches. It is 15 miles south of Presburg, 40 south-east of Vienna, and 65 south-west of Buda. E. Long. 17. 56. N. Lat. 44. 0.

ALTE-

Alterants
||
Althæa.

Althæa.

ALTERANTS, or *ALTERATIVE Medicines*, such as correct the bad qualities of the blood and other humours, without occasioning any sensible evacuation.

ALTERATION, in physics, the act of changing the circumstances and manner of a thing; its general nature and appearance remaining the same. Or, it is an accidental and partial change in a body; without proceeding so far as to make the subject quite unknown, or to take a new denomination thereupon.—Or, it may be defined, the acquisition or loss of such qualities as are not essential to the form of the body. Thus, a piece of iron, which before was cold, is said to be *altered*, when it is made hot; since it may still be perceived to be iron, is called by that name, and has all the properties thereof. By this *alteration* is distinguished from *generation* and *corruption*; those terms expressing an acquisition or loss of the essential qualities of a thing.—The modern philosophers, after the ancient chemists and corpuscularians, hold all *alteration* to be effected by means of local motion. According to them, it always consists either in the emission, accession, union, separation, or transposition, of the component particles.

ALTERCATION, a debate or contest between two friends or acquaintance. The word comes from *altercari*, which anciently signified to converse or hold discourse together.—Thus, we say, They never come to an open quarrel, but there is continually some little *altercation* or other.

ALTERN-BASE, in trigonometry, a term used in contradistinction to the true base. Thus in oblique triangles, the true base is either the sum of the sides, and then the *difference* of the sides is called the *altern-base*; or the true base is the difference of the sides, and then the *sum* of the sides is called the *altern-base*.

ALTERNATE, in a general sense, a term applied to such persons or things as succeed each other by turns. Thus, two who command each his day, are said to have an alternate command, or to command alternately.

ALTERNATE, in heraldry, is said in respect of the situation of the quarters. Thus the first and fourth quarters, and the second and third, are usually of the same nature, and are called *alternate quarters*.

ALTERNATE, in botany, when the leaves or branches of plants arise/higher on opposite sides alternately.

ALTERNATION, in its primary sense, denotes a succession by turns.

ALTERNATION is sometimes used to express the different changes or alterations of orders in any number of things proposed. This is also called *permutation*, &c. and is easily found by a continual multiplication of all the numbers, beginning at unity. Thus, if it be required to know how many changes or alternations can be rung on six bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually into one another; and the last product gives the number of changes.

ALTERNATIVE, is particularly used for the choice of two things proposed. In this sense we say, to take the *alternative* of two propositions.

ALTHÆA, MARSHMALLOW: A genus of the polyandria order, belonging to the monodelphia class of plants; and, in the natural method, ranking under the 37th order, *Columniferae*. The characters are: The *calyx* is a double perianthium, the exterior one nine-cleft:

The *corolla* consists of five petals, coalesced at the base: The *stamina* consist of numerous filaments inserted into the corolla; the antheræ are kidney-shaped. The *perispermium* has an orbicular germen; a short cylindrical style; and numerous bristly stigmata, the length of the style: The *pericarpium* consists of numerous arillæ: The *seeds* are solitary, and kidney-shaped. There are three

Species. 1. The *vulgaris*, or common marshmallow, is a native of Britain, and hath a perennial root, and an annual stalk, which perishes every autumn. The stalks grow erect to the height of four or five feet. These are garnished with leaves which are hoary, soft to the touch, and placed alternately on the branches. The flowers come out from under the wings of the leaves, like the mallow, and are of a purplish white. 2. The *hirsuta*, or hairy marshmallow, is a native of Spain and Portugal. It is a low plant, whose branches trail on the ground, unless they are supported by stakes. The leaves and stalks are beset with strong hairs, the flowers come out like those of the common sort, but are smaller, and have purplish bottoms. 3. The *cannabina*, or shrubby marshmallow, is a native of Hungary and Itria. It has a woody stem, which rises to the height of four or five feet; and puts out many side-branches. The flowers come out in the same manner as in the others, but are of a deeper red colour. This sort seldom flowers the first year, unless the summer proves warm; but when the plants live through the winter, they will flower early in the following summer, and produce good seeds.

Culture. Though the first sort is found naturally in salt marshes, it will thrive when transplanted into any soil, or in any situation; however, it will always grow larger in moist than in dry soil. It may be propagated either by parting the roots in autumn when the stalks decay, or by sowing the seeds in the spring. If the seeds of the second species are sown in April, the plants will flower in July, and carry ripe seed in September. They ought to be sown in the places where they are to remain, as the roots shoot deep in the ground; so that unless the plants are removed very young, they seldom survive it. The seeds of the *cannabina* ought also to be sown where the plants are to remain, for the reason just now given. They should have a sheltered situation and a dry soil, otherwise they will not live through the winter. Indeed they seldom continue in this country above two years, with all the care that can be taken of them.

Medicinal Uses. The first is the only species used in medicine. The whole plant, especially the root, abounds with a mild mucilage. It has the general virtues of an emollient medicine; and proves serviceable in a thin acrimonious state of the juices, and where the natural mucus of the intestines is abraded. It is chiefly recommended in sharp fluxions upon the lungs, hoarseness, dysenteries; and likewise in nephritic and calculous complaints: not, as some have supposed, that this medicine has any peculiar power of dissolving or expelling the calculus; but as, by lubricating and relaxing the vessels, it procures a more free and easy passage. The root is sometimes employed externally for softening and maturing hard tumours; chewed, it is said to give ease in difficult dentition of children.

This root gave name to an officinal syrup, decoction,

Althæa
||
Alting.

tion, and ointment; and was likewise an ingredient in the compound powder of gum tragacanth and the oil and plaster of mucilages. But of all these formulæ the syrup alone is now retained.

ALTHÆA Frutex. See HIBISCUS.

ALTIMETRY, the art of measuring altitudes or heights, whether accessible or inaccessible. See GEOMETRY.

ALTIN, a money of account in Muscovy, worth three *copecks*; one hundred of which make a ruble, worth about 4s. 6d. sterling.

ALTIN, a lake in Siberia, from whence issues the river Ob, or Oby, in N. Lat. 52. 0. E. Long. 85°. 55'. This lake is called by the Russians *Telezkoï Ozer*, from the Telezzi, a Tartarian nation, who inhabit the borders of it, and who give it the name of *Alin-Kul*. By the Calmucks it is called *Altinor*. It is near ninety miles long and 50 broad, with a rocky bottom. The north part of it is sometimes frozen so hard as to be passable on foot, but the southern part is never covered with ice. The water in the Altin lake, as well as in the rivers which run through the adjacent places, only rises in the middle of summer, when the snows on the mountains are melted by the heat of the sun.

ALTINCAR, among mineralists, a species of facitious salt used in the fusion and purification of metals.

The altincar is a sort of flux powder. Divers ways of preparing it are given by Libavius.

ALTING (Henry), professor of divinity at Heidelberg and Groningen, was born at Embden in 1583, of a family which had been long conspicuous in Friseland. His father, Menso Alting, was the first, who, with two others, preached the reformation in the territory of Groningen, about the year 1566, under the tyrannical government of the duke of Alva; and the first that preached in the great church of Groningen, after the reduction of that town by the States General in 1594. Henry was chosen, in 1605, preceptor to the three young counts of Nassau, Solms, and Izenberg. After various difficulties, he settled at Groningen, where he continued till his death, August 25. 1644. He was a sound protestant divine, a pious Christian, a useful member of society in many respects, and one who suffered much for the truth. Most of his works were never published; those which have been are the following: *Notæ in decadem problematum J. Behm*, 1618. *Loci communes explicatio catecheseos Palatina*, 1646, in 3 vols. *Exegesis Augustanæ confes.* 1647. *Methodus theologiæ*, 1650. It appears from the catalogue of his works annexed to his life, that the *Medulla hist. profana*, published by Dr Pareus, was composed by Alting. The most remarkable piece among Alting's MMS. is, The ecclesiastical history of the Palatinate, from the reformation to the administration of John Casimir.

ALTING (James), son of the former, was born at Heidelberg in 1618. He travelled into England in 1640, where he was ordained by the learned Dr Prideaux, bishop of Worcester. He afterwards accepted of the professorship of Groningen, vacant by the death of Gomarus; but his situation was rendered very disagreeable by the continual disputes which he had with his colleague Sam. des Marets, who favoured the school-divinity. He died in 1697. He recommended the edition of his works to Menso Alting (author of *Notitia*

German. Infer. Antiquæ, fol. Amst. 1679); but they were published in 5 vols. folio, with his life, by Mr Bekker of Amsterdam. They contain various analytical, exegetical, practical, problematical, and philosophical tracts, which show his great industry and knowledge. Alting was a divine greatly addicted to the text of the scripture, to Cocceianism, and Rabbinism. He preached well in German, Dutch, and English.

ALTITUDE, accessible, and inaccessible. See GEOMETRY.

The method of taking considerable terrestrial altitudes, of which those of mountains are the greatest, by means of the barometer, is very easy and expeditious. It is done by observing, on the top of the mountain, how much the mercury has fallen below what it was at the foot of the mountain. See BAROMETER.

ALTITUDE of the Eye, in perspective, is a right line let fall from the eye, perpendicular to the geometrical plane.

ALTITUDE, in astronomy, is the distance of a star, or other point, in the mundane sphere, from the horizon.

This altitude may be either *true* or *apparent*.—If it be taken from the rational or real horizon, the altitude is said to be true or real; if from the apparent or sensible horizon, the altitude is apparent.—Or rather, the apparent altitude is such as it appears to our observation; and the *true* is that from which the refraction has been subtracted.

The true altitudes of the sun, fixed stars, and planets, differ but very little from their apparent altitudes; because of their great distance from the centre of the earth, and the smallness of the earth's semidiameter, when compared thereto. But the difference between the true and apparent altitude of the moon is about 52'. This subject is further explained under ASTRONOMY.

ALTITUDE Instrument, or Equal Altitude Instrument, is that used to observe a celestial object when it has the same altitude on the east and west sides of the meridian. See ASTRONOMY, the last section.

ALTKIRK, a town of Alsace in Germany, situated on the river Ill, in N. Lat. 47. 40. and E. Long. 7. 15.

ALTMORE, a town of Ireland, in the county of Tyrone, and province of Ulster, situated in N. Lat. 54. 34, and W. Long. 7. 2.

ALTON, a town in Hampshire, seated on the river Wey; W. Long. 0. 46. N. Lat. 51. 5. It is governed by a conitable; and consists of about 300 houses, indifferently built, chiefly laid out in one pretty broad street. It has one church, a Presbyterian, and a Quaker's meeting, a famous free school, a large manufacture of plain and figured baragons, ribbed druggets, and ferges de Nismes; and round the town is a large plantation of hops.

ALTON, or AVELTON, a village in Staffordshire, five miles north of Uttoxeter. There are the ruins of a castle here, which some would have to be built before the Norman conquest; but Dr Plott is pretty certain that it was erected by Theobald de Verdun, in the beginning of the reign of Edward II. A great part of the walls are still standing, but they are in a very ruinous condition.

ALTO *et Basso*, or in *ALTO & in Basso*, in law, signifies.

Altitude
||
Alto.

Alto. signifies the absolute reference of all differences, small and great, high and low, to some arbitrator or indifferent person.—*Pateat universis per presentes, quod Wilhelmus Tylar de Yetton, & Thomas Gower de Almesre, posuerunt se in Alto & in Basso, in arbitrio quatuor hominum; viz. de quadam querela pendente inter eos in curia.—Nos & terram nostram alte & basse ipsius domini Regis supposuimus voluntati.*

ALTO-Relievo. See RELIEVO.

ALTO-Ripieno, in music, the tenor of the great chorus which sings and plays only now and then in some particular places.

ALTORF, a town of the circle of Franconia, in Germany. It has a physic garden, with 2000 different plants; a theatre for dissections, which has many curiosities in the anatomical way; and a handsome library. It is subject to the house of Brandenburg; and is seated on the confines of Bavaria, 15 miles from Nuremberg. E. Long. 9. 35. N. Lat. 47. 46.

ALT-RANSTÄDT, a town in Saxony, famous for the treaty between Charles XII. king of Sweden and Augustus elector of Saxony, in 1706, wherein the latter resigned the kingdom of Poland.

ALTRINGHAM, a town of Cheshire in England, upon the borders of Lancashire, seven miles from Manchester. W. Long. 1. 30. N. Lat. 53. 25.

ALTZEG, a town of Germany in the Lower Palatinate, the capital of a territory of the same name, with an old castle. W. Long. 7. 25. N. Lat. 49. 44.

ALVA DE TORMES, a considerable town in Spain, in the kingdom of Leon, and territory of Salamanca, with a very handsome castle. It is seated on the north bank of the river Tormes. W. Long. 6. 1. N. Lat. 41. 0.

ALVAH, the wood wherewith Moses sweetened the waters of Marah, Exod. ch. xv. ver. 25.—The name of this wood is not found in scripture; but the Mahometans give it that of *alvab*, and pretend to trace its history from the patriarchs before the flood. Josephus, on the contrary, says, that Moses used the wood which he found next lying before him.

ALVARES DE LUNA, or as some call him **ALVARO**, is a character too edifying to be omitted in this work. He was the favourite of John II. king of Castile: was famous for the prodigious ascendancy he gained over this prince, and for the punishment which at length overtook him. He was natural son of Don Alvaro de Luna, lord of Canete in Arragon, and of a woman infamous for unbounded lust. He was born in 1388, and named Peter; but Pope Benedict XIII. who was charmed with his wit tho' yet a child, changed Peter to Alvares. He was introduced to court in 1408; and made a gentleman of the bedchamber to king John, with whom he grew into the highest favour. In 1427 he was obliged to retire: the courtiers exerted all their endeavours to ruin him: they complained, that a man of no military skill, of no virtues whatever, should, by mere artifice and dissimulation, be advanced to the highest authority; and they could not bear that, by the assistance of a few upstart men, whom he had raised and fixed to his interest, he should reign as absolutely as if he were king.

They prevailed against him, and Alvares was banished from court a year and an half: but this was the greatest affliction imaginable to the king; who show-

ed all marks of distress the moment he was removed from his presence, and now thought and spoke of nothing but Alvares. He was therefore recalled; and, being invested with his usual authority, revenged himself severely upon his enemies, by persuading the king to banish them. Of the 45 years he spent at court, he enjoyed for 30 of them so entire an ascendancy over the king, that nothing could be done without his express orders: nay, it is related by Mariana, that the king could not change an officer or servant, or even his clothes or diet, without the approbation of Alvares. In short, he wanted nothing to complete his grandeur but the name of king: he had all the places in the kingdom at his disposal; he was master of the treasury, and by bounties had so gained the hearts of the subjects, that the king, though his eyes now were opened, and his affections sufficiently turned against him, durst not complain.

But the day of reckoning was approaching, and at length he was seized; yet not directly, openly, and violently, but with some of that management which upon a similar occasion was formerly employed by Tiberius against Sejanus. During his confinement, he made several attempts to speak to the king in person; but not being able to effect this, he sent the following letter, from which, as well as from the rest of Alvares's history, all court favourites may draw abundant matter for edification and instruction. "Sir, it is five-
" and forty years since I was admitted into your ser-
" vice. I do not complain of the rewards I have re-
" ceived: they were greater than my merits or expect-
" tation, as I shall not deny. There was but one
" thing wanting to complete my happiness; and that
" was to have fixed proper limits in time to this great
" fortune of mine. While, instead of choosing retire-
" ment, after the example of the greatest men, I still
" continued in the employment, which I thought not
" only my duty, but necessary for your interest, I fell
" into this misfortune. It is very hard that I should
" be deprived of liberty, when I have risked life and
" fortune more than once to restore it to you. Grief
" prevents me from saying more. I know that the
" Deity is provoked against me by my sins; but it will
" be sufficient for me, if his anger is appeased by the
" calamities I now suffer. I can no longer bear that
" prodigious mass of riches, which it was wrong in
" me to have heaped together. I should willingly
" resign them, but that every thing I have is in your
" power; and I am denied the opportunity of showing
" mankind, that you have raised a person to the height
" of greatness, who can contemn wealth as well as pro-
" cure it, and give it back to him from whom he re-
" ceived it. But I desire you in the strongest terms,
" that, as I was obliged by the lowness of the trea-
" sury to raise 10,000 or 12,000 crowns by methods
" I ought not to have taken, you will restore them to
" the persons from whom they were extorted. If you
" will not grant this on account of the services I have
" done, yet I think it necessary to be done from the
" reason of the thing."

This letter, however, produced no effect in his favour: Alvares was tried, and condemned to lose his head. After condemnation, he was removed to Valladolid; and, having confessed himself, and received the sacra-
ment, he was carried upon a mule to the market-place,

Alvares.

Aludels
||
Alum.

in the middle of which a large scaffold was erected. Mounting the scaffold, he paid reverence to the cross, and presently gave his hat and signet to his page, saying, "These are the last gifts you will ever receive from me." He then submitted himself to the axe with the utmost intrepidity. Dr Geddes relates, that he was executed the 4th of June, others the 5th of July, 1453.

ALUDELS, in chemistry, are earthen pots without bottoms, inserted into each other, and used in sublimations.

ALVEARIUM, in anatomy, the bottom of the *concha*, or hollow of the outer ear.

ALVEARIUM also signifies a bee-hive. The word is formed of *alveus*, a "channel or cavity;" in allusion to the *alveoli*, or cells in bee-hives.

Some of the ancients use also the word *alvearium* for a bee-houfe, more usually called among us *apiary*.

ALVEARIUM is sometimes also used figuratively, to denote a collection. In which sense, *alvearium* amounts to much the same with what we otherwise call *thesaurus*, *cornucopia*, or the like. Vinc. Boreus has published an *alvearium* of law.

ALVEOLUS, in natural history, the name of the waxen cells in bee hives. Also the name of a sea-fossil of a conic figure, composed of a number of cells, like bee-hives, joined into each other, with a pipe of communication.

ALVEOLUS, in anatomy, the sockets in the jaws wherein the teeth are fixed.—Some writers speak of teeth growing without alveoli. Pliny mentions a person who had a tooth in his palate. Eustachius relates, that he saw a man who at 60 had a tooth growing out of the middle of his fauces. Holler gives an instance of a person, whose teeth were of a piece with his jaws, without any insertion into alveoli.

ALUM, in chemistry, a clear and transparent saline matter, usually sold in large masses, of a very austere and astringent taste, useful in medicine and in various arts.

Most of the alum to be met with is artificially prepared by the methods related in their proper place under the article CHEMISTRY, or by others similar to them; though sometimes a small quantity is produced naturally. This native alum is mixed with heterogeneous matters, or effloresces in various forms upon the ores during calcination. It rarely occurs in a crystallized state, though thus it is said to be met with in Egypt, Sardinia, Spain, Bohemia, and other places. It is also found in the waters, impregnated with fixed air, but very seldom in fountains or hot medicated waters.

There are several kinds of alum to be met with; but these differ from one another only in being mixed with some salts which are not of the aluminous kind. That called the Roman alum has been considered as preferable to any other. This is usually met with in small crystals, and has a reddish colour, most probably owing to a small quantity of calx of iron, which, however, does not in the least impair its qualities. The other kinds of alum contain a portion either of vitriolated tartar or sal ammoniac, according to the nature of the alkali used in its preparation. Mr Bergman informs us, that the vegetable alkali, if pure, does not hurt the alum, though it be added in the preparation; but that the volatile alkali, by adulterating it with a

portion of vitriolic sal ammoniac, renders it unfit for some purposes. The alum, made by adding a portion of clay to the liquor at the beginning of the boiling, he considers as equal, if not superior, to Roman alum. He informs us also, that a kind of alum some time ago began to be manufactured at Brunswick, which was equal in quality to the Roman alum. On a chemical analysis of this alum he found it mixed with cobalt.

This salt is extremely useful in the art of dyeing; as by means of it a great number of colours are fixed and rendered permanent upon cloth, which otherwise would either not adhere in any degree, or only for a very short time. In what manner this is accomplished we are very much ignorant; the conjectures and theories on this subject are related under the article DYEING. It constitutes the basis of crayons, which generally consist of the earth of alum finely powdered and tinged for the purpose. In the preparation of Prussian blue, it prevents the basis of martial vitriol, which is soluble in acids, from being precipitated by the superfluous alkali employed in the preparation of that pigment; that is, the alkali which is not saturated by the colouring matter. As this basis adheres more strongly than the clay to the vitriolic acid, and would form a green by the mixture of its yellowness, the white earth of alum likewise, according to its quantity, dilutes the darker colours, even black itself, and produces an infinite number of shades. It is also of use in the making of candles; for being mixed with the tallow, it gives it an hardness and consistence which it has not naturally. Wood sufficiently soaked in a solution of alum does not easily take fire, and the same is true of paper impregnated with it; which for that reason is very properly employed in preserving gun-powder, as it also excludes the moisture of the air. Paper impregnated with alum is useful in whitening silver, and silvering brass without heat. Alum is also of use in tanning, where it assists in restoring the cohesion of the skins almost entirely destroyed by the lime. Vintners fine down their wines, &c. with alum; fishers use it to dry codfish with; and bakers have mixed it with the flour to make their bread compact and white: to this last use of it great objections have been made, but unjustly, for it is entirely innocent, and now seldom used.

In medicine it is of considerable use as an astringent and tonic. It is reckoned particularly serviceable for restraining hemorrhagies, and immoderate secretions from the blood; but less proper in intestinal fluxes. In violent hemorrhagies, it may be given in doses of 15 or 20 grains, and repeated every hour or half hour till the bleeding abates: in other cases, smaller doses are more advisable; large ones being apt to nauseate the stomach, and occasion violent constipations of the bowels. It is used also externally, in astringent and repellent lotions and collyria. Burnt alum taken internally has been highly extolled in cases of colic. In such instances, when taken to the extent of a scruple for a dose, it has been said gently to move the belly, and give very great relief from the severe pain. Its officinal preparations are, for internal use, *pulvis stypticus*, and *aqua styptica* for external applications, the *aqua aluminis*, and *coagulum aluminis* and *alumen usum*; which last is no other than the alum dried by fire, or freed from the watery moisture, which, like other salts, it always retains in its crystalline form. By this

Alum.

Alum
Alyssum.

this loss of its water it becomes sharper, so as to act as a slight escharotic; and it is chiefly with this intention that it is employed in medicine, being very rarely taken internally. For these preparations, see PHARMACY.

Alum mines are said to have been first found in Italy in the year 1460; and in 1506 king Henry VII. made a monopolizing grant of this commodity to Augustine Chigi, a merchant of Sienna. In the year 1608 the manufacture of alum was first invented, and successively practised in England, meeting with great encouragement in Yorkshire, where it was first made, from Lord Sheffield, and other gentleman of that county. King James I. by advice of his ministry, assumed the monopoly of it to himself, and therefore prohibited the importation of foreign alum; and in 1625 the importation of it was further prohibited by the proclamation of Charles I.

Alum-works, places where alum is prepared, and manufactured in quantities for sale. They differ from alum-mines, as in the former an artificial alum, and in the latter natural alum, is produced.

ALUNTIUM, ALONTIUM, (anc. geog.) a town in the north of Sicily, situated on a steep eminence, at the mouth of the Chydas; said to be as old as the war of Troy. Now in ruins; from which arose the hamlet *St Filadelfo*, in the Val di Demona. The inhabitants were called *Haluntini*.

ALVUS, in anatomy, a term used for the belly in general, but more frequently applied to the bowels.

ALWAIDII, a sect of Mahometans who believe all great crimes to be unpardonable.—The Alwadii stand in opposition to the Morgii. They attribute less efficacy to the true belief in the salvation of men than the rest of the Musselmans.

ALYSSUM, ALLYSON, or ALLYSOIDES, Madwort; (from *αλυσσω*, to be mad; because it was believed to have the property of curing madness): A genus of the filiculosa order, belonging to the tetradynamia class of plants; and, in the natural method, ranking under the 39th order, *Siliquosa*. The characters are: The calyx is an oblong four-leav'd perianthium: The corolla consists of four cruciform petals; with claws the length of the calyx, the petals shorter: The stamina consist of six filaments, the length of the calyx, two of them rather shorter and denticulated; the antheræ are erect and expanding: The pistillum has an ovate germen; the stylus is simple, and the length of the stamina; the stigma is obtuse: The pericarpium is a sub-globular emarginated filicle, furnished with a bilocular stylus, having an elliptic partition: The seeds are few, orbicular, and affixed to filiform receptacles.

Species. Of this genus, Linnæus enumerates 19 species; but none of them are remarkable either for beauty, or any other property, except the halimifolium, or madwort, with whole spear-shaped leaves. This spreads itself upon the ground, and never rises to any height. It produces, at the extremity of its branches, very pretty tufts of small white flowers; of which it is seldom destitute for six or seven months successively; for which reason it well deserves a place in the gardens of the curious.

Culture. Though these plants are natives of the southern parts of Europe; yet, if planted on a dry, lean, or rubbishy soil, they will endure our severest win-

ters in the open air.—The halimifolium seldom continues above two or three years, and must therefore be often sown to preserve it; or if the seeds are suffered to fall, the plants will rise without any trouble. It may also be propagated by cuttings, which ought to be planted in April or May, and are very apt to take root, if kept shaded in the heat of the day, and gently refreshed with water.

This plant, as already observed, was thought to cure some kinds of madnes; but the present practice has entirely rejected it for this or any other purpose.

ALYTARCHA, a priest of Antioch in Syria, who, in the games instituted in honour of the gods, presided over the officers who carried rods to clear away the crowd and keep order.

In the Olympic games, the alytarches had the same command, and obliged every person to preserve order and decency.

ALZIRA, a town of Spain, in the kingdom of Valencia, seated on the river Xucar, E. Long. 0. 20. N. Lat. 39. 10.

AMA, in ecclesiastical writers, denotes a vessel wherein wine, water, or the like, were held, for the service of the eucharist. In this sense the word is also written amula; sometimes also hama, and hamula.

AMA is sometimes also used for a wine-measure, as a cask, pipe, or the like.

AMABYR, a barbarous custom which formerly prevailed in several parts of England and Wales, being a sum of money paid to the lord when a maid was married within his lordship. The word is old British, and signifies "the price of virginity."

AMADABAT, a corruption from AHMED ABAD, or *Ahmed's city* (so called from a king of that name); a large and populous city of Indostan, and the capital of the province of Guzerat. It is situated in E. Long. 72. 12. N. Lat. 23. 0. Amadabat was formerly called *Guzerat*; and by Shah Jehân nicknamed *Gherd-ab'id*, or "the habitation of dust," because it was much incommoded therewith. It was the seat of the Guzerat kings, as it is now of the Mogul governor. The city stands in a beautiful plain; and is watered by the little river Sabremetti, which, though not deep, in time of rains overflows the plains prodigiously. The walls are built with stone and brick, flanked at certain distances with great round towers and battlements. It has twelve gates; and, including the suburbs, is about four miles and an half long. The streets are wide. The *meydan shâh*, or king's square, is 700 paces long and 400 broad, planted round with trees. On the west side is the castle, well walled with free stone, and as spacious as a little city; but its inward appearance is not conformable to its external magnificence. The caravanserai is on the south of the square, and its chief ornament. Near the meydan also is the king's palace, whose apartments are richly ornamented: and in the midst of the city is the English factory, where they purchase fine chintz, calicoes, and other Indian merchandize. The place is so full of gardens stored with fruit-trees, that from an eminence it looks like a wood. The Hindoos have here an hospital for sick beasts, and another for sick birds, which they take great care of. According to some late accounts, this city is little inferior to the best in Europe, and is thought to yield ten times as much revenue as Surat.

AMADAN,

Alytarcha
Amadabat.

Amadan

Amak

AMADAN, or **HAMADAN**, a town of Persia, between Taurus and Ispahan, E. Long. 47. 4. N. Lat. 35. 15. It is seated at the foot of a mountain, where there are a great many springs, which water the adjacent country. The extent of the city is very large; but there are a great many waste spots within it, as well as cultivated land. The houses are built of brick hardened in the sun, and have but a very indifferent aspect. There is but one tolerable street; and that is where stuffs, garments, and the like, are exposed to sale: it is straight, long, and wide; and the shops are very well furnished. The adjacent parts are fruitful in corn and rice, inasmuch that the neighbouring provinces are supplied from hence. It is said to enjoy a very salubrious air, but the cold in winter is intense. The Armenians have a church in this town, but it is a very ill-contrived structure. The Jews have a synagogue near a tomb, where they pretend Esther and Mordecai lie interred. To this place they come in pilgrimage from several parts of the Levant. About a league from Amadan, there is a mountain called *Nalbana*, which abounds with all sorts of curious herbs. In the spring, people flock to this mountain from all parts to recover their health, by sucking in the salutary effluvia with their breath.

Amadan is a very ancient city. It is said to have been destroyed by Nebuchadnezzar, and rebuilt by Darius, who brought hither all his riches. The kings of Persia frequently retired to this place on account of its delightful situation; for which reason it obtained the name of the *Royal city*. It was conquered by the khalif Othman, and narrowly escaped being destroyed by Jenghiz Khan in 1220. It had then strong walls and a good castle, which are now in ruins. Its present beauty consists in its gardens and springs.

AMADANAGER, a town in the hither peninsula of India, in the province of Decan. E. Long. 74. 15. N. Lat. 18. 10.—It was taken by the Moguls in 1598, after a siege of six months; being at that time defended by a strong castle, situated on an eminence, and surrounded with deep ditches, into which several fountains discharged their waters.

AMADIA, a trading town of Asia, in Curdistan, belonging to the Turks; seated on a high mountain. E. Long. 43. 1. N. Lat. 36. 25.

AMADOW, a kind of black-match, tinder, or touch-wood, which comes from Germany. It is made of a sort of large mushrooms, or spongy excrescences, which commonly grow on old trees, especially oaks, ash, and firs. This substance being boiled in common water, and afterwards dried and well beaten, is then put into a strong lye prepared with salt-petre, after which it is again put to dry in an oven. The druggists sell this match wholesale in France, and several hawkers retail it. Some give to the amadow the name of *Pyrotechnical Spu-ge*, because of its aptness to take fire.

AMADOWRY, a kind of cotton which comes from Alexandria, by the way of Marseilles.

AMAIN, in the sea-language, a term importing to lower something at once. Thus, to *strike amain*, is to lower, or let fall, the top-sails; to *wave amain*, is to make a signal, by waving a drawn sword, or the like, as a demand that the enemy strike their top-sails.

AMAK, a small island in the Baltic sea, near Copenhagen, from which it is separated by a canal, N^o 13.

over which there is a draw-bridge. Amak is about four miles long and two broad; and is chiefly peopled by the descendants of a colony from East Friesland, to whom the island was assigned by Christian II. at the request of his wife Elizabeth, sister of Charles V. for the purpose of supplying her with vegetables, cheese, and butter. From the intermarriages of these colonies with the Danes, the present inhabitants are chiefly descended; but as they wear their own dress, and enjoy peculiar privileges, they appear a distinct race from the natives. The island contains about six villages, and between 3000 and 4000 souls. It has two churches, in which the ministers preach occasionally in Dutch and Danish. The inhabitants have their own inferior tribunals; but in capital offences are amenable to the king's court of justice at Copenhagen. The old national habit, brought by the original colony when they first migrated to the island, is still in use amongst them: It resembles the habit of the ancient quakers, as represented in the pictures of the Dutch and Flemish painters. The men wear broad-brimmed hats, black jackets, full glazed breeches of the same colour, loose at the knee, and tied round the waist. The women were dressed chiefly in black jackets and petticoats, with a piece of blue glazed cloth bound on their heads. The island is laid out in gardens and pastures; and still, according to the original design, supplies Copenhagen with milk, butter, and vegetables. E. Long. 12. 10. N. Lat. 55. 20.

AMAL, a town of Sweden, in the province of Dalarland, seated on the river Weser. It has a good harbour; and carries on a great trade, especially in timber, deals, and tar. E. Long. 12. 40. N. Lat. 58. 50.

AMALEK, the son of Eliphaz, by Timna his concubine, and the grandson of Esau. Gen. xxxvi. 12. and 1 Chr. i. 36. Amalek succeeded Gâtani in the government of Edom. He was the father of the Amalekites; a powerful people who dwelt in Arabia Petraea, between the Dead Sea and the Red Sea, or between Havila and Shur (1 Sam. xv. 7.); sometimes in one canton, and sometimes in another. It does not appear that they had cities: for there is no mention of any but one in the Scriptures (*id. ib. 5.*); they living generally in hamlets, caves, or tents.

The Israelites had scarce passed the Red Sea on their way to the wilderness, before the Amalekites came to attack them in the deserts of Raphidim (Ex. xvii. 8, &c.); and put those cruelly to the sword who were obliged, either through fatigue or weakness, to remain behind. Moses, by divine command, directed Joshua to fall upon this people; to record the act of inhumanity which they had committed in a book, in order to have it always before his eyes; and to revenge it in the most remarkable manner. Joshua therefore fell upon the Amalekites, and defeated them while Moses was upon the mountain, with Aaron and Hur in company. Moses, during the time of the engagement, held up his hands, to which the success of the battle was owing; for as often as he let them down, Amalek prevailed. But Moses's hands being tired, Aaron and Hur supported his arms, and held them extended; while the battle lasted, which was from morning till the approach of night, when the Amalekites were cut in pieces. This happened in the year of the world 2513, before Christ 1491.

Amal,
Amalek.

Amalek.

The ground of the enmity of the Amalekites against the Israelites is generally supposed to have been an innate hatred from the remembrance of Jacob's depriving their progenitor both of his birthright and blessing. Their falling upon them, however, and that without any provocation, when they saw them reduced to so low a condition by the fatigue of their march and the excessive drought they laboured under, was an inhuman action, and justly deserved the defeat which Joshua gave them. Under the Judges (v. 3.), we see the Amalekites united with the Midianites and Moabites, in a design to oppress Israel; but Elrud delivered the Israelites from Eglon king of the Moabites (Judges iii.), and Gideon (chap. viii.) delivered them from the Midianites and Amalekites. About the year of the world 2530, Saul marched against the Amalekites, advanced as far as their capital, and put all the people of the country to the sword; but spared the best of all the cattle and moveables, contrary to a divine command; which act of disobedience was the cause of Saul's future misfortunes.

After this war, the Amalekites scarce appear any more in history. However, about the year of the world 2949, a troop of Amalekites came and pillaged Ziklag, which belonged to David (1 Sam. xxx.), where he had left his two wives Ahinoam and Abigail; but he returning from an expedition which he had made in the company of Achish into the valley of Jezreel, pursued them, overtook and dispersed them, and recovered all the booty which they had carried off from Ziklag.

The Arabians maintain Amalek to have been the son of Ham and grandson of Noah; that he was the father of Ad and grandfather of Schedad. Calmet thinks that this opinion is by no means to be rejected; as it is not very probable that Amalek the son of Eliphaz, and grandson of Esau, should be the father of a people so powerful and numerous as the Amalekites were when the Israelites departed out of Egypt. Moses in the book of Genesis (xiv. 7.) relates, that in Abraham's time, long before the birth of Amalek the son of Eliphaz, the five confederate kings carried the war into Amalek's country, about Kadesh; and into that of the Amorites, about Hazezontamar. The same Moses (Numb. xxiv. 20.) relates, that the diviner Balaam, observing at a distance the land of Amalek, said, in his prophetic style, "Amalek is the first, the head, the original of the nations; but his latter end shall be that he perish for ever." Our commentator observes, that this epithet of the first of nations cannot certainly agree with the Amalekites descended from the son of Eliphaz, because the generation then living was but the third from Amalek. Besides, Moses never reproaches the Amalekites with attacking their brethren the Israelites; an aggravating circumstance which he would not have omitted were the Amalekites descended from Esau; in which case they had been the brethren of the Israelites. Lastly, We see the Amalekites almost always joined in the Scripture with the Canaanites and Philistines, and never with the Edomites; and when Saul made war upon the Amalekites, and almost utterly destroyed them, we do not find that the Edomites made the least motion towards their assistance, nor to revenge them afterwards. Thence it is thought probable, that the Amalekites who are so often mentioned in Scrip-

Vol. I. Part II.

ture were a free people descended from Canaan, and devoted to the curse as well as the other Amorites, and very different from the descendants of Amalek the grandson of Esau.

The accounts which the Arabians give us of the Amalekites destroyed by Saul are as follow. Amalek was the father of an ancient tribe in Arabia, exterminated in the reign of Saul. This tribe contained only the Arabians who are called *Pure*; the remains whereof were mingled with the posterity of Joktan and Adnan, and so became Mofarabes or Mostaarabes; that is to say, Arabians blended with foreign nations. They farther believe, that Goliath, who was overcome by David, was king of the Amalekites; and that the giants who inhabited Palestine in Joshua's time were of the same race. That at last part of the Amalekites retired into Afric while Joshua was yet living, and settled upon the coasts of Barbary, along the Mediterranean sea. The son of Amalek was Ad, a celebrated prince among the Arabians. Some make him the son of Uz, and grandson of Aram the son of Shem. Let this be as it will, the Mahometans say that Ad was the father of an Arabian tribe called *Adites*; who were exterminated, as they tell us, for not hearkening to the patriarch Eber, who preached the unity of God to them. Ad had two sons, Schedad and Schedid.

AMALFI, an ancient city of Italy, situated in E. Long. 15. 20. N. Lat. 40. 35.—It is said to have derived its origin from a number of Roman families, who, about the middle of the fourth century, either from private views of emolument, or in consequence of compulsory orders from the emperor, had left Rome and embarked for Constantinople; but meeting with storms on their passage, were cast away on the shores of Salerno, and deprived of the means of pursuing their voyage. In this state of perplexity they long remained, but at last came to the resolution of settling on the present site of Amalfi, where they expected to enjoy security and sufficient plenty of the necessaries of life. The earliest notice of them in this settlement dates no higher than the latter end of the sixth century. Impervious mountains and inaccessible coasts preserved their infant state from the first fury of the Lombards, who seldom attempted the conquest of a maritime people.

In the year 825, when this little republic had, under the patronage of the eastern emperors, attained a degree of wealth and reputation sufficient to excite the ambition of its neighbours, Sico, prince of Salerno, marched a body of troops by night; surprised Amalfi; and, carrying off the greatest part of the inhabitants, compelled them to fix at Salerno, which had lately suffered a great loss of people by an epidemical disorder. But before the fourth year of their captivity was expired, the Amalfitans took advantage of the absence of the Salernitan chiefs, who were then carrying on a war with the Beneventans; armed themselves; and, after burning and plundering Salerno, marched in triumph back to their own country.

Here they framed a better system of government, and reformed many abuses in their former legislation; adopting various measures that were likely to promote internal concord and defeat the evil intentions of foreign enemies. Their first plan was to vest the supreme authority in a temporary prefect; but the experience

3 T

of

Amalek,
Amalfi.

Amalfi
||
Amalgamation.

of a few years caused them to prefer lodging that power in the hands of a duke elected for the term of his natural life. Under these governors Amalfi attained the summit of her military and commercial glory. It extended its territory, which reached eastward from Vico Vecchio, and westward to the promontory of Minerva, including likewise the island of Caprea, and the two islands of the Galli. Towards the north it comprehended the cities of Lettere, Gragnans, Pimontio, and Capule di Franchi; towards the south, those of Scala, Ravelli, Minori, Majuri, Atrani, Tramonti, Agerula, Citara, Prajano, and Rosilano.

Leo IV. found the Amalfitans an useful ally in his wars with the infidels, and honoured the commonwealth with the title of *Defender of the Faith*. The Neapolitans, with whom, as Greek vassals, they were united in strict bonds of friendship, experienced many signal favours at their hands; and the Mussulmen themselves found it expedient to court their alliance, and to enter into treaty with them. Their situation had from the beginning given them a turn to commerce, and their attention to naval affairs so much consequence in the eyes of their protector, the emperor of Constantinople, that by his orders a court was established at Amalfi for the decision of all controversies arising in maritime transactions. Its code and reports became the general rule in those cases throughout this part of Europe; its precedents and decrees were allowed to be good authority to found judgment upon even in foreign tribunals.—To crown the mercantile and naval glory of the republic, it was reserved to the lot of an Amalfitan to make, or at least to perfect, the most important discovery ever made for the improvement of navigation. Pasitano, a village which stands on the shore a few miles west of Amalfi, boasts of having given birth to Flavius Gioia, the inventor of the mariner's compass.

The merchants of this town engrossed the trade of the Levant, and transacted the commercial business of the world in a lucrative and exclusive manner. The Pisans, Venetians, and Genoese, rose upon their ruin; and after monopolizing the emoluments of trade for some ages, made way for the more comprehensive and daring spirit of the present maritime powers.

At present Amalfi is subject to Naples, and is the see of an archbishop. It is but a shadow of what it was in its flourishing state, when it extended over the stupendous rocks that hang on each side, still crowned with battlemented walls and ruined towers. Its buildings, Mr Swinburne says, are not remarkable for elegance or size; and contain at most 4000 inhabitants, who seem to be in a poor line of life. The cathedral is an uncouth building. Under the choir is the chapel and tomb of the apostle St Andrew; in whose honour the edifice was dedicated, when Cardinal Capuano in 1208 brought his body from Constantinople.

AMALGAM, mercury united with some metal.

AMALGAMATION, the operation of making an amalgam, or mixing mercury with any metal.

For the combination of one metal with another, it is generally sufficient that one of them be in a state of fluidity. Mercury being always fluid, is therefore capable of amalgamation with other metals without

heat; nevertheless, heat considerably facilitates the operation.

To amalgamate without heat requires nothing more than rubbing the two metals together in a mortar; but the metal to be united with the mercury should be previously divided into very thin plates or grains. When heat is used (which is always most effectual, and with some metals indispensably necessary), the mercury should be heated till it begins to smoke, and the grains of metal made red-hot before they are thrown into it. If it be gold or silver, it is sufficient to stir the fluid with an iron rod for a little while, and then throw it into a vessel filled with water. This amalgam is used for gilding or silvering on copper, which is afterwards exposed to a degree of heat sufficient to evaporate the mercury.

Amalgamation with lead or tin is effected by pouring an equal weight of mercury into either of these metals in a state of fusion, and stirring with an iron rod. Copper amalgamates with great difficulty, and iron not at all.

AMALTHÆA, the name of the Cumæan Sibyl, who offered to Tarquinius Superbus nine books, containing the Roman destinies, and demanded 300 pieces of gold for them. He derided her; whereupon she threw three of them into the fire; and returning, asked the same price for the other six; which being denied, she burnt three more; and returned, still demanding the same price. Upon which Tarquin consulting the pontiffs, was advised to buy them. These books were in such esteem, that two magistrates were created to consult them upon extraordinary occasions.

AMALTHEA, in pagan mythology, the daughter of Melissus, king of Crete, and the nurse of Jupiter, whom she fed with goat's milk and honey. According to others, Amalthea was a goat, which Jupiter translated into the sky, with her two kids, and gave one of her horns to the daughters of Melissus, as a reward for the pains they had taken in attending him. This horn had the peculiar property of furnishing them with whatever they wished for; and was thence called the *cornucopia*, or horn of plenty.

AMALTHÆUS (Jerome, John Baptista, and Cornielle), three celebrated Latin poets of Italy, who flourished in the 16th century. Their compositions were printed at Amsterdam in 1685. One of the prettiest pieces in that collection is an epigram on two children, whose beauty was very extraordinary, though each of them was deprived of an eye:

' Lumine Acon dextro, capta est Leonilla sinistro;
' Et poterat forma vincere uterque deos.
' Parve puer, lumen quod habes concede forori;
' Sic tu cæcus Amor, sic erit illa Venus.'

AMAMA (Sixtinus), professor of the Hebrew tongue in the university of Franeker, a man of great learning, was born in Friesland, and had studied under Drusus. He published a criticism upon the translation of the Pentateuch; collated the Dutch translation of the Bible with the original and the most accurate translations; and wrote a censure of the Vulgate translation of the historical books of the Old Testament, Job, the Psalms, and Canticles. It is impossible to answer the reasons whereby he shows the necessity of consulting the originals.

Amalthæa
||
Amama.

Amance || *Amanicæ.*
 nals. This he recommended so earnestly, that some synods, being influenced by his reasons, decreed, that none should be admitted into the ministry but such as had a competent knowledge of the Hebrew and Greek text of the Scripture. He died in 1629.

AMANCE, a town in the duchy of Lorraine, upon a rivulet of the same name. E. Long. 6. 10. N. Lat. 48. 45.

AMAND (Mark-Anthony-Gerard, sieur de St.), a French poet, was born at Roan in Normandy in 1594. In the epistle dedicatory to the third part of his works, he tells us, that his father commanded a squadron of ships in the service of Elizabeth queen of England for 22 years, and that he was for three years prisoner in the Black Tower at Constantinople. He mentions also, that two brothers of his had been killed in an engagement against the Turks. His own life was spent in a continual succession of travels, which was of no advantage to his fortune. There are miscellaneous poems of this author, the greatest part of which are of the comic or burlesque, and the amorous kind. Though there are many blemishes in his poems, yet he had the talent of reading them in so agreeable a manner, that every one was charmed with them. In 1650, he published "Stances sur la grosseffe de la reine de Pologne et de Suede." There are six stanzas of nine verses each. In 1653, he printed his "Moïse fauve, idyle heroïque." This poem had at first many admirers: Mons. Chapelain called it a *speaking picture*; but it has since fallen into contempt. Amand wrote also a very devout piece, intitled "Stances à M. Corneille, sur son imitation de Jesus Christ," which was printed at Paris in 1656. Mr Broffette says that he wrote also a poem upon the moon, wherein he paid a compliment to Lewis XIV. upon his skill in swimming, in which he used often to exercise himself when he was young, in the river Seine; but the king could not bear this poem to be read to him, which is said to have affected the author to such a degree, that he did not survive it long. He died in 1661, being 67 years of age. He was admitted a member of the French academy, when it was first founded by cardinal Richlieu, in the year 1633, and Mr Pelisson informs us, that, in 1637, at his own desire, he was excused from the obligation of making a speech in his turn, on condition that he would compile the comic part of the dictionary which the academy had undertaken, and collect the burlesque terms. This was a task well suited to him; for it appears by his writings that he was extremely conversant in these terms, of which he seems to have made a complete collection from the markets and other places where the lower people resort.

AMAND (St.), a city of France, in Bourboinois, on the confines of Berry, seated upon the river Cher. It was built in 1410 on the ruins of Orval. E. Long. 3. 30. N. Lat. 46. 32.

AMAND (St.), a city of the Low Countries, in the earldom of Flanders, seated upon the river Scarpe. It contains about 600 houses, and 3000 or 4000 inhabitants. The abbot of the place is the temporal lord, and disposes of the magistracy. It was given to France by the treaty of Utrecht. E. Long. 2. 35. N. Lat. 50. 27.

AMANICÆ PYLÆ, (Ptolemy); AMANIDES PY-

LÆ, (Strabo); AMANI PORTÆ, (Pliny): straits or defiles in mount Amanus, through which Darius entered Cilicia; at a greater distance from the sea than the Pylæ Ciliciæ or Syriæ, through which Alexander passed.

AMANTEA, a sea-port town and bishop's see of the kingdom of Naples, situated near the bay of Euphemia in the province of Calabria, in E. Long. 16. 20. N. Lat. 39. 15.

AMANUS, a mountain of Syria, separating it from Cilicia; a branch of mount Taurus, (Cicero, Strabo, Pliny); extending chiefly eastward, from the sea of Cilicia, to the Euphrates: now called *Monte Negro*, or rather *Montagna Neres*, by the inhabitants; that is, the watery mountain, as abounding in springs and rivulets.

AMAPALLA, a city and port-town of North America, in the province of Guatimala, seated on the gulph of the same name, in the Pacific ocean. W. Long. 63. 20. N. Lat. 12. 30.

AMARANTE, an order of knighthood, instituted in Sweden by queen Christina, in 1653, at the close of an annual feast, celebrated in that country, called *Wirtschaft*. This feast was solemnized with entertainments, balls, masquerades, and the like diversions, and continued from evening till the next morning.—That princess, thinking the name too vulgar, changed it into that of the *feast of the gods*, in regard each person here represented some deity as it fell to his lot. The queen assumed the name of *Amarante*; that is, unfading, or immortal. The young nobility, dressed in the habit of nymphs and shepherds, served the gods at the table.—At the end of the feast, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the masques; and, in memory of so gallant a feast, founded a military order, called in Swedish *Ceschsellschaft*, into which all that had been present at the feast were admitted, including 16 lords and as many ladies, besides the queen. Their device was the cypher of *Amarants*, composed of two A's, the one erect, the other inverted, and interwoven together; the whole inclosed by a laurel crown, with this motto, *Dolce nella memoria*.

Bulltrode Whitlock, the English ambassador from Cromwell to the court of Sweden, was made a knight of the order of *Amarante*: on which account it seems to be, that we sometimes find him styled *Sir Bullstrode Whitlock*.

AMARANTHOIDES, in botany, the trivial name of a species of illecebrum. See ILLECEBRUM.

AMARANTHUS (of α privative, and $\mu\alpha\rho\alpha\iota\omega$, *to wither*, because the flower of this plant when cropped does not soon wither), AMARANTH, or FLOWER-GENTLE: A genus of the pentandria order, belonging to the monœcia class of plants; and, in the natural method, ranking under the 54th order, *Miscellaneæ*. The characters are: The *male calyx* is a five or three leav'd perianthium, erect, coloured, and persistent: There is no *corolla*: The *stamina* consist of five or three erect capillary filaments, the length of the calyx; the antheræ are oblong and versatile: The *female calyx* the same as the male, and no corolla: The *pistillum* has an ovate germen; the styli are three, short, and subulated; the stigmata simple and persistent: The *pericarpium* is

Amaranthus, Amaryllis. an ovate capsule, three-beaked, unilocular, and cut round: The *seed* is one, globular, compressed, and large.

Species. Of this genus Linnæus enumerates 19 species; the most remarkable of which are the following. 1. The tricolor, or three-coloured amaranthus. This has been long cultivated in gardens, on account of the beauty of its variegated leaves, which are of three colours, green, yellow, and red; and very elegantly mixed. When the plants are in full vigour, the leaves are large, and closely set from the bottom to the top of the stalks, and the branches form a sort of pyramid; so that there is not a more beautiful plant than this when it is in full lustre. 2. The melancholicus, bicolor, or two-coloured amaranthus. This greatly resembles the former in its manner of growth; but the leaves have only two colours, which are an obscure purple, and a bright crimson. These are so blended as to set off each other, and, when the plants are vigorous, make a fine appearance. 3. The caudata, with very long hanging cylindrical spikes. This species is a native of America. It hath an upright stem three feet high; the leaves and stalks are of a pale green colour. The spikes of flowers are produced from the wings of the stalks, and also at the extremities of the branches. They are of a bright purple colour, and hang downward, sometimes to the length of two feet and an half, so that many of them touch the ground. 4. The maximus, or tree-like amaranthus, grows with a strong stem, to the height of seven or eight feet. Towards the top it sends forth many horizontal branches, garnished with oblong rough green leaves. At the extremity of every shoot, the cylindrical spikes of flowers are produced. They are of a purple colour, and hang downward like the last; but are seldom half the length, tho' much thicker than the former. 5. The sanguineus, with compound spikes, and oblong oval leaves. This is a native of the Bahama islands. It is an esculent plant, and bears fine flowers. It grows to the height of three feet, with purple stalks and leaves. The spikes are short and cylindrical, of a bright purple at first, but afterwards fade to a darker colour. They are frequently produced from the wings of the stalks; but at the extremity of the stalk arises a large cluster of spikes, which are placed cross-wise, with one upright stalk in the middle. 6. The oleraceus, with obtuse indented leaves. This has no beauty; but it is used by the Indians as a substitute to cabbage.

Culture. The two first of these species being tender, require some art and care to bring them to perfection in Britain, by a succession of hot-bed, with proper waterings, airings, and shadings.

Where people are curious in having these annual plants in great perfection, there should be a glass-case erected, with upright and sloping glasses on every side, with a pit in the bottom for tan, in which the pots should be plunged. If this is raised eight or nine feet to the ridge, and the upright glasses are five feet, there will be room enough to raise these and other annual plants to great perfection; and in such a building, many tender vegetables, which rarely perfect their seeds in this climate, may be every year brought forward so as to ripen their seeds.

AMARYLLIS, LILY-ASPHEDEL: A genus of the

monogynia order, belonging to the hexandria class of Amaryllis. plants; and, in the natural method, ranking under the 9th order, *Spathaceæ*. The characters are: The *calyx* is an oblong obtuse spatula, emarginated, and withering: The *corolla* consists of six petals, lanced: The *stamina* consist of six subulated filaments; the antheræ oblong, incumbent, and ascending: The *pistillum* has a roundish fulcated germen beneath; a filiform stylus, nearly the length of the stamina; the stigma trifid and slender: The *pericarpium* is an ovate trilocular capsule, with three valves: The *seeds* are many.

Principal Species. 1. The lutea, or autumnal narcissus.

This is usually sold by gardeners, along with colchicums, for autumnal ornaments to gardens. For this purpose it is very proper, as it will keep flowering from the beginning of September to the middle of November, provided the frost is not so severe as to destroy the flowers. Although there is but one flower in each cover, yet there is a succession of flowers from the same root, especially when they are suffered to remain three or four years unremoved. The flowers seldom rise above three or four inches high. They are shaped somewhat like the flowers of the yellow crocus; the green leaves come up at the same time, like the saffron; and, after the flowers are past, the leaves increase all the winter. The roots are bulbous, and shaped like those of the narcissus; so are proper ornaments for such borders as are planted with cyclamens, saffron, autumnal crocus, colchicums, and such low autumnal flowers. 2. The formosissima, or jacobæa lily, produces its flowers two or three times in a year, without being regular to any season. The flowers are of a deep red, the under petals very large, and the whole flower stands nodding on one side of the stalk, making a beautiful appearance. The stems of these flowers are produced from the sides of the bulbs; so that when the flowers produced on one side are decayed, another stalk arises from the other side of the bulb; but there is no more than one flower produced on the same stalk. When the roots are in vigour, flowers will be produced from March to the beginning of September. 3. The farniensis, or Guernsey lily, is supposed to have come originally from Japan, but has been many years cultivated in the gardens of Guernsey and Jersey; in both which places they seem to thrive as well as if it was their native country, and from these islands their roots are sent annually to the curious in most parts of Europe. The flowers of this species are admired for the richness of their colour, which is commonly red, though they have no scent. They appear towards the end of September; and, if properly managed, will continue a month in beauty. The roots of these plants do not flower again the succeeding year, as is the case with many other bulbs: but if their bulbs contain two buds in their centre, which is often the case, they frequently flower twice in three years; after which the same individual root does not flower again in several years, but only the offsets from it. 4. The regina, or belladonna lily, is a native of Portugal, where it was formerly cultivated in great plenty; but of late it has been supplanted by the jacobæa lily, so that the roots which have been brought from that country for some time past for the belladonna, have generally proved the jacobæa lily. This kind, if properly managed, will sometimes put out two or three stems, growing near three.

Amaryllis, three feet high, and produce many flowers in each umbel, which make a fine appearance during the month of October. 5. The zeylanica, or Ceylon lily, is a native of the West Indies, and usually flowers in June. Sometimes the same root will flower again in autumn, but the flowers are of no long duration. 6. The orientalis, or lily daffodil, with leaves shaped like a tongue. This is a native of the Cape of Good Hope. The bulbs of the root are large and almost round; the leaves long, broad and rounded at their extremities; these spread two ways on the surface of the ground, and do not come up till after the flower-stem appears, which is generally in November. After the flowers are past, the leaves increase till spring, and in May they begin to decay; so that from the middle of June to October the roots are entirely destitute of leaves.

Culture. The first sort is very hardy, and will thrive in almost any soil or situation; but will succeed best in a fresh light dry soil, and not too near the dripping of trees, or too near walls. It increases very fast by offsets, by which all the other species are also to be propagated. These roots may be transplanted any time from May to the end of July; after which it will be too late to remove them.—The jacobæa ought to be kept in a moderate stove all winter; in which case it will send forth plenty of offsets, that will produce vigorous plants.—The roots of the Guernsey lily are generally brought over in June and July; but the sooner they are taken out of the ground after the leaves decay, the better: for altho' the roots which are taken up when their flower-stems begin to appear, will flower; yet their flowers will not be so large, nor will their roots be near so good after, as those which were removed before they sent forth fresh fibres. When these roots come over, they should be planted in pots filled with fresh; light, sandy earth, mixed with a little very rotten dung, and placed in a warm situation, observing now and then to refresh the earth with water: but by no means let them have too much wet, which would rot their roots, especially before they come up. About the middle of September, such of the roots as are strong enough to flower will begin to show the bud of their flower-stem: therefore these pots ought to be removed into a situation where they may have the benefit of the sun, and be sheltered from strong winds. When the flowers begin to open, the pots should be removed under shelter, to prevent injury from too much wet.—After the flowers are decayed, the green leaves will begin to shoot forth in length; and, if sheltered from severe cold, will continue growing all winter: but they must have as much free air as possible in mild weather, and are to be covered only in great rains or frosts. For this purpose, a common hot-bed frame is the most proper shelter for them; the glasses of which may be taken off every day in dry open weather, which will encourage the leaves to grow strong and broad. The roots should be transplanted every fourth or fifth year, toward the end of June or beginning of July; the offsets also should be taken off and planted in pots, where in three years time they will produce flowers. The other species of the amaryllis may easily be raised by taking care to shelter them in a stove from the winter's cold.

AMARYNTHUS (anc. geog.), a hamlet of Eretrias, in the island of Eubœa, about seven stadia distant from its walls. Here Diana was worshipped by an

annual solemnity, at which those of Carystus assisted; hence the title of the goddess was *Amarynthis*, and *Amarysia*.

Amasia
||
Amazonia.

AMASIA (anc. geog.), now *Marpurg*, a city in the landgraviate of Hesse, on the Lahn. According to others, it is Embden in Westphalia.

AMASIA, an ancient town of Turkey, in Natolia, remarkable for the birth of Strabo the geographer. It is the residence of a bashaw, and gives its name to the province it stands in, where there are the best wines and the best fruits in Natolia. It is seated near the river Iris or Cafalmack; and was anciently the residence of the kings of Cappadocia. E. Long. 36. 10. N. Lat. 39. 33.

AMASIA, the name of the northern division of Lesser Asia, lying on the south shore of the Euxine sea in Natolia. It takes its name from Amasia the capital, mentioned in the preceding article.

AMASONIA, in botany: A genus of the angiosperma order, belonging to the didynamia class of plants; the characters of which are: The *calyx* is a tripartite monoplyllous perianthium, bell-shaped and persistent: The *corolla* is monopetalous and tubular; the border quinquefid, expanding, and small: The *stamina* consist of four filaments longer than the corolla; the antheræ oval and incumbent: The *pisillum* has an ovate germen; the stylus the length of the stamina; the stigmata two, acute: There is no *pericarpium*: The *seed* is an ovate unilocular nut, the length of the calyx.

AMATHUS, a very ancient town in the south of Cyprus (Strabo, Ptolemy): so called from Amathus the founder; or, according to others, from Amath, a Phœnician town sacred to Venus, with a very ancient temple of Adonis and Venus: and hence Venus is denominated *Amathusia* (Tacitus). According to Ovid, it was a place rich in copper-ore, and where the inhabitants became *Cerastra*, or horned. Now called *Limisso*.

AMATHUS (anc. geog.), a town of the tribe of Gad, beyond Jordan; but whether at a greater or less distance from it, is not so easy to determine. Eusebius places it in the Lower Perœa; Reland, in Ramoth-Gilead. Gabinius, proconsul of Syria, established five juridical conventions in Judea; two of which were on the other side Jordan; one at Gadara, the other at Amathus (Josephus).

AMATORII MUSCULI, in anatomy, a term sometimes used for the obliquus superior and obliquus inferior muscles of the eye, as these muscles assist in ogling or drawing the eye sideways.

AMATRICE, a city of the kingdom of Naples, in the farther Abruzzo, upon the confines of the pope's territories, and the marquisate of Ancona.

AMAUROSIS, in medicine, a deprivation of sight, the eye remaining fair and seemingly unaffected. A perfect amaurosis is when the blindness is total; when there is still a power of distinguishing light from darkness, the disease is called by M. de St-Ives an *imperfect amaurosis*. There is a periodical sort which comes on instantaneously, continues for hours, or days, and then disappears. Mr Hey, surgeon at Leeds, mentions several cases of patients afflicted with the amaurosis who were relieved by being electrified.

AMAZONIA, or the country of the American A-

Amazonia. AMAZONS, is situate between 50 and 70 degrees of west longitude; and between the equator and 15 degrees of south latitude; being bounded on the south by La Plata, on the west by Peru, on the north by the province of Terra Firma, and on the east by Brazil.

With respect to the Amazons said to have given name to this territory, they have been represented as governed and led to war only by their queen. No men were suffered to live among them; though those of some neighbouring nations were suffered to visit them, at a certain season, for the sake of procreation. The females issuing from this commerce were bred up with care, and instructed in what relates to war and government; as to the males, they were sent away into the country of their fathers. But no such nation is at present to be found, any more than the giants and cannibals mentioned by the first adventurers thither.

Amazonia is generally a flat region, abounding in woods, lakes, rivers, bogs, and morasses. The chief river, and one of the largest in the world, is that called the river of Amazons, or the Orellana, which is formed by two large rivers, the one rising in the province of Quito, a little south of the equator, in 73 degrees of west longitude, and the other, named Xauxa, rising in the lake of Bourbon, near the Andes, in ten degrees of south latitude. Those two rivers uniting on the confines of Peru and Amazonia, in three degrees odd minutes of south latitude, assume the name of Amazon; whence running eastward upwards of 200 miles, and afterwards inclining to the north, they fall into the Atlantic ocean by 84 channels, which in the rainy season overflow the adjacent country. Besides the two streams mentioned, a multitude of others, both on the north and south side, contribute to the formation of this extraordinary river. As it runs almost across the broadest part of South America, it is computed to be between four and five thousand miles in length, including all its windings. Its channel from Junta de los Reyes, about 60 degrees from its head, to the river Maranhon, is from one to two leagues broad; it then widens from three to four, and becomes gradually broader as it approaches the ocean. Between the places last mentioned, its depth is from five to ten fathom; but from Maranhon to Rio Negro it increases to 20 fathom; after which it is sometimes 30, and sometimes 50 fathoms, or more, till it comes near the end of its course. It has no sand-banks, nor does the shore shelve so as to render it dangerous for vessels. The manetia and tortoise abound both upon the banks of this and the other rivers; and the fishermen must be upon their guard against the crocodiles, alligators, and water-serpents, which also swarm here.

The air, as in the countries under the same parallel, is observed to be nearly as cool under the equator as about the tropics, on account of the rains continuing longer, and the sky in that season being clouded. Besides, an easterly wind sets from the Atlantic up the river so strong, that vessels are carried by it against the stream.

The produce of the country is Indian corn and the cassavi root, of which they make flour and bread; tobacco, cotton, sugar, sarsaparilla, yams, potatoes, and other roots. They have also plenty of venison, fish, and fowl. Among the latter are vast flocks of parrots

of all colours, the flesh of which serves for food and the feathers for ornament. All the trees here are evergreens; and fruits, flowers, and herbage, are in perfection all the year round. The principal fruits are cocoa-nuts, ananas or pine-apples, guavas, bananas, and such others as are usually found between the tropics. The forest and timber trees are cedar, Brazil wood, oak, ebony, logwood, iron-wood, so called from its weight and hardness, and several sorts of dyeing wood.

The natives are of the common stature, with good features, a copper complexion, black eyes and hair. It is computed that there are of them about 150 different tribes or nations, and the villages are so numerous as to be within call of one another. Among those the Homagues, a people near the head of the river, are famous for their cotton manufactures; the Jurines, who live between five and ten degrees of latitude, for their joinersworks; and the Wrofflars for their earthen ware. The Topinambes, who inhabit a large island in the river, are remarkable for their strength. Some of those nations frequently make war upon each other. Their armour consists of darts, javelins, bows and arrows, and they wear targets of cane, or fish-skin. They make slaves of their prisoners, whom they otherwise use very well. Every tribe is governed by its respective chief or king, the marks of whose dignity are a crown of parrots feathers, a chain of lions teeth or claws hung round his neck, or girt about his waist, and a wooden sword, which he carries in his hand.

Most of those nations, except the Homagues, go naked. The men thrust pieces of cane through their ears and under-lips, as well as through the skin of the pudenda. At the gristle of their noses they also hang glass beads, which wag to and fro when they speak. They are such skilful marksmen, that they will shoot fish as they swim; and what they catch they eat without either bread or salt. They worship images, which they always carry with them on their expeditions; but they neither have temples nor any order of priests; and permit both polygamy and concubinage.

The country affords neither gold nor silver mines; only a small quantity of the former is found in the rivulets which fall into the Amazon near its sources in Peru. While the Spaniards imagined that it contained those metals, they made great efforts from Peru to reduce this territory to subjection; till being at length undeceived, they abandoned the design.

AMAZONS, in antiquity, a nation of female warriors, who founded an empire in Asia Minor, upon the river Thermodoon, along the coasts of the Black Sea. They are said to have formed a state out of which men were excluded. What commerce they had with that sex, was only with strangers; they killed all their male children; and they cut off the right breasts of their females, to make them more fit for the combat. From which last circumstance it is, that they are supposed to take their name, viz. from the privative *a*, and *μαστος*, *mamma*, "breast." But Dr Bryant, in his Analysis of Ancient Mythology, explodes this account as fabulous; and observes, that they were in general Cuthite colonies from Egypt and Syria, who formed settlements in different countries, and that they derived their name from *zon*, the "sun," which was the national object of worship. Vol. iii. p. 463.—It has indeed

Amazons. deed been controverted even among ancient writers, whether ever there really were such a nation as that of the Amazons. Strabo, Palæphatus, and others, deny it. On the contrary, Herodotus, Pausanius, Diodorus Siculus, Trogus Pompeius, Justin, Pliny, Mela, Plutarch, &c. expressly assert it.

M. Petit, a French physician, published a Latin dissertation in 1685, to prove that there was really a nation of Amazons; it contains abundance of curious inquiries, relating to their habit, their arms, the cities built by them, &c. Others of the moderns also maintain, that their existence is sufficiently proved by the testimony of such of the historians of antiquity as are most worthy of credit; by the monuments which many of them have mentioned; and by medals, some of which are still remaining; and that there is not the least room to believe that what is said of them is fabulous.

The Amazons are mentioned by the most ancient of the Greek writers. In the third book of the Iliad, Homer represents Priam speaking of himself as having been present, in the earlier part of his life, in a battle with the Amazons: and some of them afterwards came to the assistance of that prince during the siege of Troy.

The Amazons are particularly mentioned by Herodotus. That historian informs us, that the Grecians fought a battle with the Amazons on the river Thermodoon, and defeated them. After their victory, they carried off all the Amazons they could take alive, in three ships. But whilst they were out at sea, these Amazons conspired against the men, and killed them all. Having, however, no knowledge of navigation, nor any skill in the use of the rudder, sails, or oars, they were driven by wind and tide till they arrived at the precipices of the lake Mæotis, in the territories of the Scythians. Here the Amazons went ashore, and marching into the country, seized and mounted the first horses they met with, and began to plunder the inhabitants. The Scythians at first conceived them to be men; but after they had had skirmishes with them, and taken some prisoners, they discovered them to be women. They were then unwilling to carry on hostilities against them; and by degrees a number of the young Scythians formed connections with them, and were desirous that these gentle dames should live with them as wives, and be incorporated with the rest of the Scythians. The Amazons agreed to continue their connection with the Scythian husbands, but refused to associate with the rest of the inhabitants of the country, and especially with the women of it. They afterwards prevailed upon their husbands to retire to Sarmatia, where they settled. "Hence," says Herodotus, "the wives of the Sarmatians still continue their ancient way of living. They hunt on horseback in the company of their husbands, and sometimes alone. They march with their armies, and wear the same drefs with the men. The Sarmatians use the Scythian language, but corrupted from the beginning, because the Amazons never learned to speak correctly. Their marriages are attended with this circumstance: no virgin is permitted to marry till she has killed an enemy in the field; so that some always grow old before they can qualify themselves as the law requires."

Diodorus Siculus says, "There was formerly a nation, who dwelt near the river Thermodoon, which was

subjected to the government of women, and in which the women, like men, managed all the military affairs. Among these female warriors, it is said, was one who excelled the rest in strength and valour. She assembled together an army of women, whom she trained up in military discipline, and subdued some of the neighbouring nations. Afterwards, having by her valour increased her fame, she led her army against the rest; and being successful, she was so puffed up, that she styled herself the daughter of Mars, and ordered the men to spin wool, and do the work of the women within doors. She also made laws, by which the women were enjoined to go to the wars, and the men to be kept at home in a servile state, and employed in the meanest offices. They also debilitated the arms and thighs of those male children who were born to them, that they might be thereby rendered unfit for war. They feared the right breasts of their girls, that they might be no hinderance to them in fighting: from whence they derived the name of Amazons. Their queen, having become extremely eminent for skill and knowledge in military affairs, at length built a large city at the mouth of the river Thermodoon, and adorned it with a magnificent palace. In her enterprizes she exactly adhered to military discipline and good order; and she added to her empire all the adjoining nations, even to the river Tanais. Having performed these exploits, she at last ended her days like a hero, falling in a battle, in which she had fought courageously. She was succeeded in the kingdom by her daughter, who imitated the valour of her mother, and in some exploits excelled her. She caused the girls from their very infancy to be exercised in hunting, and to be daily trained up in military exercises. She instituted solemn festivals and sacrifices to Mars and Diana, which were named Tauropoli. She afterwards carried her arms beyond the river Tanais, and subdued all the people of those regions, even unto Thrace. Returning then with a great quantity of spoils into her own kingdom, she caused magnificent temples to be erected to the deities before mentioned; and she gained the love of her subjects by her mild and gentle government. She afterwards undertook an expedition against those who were on the other side of the river, and subjected to her dominion a great part of Asia, extending her arms as far as Syria."

Diodorus also mentions another race of Amazons who dwelt in Africa; and whom he speaks of as being of greater antiquity than those who lived near the river Thermodoon. "In the western parts of Lybia," says he, "upon the borders of those tracts that are habitable, there was anciently a nation under the government of women, and whose manners and mode of living were altogether different from ours. It was the custom for these women to manage all military affairs; and for a certain time, during which they preferred their virginity, they went out as soldiers into the field. After some years employed in this manner, when the time appointed for this purpose was expired, they associated themselves with men, in order to obtain children. But the magistracy, and all public offices, they kept entirely in their own hands. The men, as the women are with us, were employed in household affairs, submitting themselves wholly to the authority of their wives. They were not permitted to take any part in military

Amazons. military affairs, or to have any command, or any public authority, which might have any tendency to encourage them to cast off the yoke of their wives. As soon as any child was born, it was delivered to the father, to be fed with milk or such other food as was suitable to its age. If females were born, they scared their breasts, that they might not be burdensome to them when they grew up; for they considered them as great hindrances in fighting."

Justinian represents the Amazonian republic to have taken its rise in Scythia. The Scythians had a great part of Asia under their dominion upwards of 400 years, till they were conquered by Ninus, the founder of the Assyrian empire. After his death, which happened about 1150 years before the Christian æra, and that of Semiramis and their son Ninias, Ilinus and Scopolites, princes of the royal blood of Scythia, were driven from their country by other princes, who like them aspired to the crown. They departed with their wives, children, and friends; and being followed by a great number of young people of both sexes, they passed into Asiatic Sarmatia, beyond mount Camassus, where they formed an establishment, supplying themselves with the riches they wanted, by making excursions into the countries bordering on the Euxine Sea. The people of those countries, exasperated by the incursions of their new neighbours, united, surpris'd, and massacred the men.

The women then resolving to revenge their death, and at the same time to provide for their own security, resolv'd to form a new kind of government, to choose a queen, enact laws, and maintain themselves, without men, even against the men themselves. This design was not so very surpris'ing as at first sight appears: for the greatest number of the girls among the Scythians had been inured to the same exercises as the boys; to draw the bow, to throw the javelin, to manage other arms; to riding, hunting, and even the painful labours that seem reserv'd for men; and many of them, as among the Sarmatians, accompanied the men in war. Hence they had no sooner form'd their resolution, than they prepar'd to execute it, and exercis'd themselves in all military operations. They soon secur'd the peaceable possession of the country; and not content with showing their neighbours that all their efforts to drive them thence or subdue them were ineffectual, they made war upon them, and extended their own frontiers. They had hitherto made use of the instructions and assistance of a few men that remained in the country; but finding at length that they could stand their ground, and aggrandize themselves, without them, they killed all those whom flight or chance had sav'd from the fury of the Sarmatians, and for ever renounc'd marriage, which they now consider'd as an insupportable slavery. But as they could only secure the duration of their new kingdom by propagation, they made a law to go every year to the frontiers, to invite the men to come to them; to deliver themselves up to their embraces, without choice on their part, or the least attachment; and to leave them as soon as they were pregnant. All those whom age render'd fit for propagation, and were willing to serve the state by breeding girls, did not go at the same time in search of men: for in order to obtain a right to promote the multiplication of the species, they must first have contributed to its destruction;

Amazons. nor was any thought worthy of giving birth to children till she had killed three men.

If from this commerce they brought forth girls, they educated them; but with respect to the boys, if we may believe Justin, they strangled them at the moment of their birth: according to Diodorus Siculus, they twisted their legs and arms, so as to render them unfit for military exercises; but Quintus Curtius, Philostratus, and Jordanus, say, that the less savage sent them to their fathers. It is probable, that at first, when their fury against the men was carried to the greatest height, they killed the boys: that when this fury abated, and most of the mothers were fill'd with horror at depriving the little creatures of the lives they had just received from them, they fulfill'd the first duties of a mother; but, to prevent their causing a revolution in the state, maim'd them in such a manner as to render them incapable of war, and employ'd them in the mean offices which these warlike women thought beneath them: in short, that, when their conquests had confirm'd their power, their ferocity subsiding, they enter'd into political engagements with their neighbours; and the number of the males they had preserv'd becoming burthensome, they, at the desire of those who render'd them pregnant, sent them the boys, and continued still to keep the girls.

As soon as the age of the girls permitted, they took away the right breast, that they might draw the bow with the greater force. The common opinion is, that they burnt that breast, by applying to it, at eight years of age, a hot brazen instrument, which insensibly dried up the fibres and glands: some think that they did not make use of so much ceremony, but that when the part was form'd they got rid of it by amputation: some, again, with much greater probability, assert, that they employ'd no violent measures; but, by a continual compression of that part from infancy, prevent'd its growth, at least so far as to hinder its ever being incommodious in war.

Plutarch, treating of the Amazons in his life of Theseus, considers the accounts which had been preserv'd concerning them as partly fabulous and partly true. He gives some account of a battle which had been fought between the Athenians and the Amazons at Athens; and he relates some particulars of this battle which had been recorded by an ancient writer named Clidemus. He says, "That the left wing of the Amazons mov'd towards the place which is yet call'd Amazonium, and the right to a place call'd Pryx, near Chrysa; upon which the Athenians, issuing from behind the temple of the muses, fell upon them; and that this is true, the graves of those that were slain, to be seen in the streets that lead to the gate Piraica, by the temple of the hero Chalcoedus, are a sufficient proof. And here it was that the Athenians were routed, and shamefully turn'd their backs to women, as far as to the temple of the Furies. But fresh supplies coming in from Palladium, Ardetus, and Lyceum, charg'd their right wing, and beat them back into their very tents; in which action a great number of the Amazons were slain." In another place he says, "It appears that the passage of the Amazons through Thesaly was not without opposition; for there are yet to be seen many of their sepulchres near Scotufæa and Cynocephalæ." And in his life of Pompey, speaking of the

Amazons

the Amazons, Plutarch says, "They inhabit those parts of mount Caucasus that look towards the Hyrcanian sea (not bordering upon the Albanians, for the territories of the Getæ and the Leges lie betwixt): and with these people do they yearly, for two months only, accompany and cohabit, bed and board, near the river Thermoodon. After that they retire to their own habitations, and live alone all the rest of the year."

Quintus Curtius says, "The nation of the Amazons is situated upon the borders of Hyrcania, inhabiting the plains of Thermiscyra, near the river Thermoodon. Their queen was named Thalestris, and she had under her subjection all the country that lies between mount Caucasus and the river Phasis. This queen came out of her dominions, in consequence of an ardent desire she had conceived to see Alexander; and being advanced near the place where he was, she previously sent messengers to acquaint him, that the queen was come to have the satisfaction of seeing and conversing with him. Having obtained permission to visit him, she advanced with 300 of her Amazons, leaving the rest of her troops behind. As soon as she came within sight of the king, she leaped from her horse, holding two javelins in her right hand. The apparel of the Amazons does not cover all the body; for their left side is naked down to the stomach, nor do the skirts of their garments, which they tie up in a knot, reach below their knees. They preserve their left breast entire, that they may be able to suckle their female offspring; and they cut off and fear their right, that they may draw their bows, and cast their darts, with the greater ease. Thalestris looked at the king with an undaunted countenance, and narrowly examined his person; which did not, according to her ideas, come up to the fame of his great exploits: For the barbarians have a great veneration for a majestic person, esteeming those only to be capable of performing great actions, on whom nature has conferred a dignified appearance. The king having asked her whether she had any thing to desire of him, she replied, without scruple or hesitation, that she was come with a view to have children by him, she being worthy to bring him heirs to his dominions. Their offspring, if of the female sex, she would retain herself; and if of the male sex, it should be delivered to Alexander. He then asked her, whether she would accompany him in his wars? But this she declined, alleging, That she had left nobody to take care of her kingdom. She continued to solicit Alexander, that he would not send her back without conforming to her wishes; but it was not till after a delay of 13 days that he complied. She then returned to her own kingdom.

Justin also repeatedly mentions this visit of Thalestris to Alexander; and in one place he says, that she made a march of 25 days, in order to obtain this meeting with him. The interview between Alexander and Thalestris is likewise mentioned by Diodorus Siculus. The learned Goropius, as he is quoted by Dr Petit, laments, in very pathetic terms, the hard fate of Thalestris, who was obliged to travel so many miles, and to encounter many hardships, in order to procure this interview with the Macedonian prince; and, from the circumstances, is led to consider the whole account as incredible. But Dr Petit, with equal erudition, with equal eloquence, and with superior force of reasoning, at length determines, that her journey was not founded

Vol. I. Part II.

upon irrational principles, and that full credit is due to those grave and venerable historians by whom this transaction has been recorded.

The Amazons are represented as being armed with bows and arrows, with javelins, and also with an axe of a particular construction, which was denominated the axe of the Amazons. According to the elder Pliny, this axe was invented by Penthisilea, one of their queens. On many ancient medals are representations of the Amazons, armed with these axes. They are also said to have had bucklers in the shape of a half-moon.

The Amazons are mentioned by many other ancient authors besides those which have been enumerated; and if any credit be due to the accounts concerning them, they subsisted through several ages. They are represented as having rendered themselves extremely formidable; as having founded cities, enlarged the boundaries of their dominions, and conquered several other nations.

That at any period there should have been women, who, without the assistance of men, built cities and governed them, raised armies and commanded them; administered public affairs, and extended their dominion by arms, is undoubtedly so contrary to all that we have seen and known of human affairs, as to appear in a very great degree incredible; but that women may have existed sufficiently robust and sufficiently courageous to have engaged in warlike enterprises, and even to have been successful in them, is certainly not impossible, however contrary to the usual course of things. In support of this side of the question, it may be urged, that women who have been early trained to warlike exercises, to hunting, and to an hard and laborious mode of living, may be rendered more strong, and capable of more vigorous exertions, than men who have led indolent, delicate, and luxurious lives, and who have seldom been exposed even to the inclemencies of the weather. The limbs of women, as well as of men, are strengthened and rendered more robust by frequent and laborious exercise. A nation of women, therefore, brought up and disciplined as the ancient Amazons are represented to have been, would be superior to an equal number of effeminate men; though they might be much inferior to an equal number of hardy men trained up and disciplined in the same manner.

That much of what is said of the Amazons is fabulous, there can be no reasonable doubt; but it does not therefore follow, that the whole is without foundation. The ancient medals and monuments on which they are represented are very numerous, as are also the testimonies of ancient writers. It seems not rational to suppose that all this originated in fiction, though it may be much blended with it. The Abbé Guyon speaks of the history of the Amazons as having been regarded by many persons as fabulous, "rather from prejudice than from any real and solid examination;" and it must be acknowledged, that the arguments in favour of their existence, from ancient history, and from ancient monuments, are extremely powerful. The fact seems to be, that truth and fiction have been blended in the narrations concerning these ancient heroines.

Instances of heroism in women have occasionally occurred in modern times, somewhat resembling that of the ancient Amazons. The times and the manners of chivalry in particular, by bringing great enterprises,

Amazons. bold adventures, and extravagant heroism, into fashion, inspired the women with the same taste. The women, in consequence of the prevailing passion, were now seen in the middle of camps and of armies. They quitted the soft and tender inclinations, and the delicate offices of their own sex, for the toils and the toilsome occupation of ours. During the crusades, animated by the double enthusiasm of religion and of valour, they often performed the most romantic exploits; obtained indulgences on the field of battle, and died with arms in their hands, by the side of their lovers or of their husbands.

In Europe, the women attacked and defended fortifications; princesses commanded their armies, and obtained victories. Such was the celebrated Joan de Montfort, disputing for her duchy of Bretagne, and fighting herself. Such was that still more celebrated Margaret of Anjou, active and intrepid general and foldier, whose genius supported a long time a feeble husband; which taught him to conquer; which replaced him upon the throne; which twice relieved him from prison; and, oppressed by fortune and by rebels, which did not bend till after she had decided in person twelve battles.

The warlike spirit among the women, consistent with ages of barbarism, when every thing is impetuous because nothing is fixed, and when all excess is the excess of force, continued in Europe upwards of 400 years, showing itself from time to time, and always in the middle of convulsions or on the eve of great revolutions. But there were æras and countries in which that spirit appeared with particular lustre. Such were the displays it made in the 15th and 16th centuries in Hungary, and in the islands of the Archipelago and the Mediterranean when they were invaded by the Turks.

Among the striking instances of Amazonian conduct in modern ladies, may be mentioned that of Jane of Belleville, widow of Monf. de Clifson, who was beheaded at Paris in the year 1343, on a suspicion of carrying on a correspondence with England and the Count de Montfort. This lady, filled with grief for the death of her late husband, and exasperated at the ill treatment which she considered him as having received, sent off "her son secretly to London; and when her apprehensions were removed with respect to him, she sold her jewels, fitted out three ships, and put to sea, to revenge the death of her husband upon all the French with whom she should meet. This new corsair made several descents upon Normandy, where she stormed castles; and the inhabitants of that province were spectators more than once, whilst their villages were all in a blaze, of one of the finest women in Europe, with a sword in one hand and a torch in the other, urging the carnage, and eyeing with pleasure all the horrors of war."

We read in Mezeray, under the article of the Croisade, preached by St Bernard in the year 1147, "That many women did not content themselves with taking the cross, but that they also took up arms to defend it, and composed squadrons of females, which rendered credible all that has been said of the prowess of the Amazons."

In the year 1590, the League party obtained some troops from the king of Spain. Upon the news of their being disembarked, Barri de St Aunez, Henry IV.'s governor at Leucate, set out to communicate a

scheme to the Duke de Montmorenci, commander in that province. He was taken in his way by some of the troops of the League, who were also upon their march with the Spaniards towards Leucate. They were persuaded, that by thus having the governor in their hands the gates of that place would be immediately opened to them, or at least would not hold out long. But Constantia de Cecelli, his wife, after having assembled the garrison, put herself so resolutely at their head, pike in hand, that she inspired the weakest with courage; and the besiegers were repulsed wherever they presented themselves. Shame and their great loss having rendered them desperate, they sent a message to this courageous woman, acquainting her, that if she continued to defend herself they would hang her husband. She replied with tears in her eyes, "I have riches in abundance: I have offered them, and I do still offer them, for his ransom; but I would not ignominiously purchase a life which he would reproach me with, and which he would be ashamed to enjoy. I will not dishonour him by treason against my king and country." The besiegers having made a fresh attack without success, put her husband to death, and raised the siege. Henry IV. afterwards sent to this lady the brevet of governess of Leucate, with the reversion for her son.

The famous Maid of Orleans, also, is an example known to every reader.

The Abbé Arnaud, in his Memoirs, speaks of a Countess of St Balmont, who used to take the field with her husband and fight by his side. She sent several Spanish prisoners of her taking to Marshal Feuquiers; and what is not a little extraordinary, this Amazon at home was all affability and sweetness, and gave herself up to reading and acts of piety.

Dr Johnson seems to have given some credit to the accounts which have been transmitted down to us concerning the ancient Amazons; and he has endeavoured to show, that we ought not hastily to reject ancient historical narrations because they contain facts repugnant to modern manners, and exhibit scenes to which nothing now occurring bears a resemblance. "Of what we know not (says he), we can only judge by what we know. Every novelty appears more wonderful as it is more remote from any thing with which experience or testimony have hitherto acquainted us; and if it passes farther, beyond the notions that we have been accustomed to form, it becomes at last incredible. We seldom consider, that human knowledge is very narrow; that national manners are formed by chance; that uncommon conjunctures of causes produce rare effects; or that what is impossible at one time or place may yet happen in another. It is always easier to deny than to enquire. To refuse credit confers for a moment an appearance of superiority which every little mind is tempted to assume, when it may be gained so cheaply as by withdrawing attention from evidence, and declining the fatigue of comparing probabilities. Many relations of travellers have been slighted as fabulous, till more frequent voyages have confirmed their veracity; and it may reasonably be imagined, that many ancient historians are unjustly suspected of falsehood, because our own times afford nothing that resembles what they tell. Few narratives will either to men or women appear more incredible than the histories of the Amazons; of female nations, of whose constitution

Amazons.

Amazons
||
Amba.

stitution it was the essential and fundamental law, to exclude men from all participation either of public affairs or domestic business; where female armies marched under female captains, female farmers gathered the harvest, female partners danced together, and female wits diverted one another. Yet several ages of antiquity have transmitted accounts of the Amazons of Caucasus; and of the Amazons of America, who have given their name to the greatest river in the world, Condamine lately found such memorials as can be expected among erratic and unlettered nations, where events are recorded only by tradition, and new swarms settling in the country from time to time confuse and efface all traces of former times."

No author has taken so much pains upon this subject as Dr Petit. But, in the course of his work, he has given it as his opinion, that there is great difficulty in governing the women even at present, though they are unarmed and unpractised in the art of war. After all his elaborate inquiries and discussions, therefore, this learned writer might probably think, that it is not an evil of the first magnitude that the race of Amazons now ceases to exist.

Rouffeau says, "The empire of the woman is an empire of softness, of address, of complacency. Her commands are caresses, her menaces are tears." But the empire of the Amazons was certainly an empire of a very different kind. Upon the whole, we may conclude with Dr Johnson: "The character of the ancient Amazons was rather terrible than lovely. The hand could not be very delicate that was only employed in drawing the bow and brandishing the battle-axe. Their power was maintained by cruelty, their courage was deformed by ferocity; and their example only shows, that men and women live best together."

AMAZONS (the river of), in America. See AMAZONIA.

AMAZONIAN Habit, in antiquity, denotes a dress formed in imitation of the Amazons. Marcia, the famous concubine of the emperor Commodus, had the appellation of *Amazonian*, because she charmed him most in a habit of this kind. Hence also that prince himself engaged in combat in the amphitheatre in an Amazonian habit; and of all titles the *Amazonius* was one of those he most delighted in.—In honour either of the gallant or his mistress, the month December was also denominated *Amazonius*—Some also apply *Amazonian habit* to the hunting-dress worn by many ladies among us.

AMBA, an Abyssinian or Ethiopic word, signifying a rock. The Abyssinians give names to each of their rocks, as *Amba-Derbo*, the rock of a hen, &c. Some of these rocks are said to have the name of *Aorni*; and are of such a stupendous height, that the Alps and Pyrenees are but low hills in comparison of them. Amongst the mountains, and even frequently in the plains, of this country, arise steep and craggy rocks of various forms, some resembling towers, others pyramids, &c. so perpendicular and smooth on the sides, that they seem to be works of art; inasmuch, that men, cattle, &c. are craned up by the help of ladders and ropes; and yet the tops of these rocks are covered with woods, meadows, fountains, fishponds, &c. which very copiously supply the animals seated thereon with all the conveniences of life. The most remarkable of these rocks is called *Amba-Gesfen*. It is prodigiously steep, in the

form of a castle built of free stone, and almost impregnable. Its summit is about half a Portuguese league in breadth, and the circumference at the bottom about half a day's journey. The ascent at first is easy; but grows afterwards so steep, that the Abyssinian oxen, which will otherwise clamber like goats, must be craned up, and let down with ropes. Here the princes of the blood were formerly confined, in low cottages amongst shrubs and wild cedars, with an allowance barely sufficient to keep them alive. There is, according to Kircher, in this country, a rock so curiously hollowed by nature, that at a distance it resembles a looking-glass; and opposite to this another, on the top of which nothing can be so softly whispered but it may be heard a great way off. Between many of these rocks and mountains are vast abysses, which appear very dreadful to the eye.

AMBACHT, in topography, denotes a kind of jurisdiction or territory, the possessor whereof has the administration of justice both in *alto* and *basso*; or of what is called in the Scots law a *power of pit and gallows*, i. e. a power of drowning and hanging.—In some ancient writers, *ambacht* is particularly used for the jurisdiction, government, or chief magistracy of a city. The word is very ancient, though used originally in a sense somewhat different. Ennius calls a mercenary, or slave hired for money, *ambactus*; and Cæsar gives the same appellation to a kind of dependents among the Gauls, who, without being slaves, were attached to the service of great lords.

AMBAGES. See CIRCUMLOCUTION.

AMBARVALIA, in antiquity, a ceremony among the Romans, when, in order to procure from the gods an happy harvest, they conducted the victims thrice round the corn-fields in procession, before sacrificing them.—*Ambarvalia* were either of a private or public nature; the private were performed by the master of a family; and the public by the priests who officiated at the solemnity, called *fratres ovales*. The prayer preferred on this occasion, the formula of which we have in Cato *de Re Rustica*, cap. cxlii. was called *carmen ambervale*. At these feasts they sacrificed to Ceres a sow, a sheep, and a bull or heifer, whence they took the name of *suovetaurilia*. The method of celebrating them was, to lead a victim round the fields, while the peasants accompanied it, and one of their number, crowned with oak, hymned forth the praises of Ceres, in verses composed on purpose. This festival was celebrated twice a-year; at the end of January, according to some, or in April, according to others; and for the second time, in the month of July.

AMBASSADOR, or EMBASSADOR, a public minister sent from one sovereign prince, as a representative of his person to another.

Ambassadors are either ordinary or extraordinary. Ambassador *in ordinary*, is he who constantly resides in the court of another prince, to maintain a good understanding, and look to the interest of his master. Till about two hundred years ago, ambassadors in ordinary were not heard of: all, till then, were ambassadors *extraordinary*; that is, such as are sent on some particular occasion, and who retire as soon as the affair is dispatched.

By the law of nations, none under the quality of a sovereign prince can send or receive an ambassador. At Athens, ambassadors mounted the pulpit of the public

Ambacht
||
Ambassa-
dor.

Ambe,
Amber.

orators, and there opened their commission, acquainting the people with their errand. At Rome, they were introduced to the senate, and delivered their commissions to the fathers.

Ambassadors should never attend any public solemnities, as marriages, funerals, &c. unless their masters have some interest therein: nor must they go into mourning on any occasions of their own, because they represent the person of their prince. By the civil law, the moveable goods of an ambassador, which are accounted an accession to his person, cannot be seized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgment, nor by the king's or state's leave where he resides, as some conceive; for all actions ought to be far from an ambassador, as well that which toucheth his necessities, as his person: if, therefore, he hath contracted any debt, he is to be called upon kindly; and if he refuses, then letters of request are to go to his master. Nor can any of the ambassador's domestic servants that are registered in the secretaries of state's office be arrested in person or goods; if they are, the process shall be void, and the parties suing out and executing it shall suffer and be liable to such penalties and corporal punishment as the lord chancellor or either of the chief justices shall think fit to inflict. Yet ambassadors cannot be defended when they commit any thing against that state, or the person of the prince, with whom they reside; and if they are guilty of treason, felony, &c. or any other crime against the law of nations, they lose the privilege of an ambassador, and may be subject to punishment as private aliens.

AMBE, in *surgery*, the name of an instrument for reducing dislocated bones. In *anatomy*, a term for the superficial jutting out of a bone.

AMBER (*Succinum*), in natural history, a solid, hard, semipellucid, bituminous substance of a particular nature, of use in medicine and in several of the arts. It has been called *ambra* by the Arabians, and *electrum* by the Greeks.

Amber has been of great repute in the world from the earliest times. Many years before Christ it was in esteem as a medicine; and Plato, Aristotle, Herodotus, Æschylus, and others, have commended its virtues. In the times of the Romans it became in high esteem as a gem; and in the luxurious reign of Nero, immense quantities of it were brought to Rome, and used for ornamenting works of various kinds.

The most remarkable property of this substance is, that, when rubbed, it draws or attracts other bodies to it: and this, it is observed, it does, even to those substances which the ancients thought it had an antipathy to; as oily bodies, drops of water, human sweat, &c. Add, that by the friction it is brought to yield light pretty copiously in the dark; whence it is reckoned among the native phosphori.

The property which amber possesses of attracting light bodies, was very anciently observed. Thales of Miletus, 600 years before Christ, concluded from hence that it was animated. But the first person who expressly mentions this substance, is Theophrastus, about the year 300 before Christ. The attractive property of amber is likewise occasionally taken notice of by Pliny, and other later naturalists, particularly by Gassendus, Kenelm Digby, and Sir Thomas Brown; but it was generally apprehended that this quality was peculiar to

amber and jet, and perhaps agate, till Gilbert published his treatise *De Magnete*, in the year 1600. From *ἄλεκτρον*, the Greek name for amber, is derived the term *Electricity*, which is now very extensively applied not only to the power of attracting light bodies inherent in amber, but to other similar powers, and their various effects, in whatever bodies they reside, or to whatever bodies they may be communicated.

Amber assumes all figures in the ground; that of a pear, an almond, a pea, &c. In amber there have been said to be letters found very well formed; and even Hebrew and Arabic characters.—Within some pieces, leaves, insects, &c. have likewise been found included; which seems to indicate, either that the amber was originally in a fluid state, or that having been exposed to the sun, it was once softened, and rendered susceptible of the leaves, insects, &c. which came in its way. The latter of these suppositions seems the more agreeable to the phenomenon, because those insects, &c. are never found in the centre of the pieces of amber, but always near the surface. It is observed by the inhabitants of those places where amber is produced, that all animals, whether terrestrial, aerial, or aquatic, are extremely fond of it, and that pieces of it are frequently found in their excrements. The bodies of insects, found buried in amber, are viewed with admiration by all the world; but of the most remarkable of these, many are to be suspected as counterfeit, the great price at which beautiful specimens of this kind sell, having tempted ingenious cheats to introduce animal bodies in such artful manners into seemingly whole pieces of amber, that it is not easy to detect the fraud.

Of those insects which have been originally inclosed in amber, some are plainly seen to have struggled hard for their liberty, and even to have left their limbs behind them in the attempt; it being no unusual thing to see, in a mass of amber that contains a stout beetle, the animal wanting one, or perhaps two of its legs; and those legs left in different places, nearer that part of the mass from which it has travelled. This also may account for the common accident of finding legs, or wings of flies, without the rest of their bodies, in pieces of amber; the insects having, when entangled in the yet soft and viscid matter, escaped, at the expense of leaving those limbs behind them. Drops of clear water are sometimes also preserved in amber. These have doubtless been received into it while soft, and preserved by its hardening round them. Beautiful leaves of a pinnated structure, resembling some of the ferns, or maidenhairs, have been found in some pieces; but these are rare, and the specimens of great value. Mineral substances are also found at times lodged in masses of amber. Some of the pompous collections of the German princes boast of specimens of native gold and silver in masses of amber; but as there are many substances of the marcasite, and other kinds, that have all the glittering appearance of gold and silver, it is not to be too hastily concluded that these metals are really lodged in these beds of amber. Iron is found in various shapes immersed in amber; and as it is often seen eroded, and sometimes in the state of vitriol, it is not impossible but that copper, and the other metals, may be also sometimes immersed in it in the same state: hence the bluish and greenish colours, frequently found in the recent pieces of amber, may be owing, like the particles

Amber.

Amber. particles of the gem colours, to those metals; but as the gems, by their dense texture, always retain their colours, this lighter and more lax bitumen usually loses what it gets of this kind, by keeping some time. Small pebbles, grains of sand, and fragments of other stones, are not unfrequently also found immersed in amber.

Naturalists have been greatly divided as to the origin of this substance, and what class of bodies it belongs to; some referring it to the vegetable, others to the mineral, and some even to the animal kingdom. Pliny describes it as "a resinous juice, oozing from aged pines and firs (others say from poplars, whereof there are whole forests on the coasts of Sweden), and discharged thence into the sea, where, undergoing some alteration, it is thrown, in this form, upon the shores of Prussia, which lie very low: he adds, that it was hence the ancients gave it the denomination *succinum*; from *succus*, juice."

Some suppose amber a compound substance. Prussia, say they, and the other countries which produce amber, are moistened with a bituminous juice, which mixing with the vitriolic salts abounding in those places, the points of those salts fix its fluidity, whence it congeals; and the result of that congelation makes what we call amber; which is more or less pure, transparent, and firm, as those parts of salt and bitumen are more or less pure, and are mixed in this or that proportion.

Mr Brydone, in his tour to Sicily and Malta, says, that the river Gearetta, formerly celebrated by the poets under the name of Simetus, throws up near its mouth great quantities of amber. He mentions also a kind of artificial amber, not uncommon there, made, as he was told, from copal, but very different from the natural.

According to Hartman, amber is formed of a bitumen, mixed with vitriol and other salts. But though this were allowed him in regard to the fossile amber, many dispute whether the sea-amber be so produced. It is, however, apparent, that all amber is of the same origin, and probably that which is found in the sea has been washed thither out of the cliffs; though Hartman thinks it very possible, that some of it may be formed in the earth under the sea, and be washed up thence. The sea-amber is usually finer to the eye than the fossile; but the reason is, that it is divested of that coarse coat with which the other is covered while in the earth.

Upon the whole, it seems generally agreed upon, that amber is a true bitumen of fossile origin.—In a late volume of the *Journal de Physique*, however, we find it asserted by Dr Girtanner to be an animal product, a sort of honey or wax formed by a species of large ant called by Linnæus *formica rufa*. These ants, our author informs us, inhabit the old pine forests, where they sometimes form hills about six feet in diameter; and it is generally in these ancient forests, or in places where they have been, that fossile amber is found. This substance is not hard as that which is taken up in the sea at Prussia, and which is well known to naturalists. It has the consistence of honey or of half melted wax, but it is of a yellow colour like common amber; it gives the same product by chemical analysis, and it hardens like the other when it is suffered to remain some time in a solution of common

Amber. salt. This accounts for the insects that are so often found inclosed in it. Among these insects ants are always the most prevailing; which tends farther, Mr Girtanner thinks, to the confirmation of his hypothesis. Amber then, in his opinion, is nothing but a vegetable oil rendered concrete by the acid of ants, just as wax is nothing but an oil hardened by the acid of bees; a fact incontestably proved, we are told, since Mr Metherie has been able to make artificial wax by mixing oil of olives with the nitrous acid, and which wax is not to be distinguished from the natural.

There are several indications which discover where amber is to be found. The surface of the earth is there covered with a soft scaly stone; and vitriol in particular always abounds there, which is sometimes found white, sometimes reduced into a matter, like melted glass, and sometimes figured like petrified wood.

Amber of the finest kind has been found in England. It is frequently thrown on the shores of Yorkshire, and many other places, and found even in our clay-pits; the pits dug for tile-clay, between Tyburn and Kensington gravel-pits, and that behind St George's Hospital at Hyde-park corner, have afforded fine specimens.

Poland, Silesia, and Bohemia, are famous for the amber dug up there at this time. Germany affords great quantities of amber, as well dug up from the bowels of the earth, as tossed about on the shores of the sea and rivers there. Saxony, Misnia, and Sweden, and many other places in this tract of Europe, abound with it. Denmark has afforded, at different times, several quantities of fossile amber; and the shores of the Baltic abound with it. But the countries lying on the Baltic afford it in the greatest abundance of all; and of these the most plentiful country is Prussia, and the next is Pomerania. Prussia was, as early as the times of Theodorick the Goth, famous for amber; for this substance coming into great repute with this prince, some natives of Prussia, who were about his court, offered their service to go to their own country, where that substance, they said, was produced, and bring back great stores of it. They accordingly did so; and from this time Prussia had the honour to be called the Country of Amber, instead of Italy, which had before undeservedly that title. This article alone brings his Prussian Majesty a revenue of 26,000 dollars annually. The amber of Prussia is not only found on the sea-coasts, but in digging; and though that of Pomerania is generally brought from the shores, yet people who dig, on different occasions, in the very heart of the country, at times find amber.

Junker describes, after Neumann, the Prussian amber-mines, which are the richest known.—First, at the surface of the earth, is found a stratum of sand. Immediately under this sand is a bed of clay, filled with small flints of about an inch diameter each. Under this clay lies a stratum of black earth, or turf, filled with fossile wood, half decomposed, and bituminous; this stratum is extended upon a bank of minerals, containing little metal, except iron, which are consequently pyrites. Lastly, under this bed the amber is found, scattered about in pieces, or sometimes accumulated in heaps.

Amber has a subacid resinous taste, and fragrant aromatic smell, especially when dissolved. It differs from the other bituminous substances in this, that it yields by distillation a volatile acid salt, which none of the others do; otherwise it affords the same sort of principles

Amber
||
Amber-
græcæ.

principles as them, viz. an acid phlegm, an oil which gradually becomes thicker as the distillation is continued; and when the operation is finished, there remains a black caput mortuum in the retort.—When boiled in water, it neither softens, nor undergoes any sensible alteration. Exposed to the fire in an open vessel, it melts into a black mass very like a bitumen: It is partly soluble in spirit of wine, and likewise in some essential oils; but it is with difficulty that the expressed ones are brought to act upon it; the stronger sorts of fixed alkaline lixivium almost totally dissolve it.

This substance is principally of two colours, white and yellow. The white is the most esteemed for medicinal purposes, as being the most odoriferous, and containing the greatest quantity of volatile salt; tho' the yellow is most valued by those who manufacture beads and other toys with it, by reason of its transparency.

Amber is the basis of all varnishes, by solution in the ways described under the article VARNISH.

Amber, when it has once been melted, irrecoverably loses its beauty and hardness. There have been some, however, who pretended they had an art of melting some small pieces of amber into a mass, and constituting large ones of them: but this seems such another undertaking as the making of gold; all the trials that have yet been made by the most curious experimenters, proving, that the heat which is necessary to melt amber, is sufficient to destroy it. Phil. Transf. N^o 248. p. 25.

Could amber indeed be dissolved without impairing its transparency, or one large mass be made of it by uniting several small ones, it is easy to see what would be the advantages of such a process. The art of embalming might possibly be also carried to a great height by this, if we could preserve the human corpse in a transparent case of amber, as the bodies of flies, spiders, grasshoppers, &c. are to a great perfection. Something of a substitute of this kind we have in fine rosin; which being dissolved by heat, and the bodies of small animals several times dipped in it, they are thus coated with colophony, that in some degree resembles amber; but this must be kept from dust.

Amber in substance has been much recommended as a nervous and cordial medicine; and alleged to be very efficacious in promoting the menstrual discharge, and the exclusion of the fœtus and secundines in labour: but as in its crude state it is quite insoluble by our juices, it certainly can have very little effect on the animal system, and therefore it is now seldom given in substance. The forms in which amber is prepared are, A tincture, a salt, and an oil; the preparation and uses of which are described in the proper place under the article PHARMACY.

AMBER-Tree, the English name of a species of ANTHOSPERMUM.

AMBERG, a city of Germany, the capital of the palatinate of Bavaria, with a good castle, ramparts, bastions, and deep ditches. It is seated near the confines of Franconia, on the river Wils. It drives a great trade in iron and other metals, found in the neighbouring mountains. E. Long. 12. 4. N. Lat. 20. 46.

AMBERGREASE, AMBERGRISE, or GREY AMBER, in natural history, is a solid, opaque, ash-coloured,

fatty, inflammable substance, variegated like marble, remarkably light, rugged and uneven in its surface, and has a fragrant odour when heated. It does not effervesce with acids; it melts freely over the fire, into a kind of yellow rosin; and is hardly soluble in spirit of wine.

It is found swimming upon the sea, or the sea-coast, or in the sand near the sea-coast; especially in the Atlantic ocean, on the sea-coast of Brasil, and that of Madagascar; on the coast of Africa, of the East Indies, China, Japan, and the Molucca islands; but most of the ambergrise which is brought to England comes from the Bahama islands, from Providence, &c. where it is found on the coast. It is also sometimes found in the abdomen of whales by the whale-fishermen, always in lumps of various shapes and sizes, weighing from half an ounce to an hundred and more pounds. The piece which the Dutch East India Company bought from the king of Tydor, weighed 182 pounds. An American fisherman from Antigua found some years ago, about 52 leagues south-east from the Windward Islands, a piece of ambergrise in a whale, which weighed about 130 pounds, and sold for 500 l. Sterling.

There have been many different opinions concerning the origin of this substance.

It has been supposed to be a fossil bitumen or naphtha, exuding out of the bowels of the earth in a fluid form, and distilling into the sea, where it hardens and floats on the surface. But having been frequently found in the belly of whales, it has by others been considered as entirely an animal production.

Clusius asserted it to be a phlegmatic recrement, or indurated indigestible part of the food, collected and found in the stomach of the whale, in the same manner as the BEZOARS are found in the stomach of other animals.

In an account communicated by Paul Dudley, Esq; in the 23d volume of the Philosophical Transactions, the ambergrise found in whales is represented as a kind of animal product, like musk, and castoreum, &c. secreted and collected in a peculiar bag or bladder, which is furnished with an excretory duct or canal, the spout of which runs tapering into and through the length of the penis; and that this bag, which lies just over the testicles, is almost full of a deep orange-coloured liquor, not quite so thick as oil, of the same smell as the balls of ambergrise, which float and swim loose in it: which colour and liquor may also be found in the canal of the penis; and that therefore ambergrise is never to be found in any female, but in the male only. But these circumstances are not only destitute of truth, but also contrary to the laws of the animal œconomy: For, in the first place, ambergrise is frequently found in females as well as males; although that found in females is never in such large pieces, nor of so good a quality, as what is found in males. Secondly, No person who has the least knowledge in anatomy or physiology, will ever believe that organised bodies, such as the beaks of the Sepia, which are so constantly found in ambergrise taken out of the whale, can have been absorbed from the intestines by the lacteals or lymphatics, and collected with the ambergrise in the precluded bag above-mentioned.

Kæmpfer, who has given us so many other faithful accounts in natural history, seems to come nearer the truth

Amber-
græcæ.

Amber-
greafe.

truth with regard to the origin of ambergrife, when he fays, that it is the dung of the whale; and that the Japanefe, for this reason, call it *kufura no fuu*, i. e. whale's dung. This account, however, though founded on obfervation, has never obtained credit, but has been confidered rather as a fabulous ftory, with which the Japanefe impofed upon him, who had himfelf no direct obfervation to prove the fact.

This matter, therefore, remained a fubject of great doubt; and it was generally thought to be more probable, that ambergrife, after having been fwallowed, and fomerhow or other changed in the ftomach and bowels of the whale, was found among its excrements.

But the moft fatisfactory account of the real origin of ambergrife, is that given by Dr Swediar in the 73d volume of the Philofophical Tranfactions, art. 15.

We are told by all writers on ambergrife, that fometimes claws and beaks of birds, feathers of birds, parts of vegetables, fhells, fifh, and bones of fifh, are found in the middle of it, or variously mixed with it. Of a very large quantity of pieces, however, which the Doctor examined, he found none that contained any fuch thing; though he allows, that fuch fubftances may fometimes be found in it: but in all the pieces of any confiderable fize, whether found on the fea or in the whale, he constantly found a confiderable quantity of black fpoats, which, after the moft careful examination, appeared to be the beaks of the *SEPIA Octopodia*; and thefe beaks, he thinks, might be the fubftances which have hitherto been always miftaken for claws or beaks of birds, or for fhells.

The prefence of thefe beaks in ambergrife proves evidently, that all ambergrife containing them is in its origin, or muft have been once, of a very foft or liquid nature, as otherwife thefe beaks could not fo constantly be intermixed with it throughout its whole fubftance.

That ambergrife is found either upon the fea and fea-coaft, or in the bowels of whales, is a matter of fact univerfally credited. But it has never been examined into and determined, whether the ambergrife found upon the fea and fea-coaft is the fame as that found in the whale, or whether they are different from one another? Whether that found on the fea or fea-coaft has fome properties, or constituent parts, which that found in the whale has not? And laftly, Whether that found in the whale is fuperior or inferior in its qualities and value to the former?

It is likewife a matter of confequence to know, Whether ambergrife is found in all kinds of whales, or only in a particular fpecies of them? Whether it is constantly and always to be met with in thofe animals? And, if fo, in what part of their body it is to be found?

All thefe queftions we find very fatisfactorily difcuffed by Dr Swediar.

According to the beft information that he could obtain from feveral of the moft intelligent perfons employed in the fpermaceti whale-fifhery, and in procuring and felling ambergrife, it appears, that this fubftance is fometimes found in the belly of the whale, but in that particular fpecies only which is called the *fpermaceti whale*, and which from its defcription and delineation appears to be the *PHYSETER Macrocephalus* Linnæi.

The New England fifhermen, according to their account, have long known that ambergrife is to be found

in the fpermaceti whale; and they are fo convinced of this fact, that whenever they hear of a place where ambergrife is found, they always conclude that the fea in that part are frequented by this fpecies of whale.

The perfons who are employed in the fpermaceti whale-fifhery, confine their views to the *Physeter macrocephalus*. They look for ambergrife in all the fpermaceti whales they catch, but it feldom happens that they find any. Whenever they hook a fpermaceti whale, they obferve, that it constantly not only vomits up whatever it has in its ftomach, but alfo generally difcharges its fæces at the fame time; and if this latter circumftance takes place, they are generally difappointed in finding ambergrife in its belly. But whenever they difcover a fpermaceti whale, male or female, which feems torpid and fickly, they are always pretty fure to find ambergrife, as the whale in this ftate feldom voids its fæces upon being hooked. They likewife generally meet with it in the dead fpermaceti whales, which they fometimes find floating on the fea. It is obferved alfo, that the whale, in which they find ambergrife, often has a morbid protuberance; or, as they exprefs it, a kind of gathering in the lower part of its belly, in which, if cut open, ambergrife is found. It is obferved, that all thofe whales, in whofe bowels ambergrife is found, feem not only torpid and fick, but are alfo constantly leaner than others; fo that, if we may judge from the constant union of thefe two circumftances, it would feem that a larger collection of ambergrife in the belly of the whale is a fource of difeafe, and probably fometimes the caufe of its death. As foon as they hook a whale of this defcription, torpid, fickly, emaciated, or one that does not dung on being hooked, they immediately either cut up the above-mentioned protuberance, if there be any, or they rip open its bowels from the orifice of the anus, and find the ambergrife, fometimes in one fometimes in different lumps, of generally from three to twelve and more inches in diameter, and from one pound to twenty or thirty pounds in weight, at the diftance of two, but moft frequently of about fix or feven feet from the anus, and never higher up in the intefinal canal; which, according to their defcription, is, in all probability, the intefinum cæcum, hitherto miftaken for a peculiar bag made by nature for the fecretion and collection of this fingular fubftance. That the part they cut open to come at the ambergrife is no other than the intefinal canal is certain, becaufe they constantly begin their incifion at the anus, and find the cavity everywhere filled with the fæces of the whale, which from their colour and fmell it is impoffible for them to miftake. The ambergrife found in the intefinal canal is not fo hard as that which is found on the fea or fea-coaft, but foon grows hard in the air: when firft taken out it has nearly the fame colour, and the fame difagreeable fmell, though not fo ftrong, as the more liquid dung of the whale has; but, on expofing it to the air, it by degrees not only grows greyifh, and its furface is covered with a greyifh duft like old chocolate, but it alfo lofes its difagreeable fmell, and, when kept for a certain length of time, acquires the peculiar odour which is fo agreeable to moft people.

The gentlemen the Doctor converfed with confefsed, that if they knew not from experience that ambergrife thus found will in time acquire the above-mentioned

Amber-
greafe.

Amber-
grease.

qualities, they would by no means be able to distinguish ambergrise from hard indurated fæces. This is so true, that whenever a whale voids its fæces upon being hooked, they look carefully to see if they cannot discover among the more liquid excrements (of which the whale discharges several barrels) some pieces floating on the sea, of a more compact substance than the rest; these they take up and wash, knowing them to be ambergrise.

In considering whether there be any material difference between ambergrise found upon the sea or sea-coast, and that found in the bowels or among the dung of the whale, the Doctor refutes the opinion, that all ambergrise found in whales is of an inferior quality, and therefore much less in price. Ambergrise, he observes, is only valued for its purity, lightness, compactness, colour, and smell. There are pieces of ambergrise found on different coasts, which are of a very inferior quality; whereas there are often found in whales pieces of it of the first value; nay, several pieces found in the same whale, according to the above-mentioned qualities, are more or less valuable. All ambergrise found in whales has at first when taken out of the intestines very near the same smell as the liquid excrements of that animal have; it has then also nearly the same blackish colour: they find it in the whale sometimes quite hard, sometimes rather softish, but never so liquid as the natural fæces of that animal. And it is a matter of fact, that, after being taken out and kept in the air, all ambergrise grows not only harder and whiter, but also loses by degrees its smell, and assumes such an agreeable one, as that in general has which is found swimming upon the sea; therefore the goodness of ambergrise seems rather to depend on its age. By being accumulated after a certain length of time in the intestinal canal, it seems even then to become of a whiter colour, and less ponderous, and acquire its agreeable smell. The only reason why ambergrise found floating on the sea generally possesses the above-mentioned qualities in a superior degree, is because it is commonly older, and has been longer exposed to the air. It is more frequently found in males than females; the pieces found in females are in general smaller, and those found in males seem constantly to be larger and of a better quality; and therefore the high price in proportion to the size is not merely imaginary for the rarity-sake, but in some respect well founded, because such large pieces appear to be of a greater age, and possess the above-mentioned qualities in general in a higher degree of perfection than smaller pieces.

It is known, that the *Sepia octopodia*, or cuttle-fish, is the constant and natural food of the spermaceti whale, or *Phyfeter macrocephalus*. Of this the fishers are so well persuaded, that whenever they discover any recent relics of it swimming on the sea, they conclude that a whale of this kind is, or has been, in that part. Another circumstance which corroborates the fact is, that the spermaceti whale on being hooked generally vomits up some remains of the *Sepia*. Hence it is easy to account for the many beaks, or pieces of beaks, of the *Sepia* found in all ambergrise. The beak of the *Sepia* is a black horny substance, and therefore passes undigested through the stomach into the intestinal canal, where it is mixed with the fæces; after which it is either evacuated with them, or if these latter be preter-

N^o 14.Amber-
grease.

naturally retained, forms concretions with them, which render the animal sick and torpid, and produce an obstipation, which ends either in an abscess of the abdomen, as has been frequently observed, or becomes fatal to the animal; whence in both the cases, on the bursting of its belly, that hardened substance, known under the name of *ambergrise*, is found swimming on the sea, or thrown upon the coast.

From the preceding account, and his having constantly found the above-mentioned beaks of the *Sepia* in all pieces of ambergrise of any considerable size, Dr Swediaur concludes with great probability, that all ambergrise is generated in the bowels of the *Phyfeter macrocephalus*, or spermaceti whale; and there mixed with the beaks of the *Sepia octopodia*, which is the principal food of that whale. He therefore defines ambergrise to be the preternaturally hardened dung or fæces of the *Phyfeter macrocephalus*, mixed with some indigestible relics of its food.

The use of ambergrise in Europe is now nearly confined to perfumery, though it has formerly been recommended in medicine by several eminent physicians. Hence the *Essentia Ambraë Hoffmanni*, *Tinctura Regia Cod. Parisini*, *Trochisci de Ambra Ph. Wurtemberg, &c.*

If we wish to see any medicinal effects from this substance, the Doctor observes, we must certainly not expect them from two or three grains, but give rather as many scruples of it for a dose: though even then, he thinks, there would not be reason to expect much effect from it, as he had himself taken of pure unadulterated ambergrise in powder 30 grains at once, without observing the least sensible effect from it. A sailor, however, who had the curiosity to try the effect of recent ambergrise upon himself, took half an ounce of it melted upon the fire, and found it a good purgative; which proves that it is not quite an inert substance.

In Asia and part of Africa ambergrise is not only used as a medicine and as a perfume; but considerable use is also made of it in cookery, by adding it to several dishes as a spice. A great quantity of it is also constantly bought by the pilgrims who travel to Mecca; probably to offer it there, and make use of it in fumigations, in the same manner as frankincense is used in Catholic countries. The Turks make use of it as an aphrodisiac. Our perfumers add it to scented pillars, candles, balls or bottles, gloves, and hair-powder; and its essence is mixed with pomatums for the face and hands, either alone or mixed with musk, &c. tho' its smell is to some persons extremely offensive.

Ambergrise may be known to be genuine by its fragrant scent when a hot needle or pin is thrust into it, and its melting like fat of an uniform consistence; whereas the counterfeit will not yield such a smell, nor prove of such a fat texture.—One thing, however, is very remarkable, that this drug, which is the most sweet of all the perfumes, should be capable of being resembled in smell by a preparation of one of the most odious of all stinks. Mr Homberg found, that a vessel in which he had made a long digestion of the human fæces, acquired a very strong and perfect smell of ambergrise, inasmuch that any one would have thought a great quantity of essence of ambergrise had been made in it. The perfume was so strong and offensive, that the vessel was forced to be removed out of the laboratory.

AMBERT

Ambert
Ambigena AMBERT, a small town of France, in Lower Auvergne, the chief place of a small territory called *Livradois*. It is remarkable for its paper manufactory and camblets. E. Long. 3. 35. N. Lat. 45. 28.

AMBETTUWAY, in botany, a barbarous name of a tree, the leaves of which, when boiled in wine, are said to create an appetite, and is used by the people in Guinea with that intention.

AMBIANI, or AMBIANENSIS CIVITAS, now *Amiens*, a city of Picardy. It is called *Samarobriva* by Cæsar and Cicero; which, according to Valefius, signifies the bridge of the *Samara* or *Somme*. *Ambiani* is a later name, taken from that of the people, after the usual manner of the lower age.

AMBIDEXTER, a person who can use both hands with the same facility, and for the same purposes, that the generality of people do their right hands.—As to the natural cause of this faculty, some, as Hæfer, attribute it to an extraordinary supply of blood and spirits from the heart and brain, which furnish both hands with the necessary strength and agility: others, as Nicholas Massa, to an erect situation of the heart, inclining neither to the right hand nor left; and others to the right and left subclavian arteries being of the same height and the same distance from the heart, by which the blood is propelled with equal force to both hands.—But these are only conjectures, or rather chimeras. Many think, that, were it not for education and habit, all mankind would be ambidexters; and in fact, we frequently find nurses obliged to be at a good deal of pains before they can bring children to forego the use of their left hands. How far it may be an advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are infinite occasions in life, when it would be better to have the equal use of both hands. Surgeons and oculists are of necessity obliged to be ambidexters; bleeding, &c. in the left-arm or left-ankle, and operations on the left-eye, cannot be well performed but with the left-hand.—Various instances occur in history, where the left-hand has been exercised preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exercise both hands alike; and Plato enjoins ambidexterity to be observed and encouraged in his republic.

AMBIDEXTER, among English lawyers, a juror or embracer, who accepts money of both parties, for giving his verdict; an offence for which he is liable to be imprisoned, for ever excluded from a jury, and to pay ten times the sum he accepted of.

AMBIENT, a term used for such bodies, especially fluids, as encompass others on all sides: thus, the air is frequently called an ambient fluid, because it is diffused round the earth.

AMBIGENÆ OVES, in the heathen sacrifices, an appellation given to such ewes as, having brought forth twins, were sacrificed together with their two lambs, one on each side. We find them mentioned among other sacrifices to Juno.

AMBIGENAL HYPERBOLA, a name given by Sir Isaac Newton to one of the triple hyperbolas of the second order, having one of its infinite legs falling within an angle formed by the asymptotes, and the other without.

VOL. I. Part II.

AMBIGUITY, a defect of language, whereby words are rendered ambiguous. See the next article.

AMBIGUOUS, a term applied to a word or expression which may be taken in different senses.—An anonymous writer has published a dictionary of ambiguous words: *Lexicon Philosophicum de Ambiguitate Vocabulorum*, Francof. 1597. 4to.—The responses of the ancient oracles were always ambiguous.

AMBIT, in geometry, is the same with what is otherwise called the perimeter of a figure. See PERIMETER.

AMBIT was particularly used, in antiquity, to denote a space of ground to be left vacant betwixt one building and another. By the laws of the twelve tables, houses were not to be built contiguous, but an ambit or space of $2\frac{1}{2}$ feet was to be left about each for fear of fire.—The ambitus of a tomb or monument denoted a certain number of feet, in length and breadth, around the same, within which the sanctity assigned to it was limited. The whole ground wherein a tomb was erected was not to be secreted from the common uses; for this reason, it was frequent to inscribe the ambit on it, that it might be known how far its sanctity extended: thus, *in fronte pedes tot, in agrum pedes tot*.

AMBITION (*ambitio*), is generally used in a bad sense, for an immoderate or illegal pursuit of power.

In the strict meaning, however, of the word, it signifies the same with the *ambitus* of the Romans. See the next article.

Ambition, in the former and more usual sense, is one of those passions that is never to be satisfied. It swells gradually with success, and every acquisition serves but as a spur to further attempts.

“If a man (it has been well observed), could at once accomplish all his desires, he would be a miserable creature; for the chief pleasure of this life is to wish and desire. Upon this account, every prince who aspires to be despotic aspires to die of weariness. Searching every kingdom for the man who has the least comfort in life, Where is he to be found?—In the royal palace.—What! his majesty? Yes; especially if he be despotic.”

AMBITUS, in Roman antiquity, the setting up for some magistracy or office, and formally going round the city to solicit the interest and votes of the people.

Ambitus differed from *ambition*, as the former lies in the act, the latter in the mind.

Ambitus was of two kinds; one lawful, the other infamous. The first, called also *ambitus popularis*, was when a person offered his service to the republic frankly, leaving it to every body to judge of his pretensions as they found reasonable. The means and instruments here made use of were various. 1. *Amici*, or friends, under different relations, including *cognati*, *affines*, *necessarii*, *familiares*, *vicini*, *tribules*, *clientes*, *municipes*, *sodales*, *collegæ*. 2. *Nomenclatura*, or the calling and saluting every person by his name; to which purpose, the candidates were attended with an officer, under the denomination of *interpres*, or *nomenclator*: 3. *Blanditia*; or obliging persons, by serving them, or their friends, patrons, or the like, with their vote and interest on other occasions. 4. *Prenatio*; the shaking every person by the hand, offering him his service, friendship,

Amble
||
Amb-hist-
mene.

friendship, &c.—The second kind was that wherein force, cajoling, money, or other extraordinary influence, was made use of. This was held infamous, and severely punished, as a source of corruption and other mischiefs.

Ambitus was practised not only at Rome and in the forum, but in the meetings and assemblies of other towns in Italy, where numbers of citizens were usually found, on account of trade and business.—The practice ceased in the city from the time of the emperors, by reason posts were not then to be had by courting the people, but by favour from the prince.

Persons who had causes depending practised the same, going about among the judges to implore their favour and mercy. They who practised this were called *Ambitiosi*. Hence we also meet with *ambitiosa decreta*, and *ambitiosa iussa*, used for such sentences and decrees as were thus procured from the judges, contrary to reason and equity, either gratuitously or for money.

AMBLE, in horsemanship, a peculiar pace by which a horse's two legs of the same side move at the same time. See HORSEMANSHIP.

AMBLESIDE, a town in Westmorland, seated at one end of Winandermeer, W. long. 0. 49. N. lat. 54. 30.

AMBLETEUSE, a sea-port town of France, in Picardy, defended with a battery of cannon. E. long. 1. 30. N. lat. 49. 40.

AMBLYGON, in geometry, denotes an obtuse-angled triangle, or a triangle one of whose angles consists of more than 90 degrees.

AMBLYOPY, among physicians, signifies an obscuration of the sight, so that objects at a distance cannot be clearly distinguished.

AMBO, or AMBON, a kind of pulpit or desk, in the ancient churches, where the priests and deacons stood to read or sing part of the service, and preach to the people; called also *Analogium*. The term is derived from ἀμβωνον, "to mount."—The ambo was mounted upon two sides; whence some also derive the appellation from the Latin *ambo*, "both."

The ambo was ascended by steps; which occasioned that part of the office performed there to be called the *Gradual*. See GRADUAL.

Besides the gospel, which was read at the top of the ambo, and the epistle, which was read a step lower, they likewise published from this place the acts of the martyrs, the commemoration of departed saints, and the letters of peace and communion sent by one church to another: here, too, converts made a public profession of their faith; and bishops, their defence, when accused: treaties also were sometimes concluded, and the coronations of emperors and kings performed, in the same place.

The modern reading-desks and pulpits have been generally substituted to the ancient Ambos; though, in some churches, remains of the ambos are still seen. In that of St John de Lateran at Rome, there are two moveable ambos.

AMBOHITSMENE, or VOHITSANGHOMBE, a province of the island of Madagascar, so called from some red mountains of the same name, lying in S. Lat. 20°. These mountains are very high, resembling the

Tafelberg of the Cape of Good Hope. On one side of this ridge the sea extends into the country for fifteen leagues; on the other is a flat country abounding in ponds and marshes. Here is also a lake fifteen leagues in length, and the same in breadth, containing many small islands. The inhabitants of the mountains are called *Zaferabongs*; and have plenty of gold, iron, cattle, silk, &c.

AMBOISE, a town of France, in Touraine, seated at the confluence of the rivers Loire and Maffee. The town is mean and ill built; but has been rendered famous in history by the conspiracy of the Protestants in 1560, which opened the fatal wars of religion in France. The castle is situated on a craggy rock, extremely difficult of access, and the sides of which are almost perpendicular. At its foot flows the Loire, which is divided into two streams by a small island. To this fortress the duke of Guise, when he expected an insurrection among the Hugonots, removed Francis II. as to a place of perfect security. Only two detached parts of the ancient castle now remain, one of which was constructed by Charles VIII. and the other by Francis I. The former of those princes was born, and died at Amboise. The town is situated E. Long. 1. 30. N. Lat. 47. 25.

AMBOULE, a province of Madagascar, somewhat to the northward of S. Lat. 23°. It is a fertile and agreeable country, watered by the river Manampani, whose mouth lies in S. Lat. 23. 30. The country produces plants and fruits in plenty. Iron mines are also found here. The black cattle are extremely fat, and their flesh excellent. In this province stands a large town of the same name; near which is a fountain of hot water, within 20 feet of a small river whose sand is almost burning. The water of the fountain is said to boil an egg hard in two hours; and the inhabitants affirm it to be a sovereign remedy against the gout. The people here are employed in different preparations of iron and steel, which they have from their own mines, and forge several instruments with tolerable skill. Their governor is honoured with the title of *Rabertau*, or *Great Lord*. He exercises sovereign authority and absolute power; but is frequently, in times of distress, surprised by his subjects, who assemble in great numbers, seize his person, and threaten him with death unless they are relieved. To extricate himself from this dilemma, he is instantly obliged to issue orders for distributing provisions among them; but is usually repaid with interest, a quadruple return being made in a plentiful harvest. The people of Amboule live in great licentiousness with their superiors, and their country is generally a retreat for the roguish and lazy.

AMBOYNA, one of the Molucca islands, in the East Indies. It lies in S. Lat. 3. 36. and E. Long. 126. 20. and is remarkable for being the centre of the commerce for nutmegs and cloves, which is entirely monopolized by the Dutch East-India company. It is about 24 leagues in circumference. Besides cloves, it likewise abounds in most of the tropical fruits and fish; nor is there here any deficiency of good water; but flesh is very scarce. This scarcity, however, proceeds more from the policy of the Dutch than either the intemperature of the climate or the barrenness of the soil: For, excepting cloves, they have in Amboyna,

Amboise
||
Amboyna

Amboyna. na, as well as the Moluccas, industriously discouraged the cultivation of every esculent commodity, with the view of with-holding subsistence from those who might be tempted to invade them.

Of the natives, the men wear large whiskers, but leave little hair upon their chin; and have only a slight piece of stuff wrapped round their middle. The women tie their hair in knots: the maids are bought of their fathers before they are married; and if the wife proves barren, the marriage is dissolved. Some of the natives are Mahometans, and some Christians: but they are all said to be lazy, deceitful, and treacherous. They make war with small swift vessels, in shape like dragons with regard to the head and tail. Their houses are built of bamboo-canes and fago-trees. They sleep on mats. Their weapons are bows and arrows, javelins, scymitars, and targets.

Amboyna was first discovered by the Portuguese, who built a fort upon it, which was taken from them by the Dutch in 1605. They did not, however, become masters of the whole island at once. The English had here five factories, which lived under the protection of the Dutch castle; holding themselves safe, in respect of the friendship between the two nations. Great differences had arisen between the Dutch and English colonists in this part of the world; till at last, the English East-India company applying to king James, a treaty was concluded in 1619, by which the concerns both of the English and Dutch were regulated, and certain measures agreed upon for preventing future disputes. This was an additional security to the English; and, by virtue of the treaty, they continued two years in Amboyna, trading with the Dutch. During this time, however, several disputes happened; which occasioning mutual discontents, the complaints were sent to Jaccatra, in the island of Java Major, to the council of defence of both nations there residing: but they not agreeing, a state of the matter was sent over to Europe, to be decided by the East-India companies of both nations; or, in case they could not agree, by the King of England and the States of Holland, according to an article in the treaty of 1619.—But before these disputes could be decided in a legal way, the Dutch, in order to give the more specious colouring to the violent seizure which they meditated of the island of Amboyna, made use of the stale pretext of a conspiracy being formed by the English and Japanese to dispossess them of one of their forts in this place. The plot, it was alleged, had been confessed by a Japanese and Portuguese in the English service, who were most inhumanly tortured till they should answer in the affirmative such interrogatories as might favour the secret design of those cruel inquisitors. Upon the injurious evidence of this constrained declaration, they immediately accused the English factors of the pretended conspiracy. Some of them they imprisoned, and others they loaded with irons and sent on board their ships; seizing at the same time all the English merchandise, with their writings and books.

These acts of violence were followed by a scene of horror unexampled in the punishment of the most atrocious offenders. Some of the factors they tortured, by compelling them to swallow water till their bodies were distended to the utmost pitch; then taking the miserable victims down from the boards to which they

had been fastened, and causing them to disgorge the water; if they did not acknowledge the imputed guilt, the process of torture was repeated. Others of the English they consumed by burning them gradually from the feet upwards, in order to extort the confession of a conspiracy, which was only pretended by the infernal policy of those savage tormentors. Some had the nails of the fingers and toes torn off; and in some they made holes in their breasts, filling the cavities with inflammable materials, to which they afterwards put fire. Those who did not expire under the agonies of torture were consigned to the hands of the executioner.

The allegation of this pretended conspiracy was equally void of probability and truth. The Dutch had a garrison of 300 men in the fort; besides the burghers in the town, and several other forts and garrisons in the island, while the number of the English did not amount to 20 men; nor were even those provided with arms or ammunition to effect such a design as that with which they were charged. There likewise was not one English vessel in the harbour, whereas the Dutch had eight ships riding near the town: neither, when the Dutch broke open the desks and trunks of the factors, was there found a single paper or letter which could be construed into the most distant relation to any conspiracy. Add to all this, that such of the unhappy sufferers as could speak to be heard, declared in the most solemn manner their innocence of the plot with which they were charged.

The whole of the transaction affords the most irrefragable testimony that it was founded entirely upon a political fiction of the Hollanders, who had themselves formed the design of monopolizing the trade of the Spice Islands; for the accomplishment of which they perpetrated, about the same time, a similar tragedy at Pooleron, where they put to the torture 162 of the natives, whom they likewise charged with a pretended conspiracy. It may justly be reckoned singular in the fortune of this commercial republic, that they have ever since been permitted to enjoy in peace those invaluable islands, which were originally obtained by such atrocious infringements of humanity and the laws of nations as will stain the Dutch annals, to the latest ages, with indelible infamy.

The more effectually to preserve this trade, the Dutch have had all the clove-trees in the adjacent islands grubbed up. Sometimes also, when the harvest is very large, part of the produce of Amboyna itself is burnt.—To prevent the rearing of cloves in any of the neighbouring islands, or the inhabitants from selling them to strangers, the governor of Amboyna makes the tour of his government with a fleet of curricurries, consisting sometimes of 20, and at others of 30, 40, or 50 sail. This expedition is made with all the pomp imaginable, in order to gratify the pride and folly of the Indian chiefs. The true reason of their taking all this pains is, because experience has shown, that no contracts, however solemn, can prevent the inhabitants of those islands from selling their spice to strangers; and even now, frauds are so frequently practised by the Dutch themselves, though the company is inexorable in punishing them, that the common people call the cloves *galcken-kruid*, that is, the gallows-spice.

Besides the cloves, coffee is also cultivated here by

Ambracia. the Dutch, and a gold mine has been lately found out. This was discovered by the quantities of gold-dust that were washed from some mountains by the torrents. Here also grow several kinds of valuable wood, of which they make tables, chairs, escrivoirs, &c. for the principal persons in the government; and the rest is sold all over the Indies at a very extravagant rate.

Amboyna is dividéd into two parts, viz. a greater and lesser peninsula. The former, called *Hiton*, is 12 leagues in length, and two and a half broad. In this the Dutch have no less than five forts, or rather strong redoubts, mounted with cannon. The other is called *Leytimor*, five leagues in length, and one and a half broad, which is the southern part of the island; on this stands the fort of *Victoria*, which is the residence of the governor, and his council, composed of 15 gentlemen or merchants. The fortress is a square, the ramparts mounted with 60 pieces of brass cannon, and the garrison usually composed of 600 men. It is so strong by nature and art, as to be in a manner impregnable; and so effectually does it command the harbour, that no vessel could come in or go out without being sunk by the cannon, if the governor chose. The inhabitants of Amboyna are computed at 70 or 80,000, of whom but a small number are Dutch; and this obliges the latter to be continually upon their guard, and to keep a competent number of troops in each of their forts, particularly in that of *Middleburgh*, which stands upon the isthmus that connects these peninsulas. There are also redoubts and garrisons in all the islands of this government.

AMBRACIA, one of the most considerable cities of ancient Epirus, situated on the river *Araëthus*, at a small distance from the sea. At first it was a free city; but was afterwards reduced by the *Æacidæ* kings of Epirus, who chose it for the place of their residence. In process of time, the *Ætolians* made themselves masters of it, and held it till the year before Christ 189, when it fell into the hands of the Romans.

At this time Ambracia was a place of great strength. It was defended on one side by the river *Araëthus*, and on the other by steep and craggy hills; and surrounded with an high and thick wall, above three miles in compass. The Roman consul *Fluvius* began the siege by forming two camps, separated by the river, but with a communication between them; the Romans were posted in one, and the Epirots their allies in the other. He then threw up two lines, one of circumvallation, and the other of contravallation; and built a wooden tower, in form of a castle, over against the citadel, which stood on a hill. The *Ætolians*, however, before the lines were quite finished, found means to throw about 1000 men into the place.

The lines being completed, the city was attacked in five different places at once. The battering-rams shook the walls on all sides; and the Romans, from their moveable towers, pulled down the battlements with a kind of sythes which they fastened to long beams. The besieged made a vigorous defence. They were night and day on the walls, and indefatigable in preventing the effects of the rams and sythes. The strokes of the former they deadened, by letting down beams, large stones, lumps of lead, &c. by means of pulleys, upon them when they were in motion; the others they rendered useless,

by pulling the beams to which they were fastened into the city with hooks contrived for the purpose. *Ambracia.*

While *Fluvius* was carrying on the siege, *Nicaner*, the *Ætolian* prætor found means to throw 500 men into the city, under the command of one *Nicodamus*, with whom *Nicaner* agreed to attack the Roman camp in the night-time; not doubting, that, if the garrison from within, and the army from without, fell upon them at the same time, they would be obliged to raise the siege. *Nicodamus* narrowly watched the time at which he was ordered to sally; and, though *Nicaner* did not appear, marched out at the head of the garrison, armed with fire-brands and torches. The Roman centinels, surprised at this sight, ran to wake the legionaries, and soon spread a general alarm all over the camp. The legionaries marched in small bodies as they happened to meet, to repulse the enemy, whom they engaged in three different places. Two parties of the garrison were driven back: but the third, commanded by two *Ætolian* generals, made a great slaughter of the Romans; and, not finding themselves seconded by *Nicaner*, retired in good order into the city.

Though the besieged were thus abandoned, and had no hopes of assistance, they continued to defend themselves with incredible vigour and resolution. The Romans had no sooner made a breach in the wall, but it was repaired, and a new one built behind it. The consul, therefore, altered his measures; and, instead of making breaches with the ram, began to undermine the wall, in hopes of throwing down great part of it at once, and entering the city before the besieged could have time to build a new wall. The miners being covered, were not observed by the garrison, till the great quantities of earth brought out of the mine gave the alarm. The *Ætolians* immediately began to countermine; and having dug a trench of the depth they supposed the mine to be, they carried it along the wall where they heard the strokes of the pick-axes of the Romans. When the two mines met, a battle ensued, first with pick-axes and spades, and then with swords and spears: but this attack did not last long, each party making themselves a kind of rampart with the loose earth. The *Ætolians*, in order to drive their enemies quite out of the mine, invented a machine, which they brought to the place where the two mines met: this was an hollow vessel with an iron bottom, bored through in many places, and armed with spikes at proper distances to prevent the enemy from approaching it: this vessel they filled with feathers, which they set on fire, and with bellows driving the smoke on the besiegers, obliged them to leave the mine, half-suffocated. This interval the *Ætolians* made use of in repairing the foundations of the wall.

The vigorous resistance made by the Ambracians, however, did not raise the courage of the nation in general, who were determined on a peace with Rome at all events. *Fluvius*, in the mean time, being desirous of getting possession of Ambracia before the conclusion of the peace, employed *Amynder*, king of the *Athamanes*, to persuade the inhabitants to surrender. As *Amynder* had great interest in Ambracia, having long resided there, he easily persuaded them to capitulate on the following terms, viz. That the *Ætolian* garrison should have leave to march out of the city; that the inhabitants

Ambreada inhabitants should pay 500 talents, 200 down, and the rest at six equal payments; and that they should deliver to the consul all the prisoners and deserters that were in the city. The gates were then opened to Fluvius; and he was presented with a crown of gold, together with many fine statues and pictures, of which there were great numbers in the city, it having been the capital of Pyrrhus, who had enriched it with many valuable monuments.

From this time the city of Ambracia made no figure in history. It is scarce known at present where the city stood; but that called *Arba*, in upper Albania, seems best to agree with what is said of the ancient situation of this city. The river Aracthus, on which Ambracia was situated, is now called, by the natives, *Spagindgmarisi*.

AMBREADA, thus they call the false or factitious amber, which the Europeans use in their trade with the negroes on the coast of Africa, and particularly on the river Senegal. There are some large and red pieces of it, a thousand of which making twenty ropes or strings, weigh three pounds. There are others small, and also red, which weigh but two pounds and a half.

AMBRESBERRY, a market-town in Wiltshire, about six miles north of Salisbury, and situated in W. Long. 1. 40. and N. Lat. 51. 20.

AMBRONES, a Gaulish people who lived near the foot of the Alps, between Switzerland and Provence. They invaded the Roman territories in conjunction with the Cimbri and Teutones; but were defeated with great slaughter by Marius, about 101 years before Christ. Their women, who had staid during the engagement in a kind of fortification made with their carts, on seeing their husbands flying, and the Romans at their heels, armed themselves with axes, and, gnashing with their teeth, fell with fury on the pursuers and the pursued. Their first rage being spent, they desired to surrender themselves, upon the single condition, that their chastity should not be violated; but this equitable request being denied, they first killed their children, and then themselves, not one remaining alive out of the whole multitude.

AMBROSE-ISLAND, a small island laid down in some of the most approved charts, and particularly mentioned in Mr Robertson's Elements of Navigation, as lying in S. Lat. 25. 30. W. Long. 82. 20. It was searched for, however, in 1767, by Captain Carteret, with such diligence, that he concludes it to have no existence, as he could not discover land any where near that place.

AMBROSE (St), bishop of Milan, one of the most eminent fathers of the fourth century, born in Gaul in the year 333, according to Dr Cave, or in 340, as Mr Du Pin affirms. His father was at this time *præfectus prætorio* in Gaul; and resided at Arles, the capital of Gallia Narbonensis. The birth of Ambrose is said to have been followed with a remarkable preface of his future eloquence; for we are told, that a swarm of bees came and settled upon his mouth as he lay in his cradle. He soon made himself master of the several parts of secular learning; and pleaded causes before Probus with so much eloquence, that he was appointed his assessor, and soon after governor of the provinces of Liguria and Æmilia. He settled at Milan; where, in the year 374, upon the death of Auxentius bishop of

that city, there being a great contest between the Catholics and Arians concerning the choice of a new bishop, Ambrose thought it his duty, as governor, to go to the church, in order to compose the tumult. He accordingly addressed himself to the people in a gentle pathetic speech, exhorting them to proceed to their choice in a calm and friendly manner: while he was speaking to them, the whole assembly cried out with one voice, "Let Ambrose be bishop!" Such a sudden and unexpected incident surpris'd him extremely; so that he retired immediately, and used every method to divert them from their resolution of choosing him: but at last he was obliged to comply; and was baptis'd (being but a catechumen before), and ordained bishop, towards the latter end of the year 374, or beginning of 375. About the year 377, the barbarous nations making an incursion into the Roman empire, he fled to Illyricum, and afterwards to Rome. In the year 384, he was sent to the tyrant Maximus, who had usurped the empire, and prevail'd upon him not to pass over into Italy. The heathens being encouraged by these intestine commotions in the empire, attempted to restore their religion, and employ'd Q. Aurelius Symmachus, prefect of Rome, a man of great eloquence; to plead their cause. This gave rise to the famous contest between St Ambrose and him, about repairing the altar of Victory. But Symmachus having lost his cause, was expelled the city, and commanded not to approach within an hundred miles of it. The petition which he presented to the emperor Valentinian the younger, is still extant; we find in it the strongest figures of rhetoric and the greatest force of eloquence. St Ambrose wrote a confutation of this petition; but he has been thought guilty of many paralogisms: and yet he protests, "that he endeavour'd only after the solidity of reasoning, leaving Symmachus all the glory of eloquence and politeness; it being (says he) the peculiar privilege of the pagan philosophers to amuse the mind with colours as false as their idols; and to say great things, not being capable of saying true ones." Ambrose met with a good deal of opposition from the Arians, against whom he acted with great spirit and intrepidity. Justina the empress and mother of Valentinian, who was an Arian, resolving to restore Arianism at Milan, began with demanding of St Ambrose one of the churches, which was called the Portian church: but he refused it; and the people surrounding the palace in a body, she was oblig'd to leave him in possession of his church, and even desire him to pacify the people.

Ambrose was a second time sent to the tyrant Maximus, for Valentinian found no person so proper to negotiate with him. He spoke to him with great courage and boldness, but could obtain nothing; for Maximus soon after march'd into Italy, and made himself master of the western empire: so that Valentinian was oblig'd to retire, with his mother Justina and his sister Galla, to Thessalonica in Illyricum, in order to desire Theodosius's assistance; who defeated Maximus, and restored Valentinian to the empire.

While Theodosius continued in Italy, after the defeat of Maximus, an insurrection happened at Thessalonica, in which several of the magistrates were stoned, and their bodies dragg'd along the streets. Theodosius being inform'd of this, rashly command'd a certain number of the inhabitants to be put to death promiscuously;

Ambrose. cuously; by which means the city was filled with the blood of many innocent persons, and amongst the rest several strangers who were but just come there: no regard was had to any distinction of persons; no form of trial was observed; but they were cut down like corn in the harvest, as Theodoret expresses it, to the number of 7000. At this time an assembly of bishops was held at Milan, who all expressed an abhorrence of such cruelty in the emperor. Ambrose wrote a letter to him, in which he represented the enormity of his crime, and exhorted him to make satisfaction by a sincere submission and repentance. Some time after, Theodosius coming to Milan, went to receive the sacrament at the great church; where Ambrose meeting him at the door, denied him entrance, and represented his guilt in the most forcible and pathetic terms. The emperor was struck with his words, and with great uneasiness of mind returned to his palace; but about a year after, Ambrose, being convinced of the sincerity of his repentance, admitted him into the church.

In 392, Valentinian the emperor being assassinated by the contrivance of Argobastes, and Eugenius usurping the empire, Ambrose was obliged to leave Milan; but he returned the year following, when Eugenius was defeated. He died at Milan the 4th of April 397; being 57 years of age, according to Mr Du Pin and some other writers; but Dr Cave and Olearius say that he was 64 years old at his death. He was buried in the great church at Milan. He wrote several works, the most considerable of which is that *De Officiis*. He is concise and sententious in his manner of writing, and full of turns of wit; his terms are well chosen, and his expressions noble; he diversifies his subject by an admirable copiousness of thought and language; he is very ingenious in giving an easy and natural turn to every thing which he treats of, and is not without strength and pathos when there is occasion for it. This is part of the character which Du Pin gives him as a writer; but Erasmus observes that he has many quaint and affected sentences, and frequently very obscure ones; and it is certain that his writings are intermixed with many strange and peculiar opinions. Paulinus wrote his life, and dedicated it to St Augustin: this life is prefixed to St Ambrose's works; the best edition of which is reckoned to be that published by the Benedictine monks, in two volumes in folio, at Paris, in 1686 and 1690.

AMBROSE (Isaac), an eminent presbyterian minister, was educated at Brazen-nose college Oxford, where he took the degree of bachelor of arts, and became minister of Preston, and afterwards of Garstang in Lancashire, where he was in 1662 ejected for non-conformity. It was usual with him to retire every year for a month into a little hut in a wood; where he shunned all society, and devoted himself to religious contemplation. Dr Calamy observes, that he had a very strong impulse on his mind of the approach of death, and took a formal leave of his friends at their house a little before his departure; and the last night of his life he sent his discourse concerning *angels* to the press. The next day he shut himself up in his parlour, where, to the great surprize and regret of all who saw him, he was found just expiring. He died in 1663-4, in the 72^d year of his age. He wrote several other books; as the *Prima, Media, et Ul-*

tima, or the First, Middle, and Last Things; War with devils; Looking unto Jesus; &c.

AMBROSE, or *St AMBROSE in the Wood*, an order of religious, who use the Ambrosian office, and wear an image of that saint engraven on a little plate: in other respects, they conform to the rule of the Augustines. See *AMBROSIAN Office*, and *AUGUSTINES*.

AMBROSIA, in heathen antiquity, denotes the solid food of the gods, in contradistinction from the drink, which was called *nectar*. It had the appellation *ambrosia* (compounded of the particle *a*, and *βροσιος*, *immortal*), as being supposed to render those immortal who fed on it.

AMBROSIA is also a splendid kind of title, given by some physicians to certain alexipharmic compositions, of extraordinary virtue. The name was particularly given to a famous antidote of Philip of Macedon, against all poisons, bites, and stings of venomous creatures, as well as many internal diseases.

AMBROSIA: A genus of the pentandria order, belonging to the monœcia class of plants; and, in the natural method, ranking under the 49th order, *Compositæ-nucamentaceæ*. The characters are:—The **MALE** flowers are compound: The common *calyx* is a single-leav'd perianthium, the length of the florets: The compound *corolla* is uniform, tubular, flat, and hemispherical; the proper is monopetalous, funnel-shaped, and quinquefid: The *stamina* consist of five very small filaments; the antheræ are erect, parallel, and pointed: The *pistillum* has a filiform stylus, the length of the stamina; the stigma orbicular and membranous: The *receptaculum* is naked.—**FEMALE** flowers below the male ones, on the same plant, doubled: The *calyx* is a single-leav'd perianthium, entire (with the belly quinque-dentated), one-flowered, and persistent: There is no *corolla*: The *pistillum* has an ovate germen in the bottom of the calyx; a filiform stylus, the length of the calyx; and two long bristly stigmata: The *pericarpium* is an ovate unilocular nut: The *seed* is single and roundish. Of this genus five species are enumerated; but having no properties worthy of notice, we omit any farther account of them.

AMBROSIAN OFFICE, or **RITE**, in church-history, a particular formula of worship in the church of Milan, which takes its name from St Ambrose, who instituted that office in the fourth century. Each church originally had its particular office; and when the Pope, in after-times, took upon him to impose the Roman office upon all the western churches, that of Milan sheltered itself under the name and authority of St Ambrose; from which time the Ambrosian ritual has prevailed.

AMBROSIN, in middle-age writers, denotes a coin struck by the lords or dukes of Milan, whereon was represented St Ambrose on horseback, with a whip in his right hand. The occasion of this coinage is said to have been a vision of that saint, who appeared to the Milanese general in 1339, during the time of a battle.

AMBROSINIA, in botany; a genus of the polyandria order belonging to the gynandria class of plants; the characters of which are: The *calyx* is a single-leaved spatha, divided by a partition into two cells: There is no *corolla*: The *stamina* consist of a single filament in the interior cell; the antheræ are numerous;

Ambrosia
||
Ambrosinia

Ambrosius: numerous, with two roundish concave nectaries at their base: The *pistillum* is in the interior cell; the germen roundish; the stylus cylindrical, and shorter than the spatula; the stigma obtuse: The *pericarpium* (a capsule?) roundish and unilocular. There is but one species, a native of Turkey.

AMBROSIUS AURELIANUS, or AURELIUS AMBROSIUS, a famous general of the ancient Britons, of Roman extraction. He was educated at the court of Aldroen of Amoricā; who, at the request of the Britons, sent him over with ten thousand men, to assist them against the Saxons, whom Vortigern had invited into Britain. Ambrosius had such success against the Saxons, that the Britons chose him for their king, and compelled Vortigern to give up to him all the western part of the kingdom divided by the Roman highway called *Watling-street*. Some time after, the Britons being discontented with Vortigern, and having withdrawn their allegiance from him, he returned to a castle in Wales, where being besieged by Ambrosius, and the castle taking fire, he perished in the flames, and left his rival sole monarch of Britain; who now took upon him the imperial purple, after the manner of the Roman emperors. Geoffrey of Monmouth tells us, that Ambrosius built Stonehenge near Salisbury in Wiltshire. Ambrosius, according to this historian, coming to a monastery near Caer-caradoc, now Salisbury, where three hundred British lords, massacred by Hengist, lay buried, and resolving to perpetuate the memory of this action, he ordered his workmen to prepare a large quantity of stones and other materials. But having, at the instigation of Tremonus archbishop of Caerleon, consulted the famous Merlin, this magician advised him to send over to Ireland for certain great stones, called *chorea gigantum*, the giant's dance, placed in a circle on a hill called *Killair*, having been brought thither by giants from the farthest borders of Africa. A body of forces were accordingly sent into Ireland, under Pendragon, Ambrosius's brother, to fetch these stones; but were opposed in their attempt by Gilliomanus king of the country, who derided the folly of the Britons in undertaking so ridiculous an expedition. Nevertheless, the Britons having vanquished this prince in battle, brought away the stones; and by the direction and assistance of Merlin, who had accompanied them, these wonderful stones, by order of Ambrosius, were placed over the graves of the British lords, and are now what is called *Stonehenge*. Alexander Meham celebrates this fable in his poem *De divina sapientia laudibus*. Polydore Virgil assigns another origin of Stonehenge: he tells us it was erected by the Britons as a monument to their general Ambrosius, on the place where he fell in battle, to perpetuate the memory of his glorious actions and services done to his country. Both these stories are rejected by our best antiquaries; who, however, are by no means agreed as to the true origin of this famous piece of antiquity. See **STONEHENGE**.

After the Britons had defeated the Saxons, and obliged them to retire northward, Ambrosius is said to have convened the princes and great men at York, where he gave orders for repairing the churches destroyed by the Saxons, and restoring the exercise of religion to its former lustre. This is confirmed by Matthew of Westminster; who highly applauds the great zeal of

Ambrosius in repairing the churches, encouraging the clergy, and restoring the honour of religion. The Monmouth historian gives this prince a very high character. "He was a man (says he) of such bravery and courage, that when he was in Gaul no one durst enter the lists with him; for he was sure to unhorse his antagonist, or to break his spear into shivers. He was, moreover, generous in bestowing, careful in performing religious duties, moderate in all things, and more especially abhorred a lie. He was strong on foot, stronger on horseback, and perfectly qualified to command an army." The same author tells us he was poisoned at Winchester by one Eopa a Saxon, disguised as a physician, and hired for that purpose by Pascentius one of the sons of Vortigern: but the generally received opinion is, that he was killed in a battle which he lost in the year 508, against Cerdric, one of the Saxon generals.

AMBRY, a place in which are deposited all utensils necessary for house-keeping. In the ancient abbey and priories, there was an office under this denomination, wherein were laid up all charities for the poor.

AMBUBAJÆ, in Roman antiquity, were immodest women, who came from Syria to Rome, where they lived by prostitution, and by playing on the flute: the word is derived from the Syriac *abub*, which signifies a flute; altho' others make it to come from *am* and *Baie*, because these prostitutes often retired to Baie. According to Cruquius, these women used likewise to sell paint for ornamenting the face, &c.

AMBULANT, or AMBULATORY. They give in France the name of *ambulant commissioners* to those commissioners, or clerks of the king's farms, who have no settled office; but visit all the offices within a certain district, to see that nothing be done in them against the king's right and the interest of the farm.

AMBULANT is also used to denote those brokers at Amsterdam, or exchange agents, who have not been sworn before the magistrates. They transact brokerage business, but their testimony is not received in the courts of justice.

AMBULATORY, a term anciently applied to such courts, &c. as were not fixed to any certain place; but held sometimes in one place, and sometimes in another. In opposition to stationary courts.—The court of parliament was anciently ambulatory; so also were the courts of king's bench, &c.

AMBURBIUM, in Roman antiquity, a procession made by the Romans round the city and pomerium, in which they led a victim, and afterwards sacrificed it, in order to avert some calamity that threatened the city.

AMBURY, or ANBURY, among ferriers, denotes a tumor, wart, or swelling, which is soft to the touch, and full of blood.

This disorder of horses is cured by tying a horse-hair very hard about its root; and, when it has fallen off, which commonly happens in about eight days; strewing some powder of verdigris upon the part, to prevent the return of the complaint. If the tumor be so low that nothing can be tied about it, they cut it out with a knife, or else burn it off with a sharp hot iron; and, in sinewy parts, where a hot iron is improper, they eat it away with oil of vitriol, or white sublimate.

Ambuscade ||
Amedians

Many of our farriers boast of a secret which infallibly cures all kinds of protuberances of this kind; the preparation of which is this: Take three ounces of green vitriol and one ounce of white arsenic; beat them to a coarse powder, and put them into a crucible; place the crucible in the midst of a charcoal fire, stirring the substance, but carefully avoiding the poisonous steams; when the whole grows reddish, take the crucible out of the fire, and, when cool, break it and take out the matter at the bottom; beat this to powder in a mortar, and add to four ounces of this powder five ounces of *album rhosis*; make the whole into an ointment, and let it be applied cold to warts; rubbing them with it every day. They will by this means fall off gently and easily, without leaving any swellings. It is best to keep the horse quiet, and without working, during the cure. What fores remain on the parts which the swellings fall off from, may be cured with the common application called the *countess's ointment*.

AMBUSCADE, or **AMBUSH**, in the military art, properly denotes a place where soldiers may lie concealed till they find an opportunity to surprize the enemy.

In the language of Scripture, these terms are not always taken in their proper signification, for laying ambushes for any one, attacking him in secret, laying snares for him. They sometimes signify no more than attacking a man who has no distrust of such a thing; attacking one behind, concealing one's self in some particular place in order to surprize any one. See the book of Judges, ch. ix. 25, 32, 34, 35. Abimelech, who lay lurking with his people in the heights of Sichem, so, however, as to rob and treat those who passed that way very ill, came and attacked the city of Sichem with his troops divided into three bodies: *Tetendit insidias juxta Sichimam in quatuor locis*. Literally, according to the Hebrew, "They prepared ambuscades against Sichem in four heads or companies." And a little farther, verse 43. "Abimelech being informed that the Sichemites were marched, took his army and divided it into three bodies, and laid wait for them in the field." It seems certain, that in these passages ambushes, properly so called, were not the things in question. In the first book of Samuel, Saul complains that David laid ambuscades for him: *Insidiator usque hodie permansens*. Now nothing could be worse grounded than this accusation, if we understand the word *insidiari* in its proper signification; but he might say, though unjustly, that David was his secret enemy. And in the Chronicles it is said, that God turned the ambushes laid by the enemies of Israel upon themselves; that is to say, their endeavours, their malice, their arms, he turned against themselves: for the enemies there mentioned came not in private or by stratagem; they marched openly in arms against Israel.

AMBY, a town of the Austrian Netherlands, in the province of Limburg, situated opposite to Maestricht, on the east side of the river Maese, in E. Long. 5. 45. N. Lat. 50. 57.

AMEDIANS, in church-history, a congregation of religious in Italy, so called from their professing themselves *amantes Deum*, "lovers of God;" or rather *amati Deo*, "beloved of God." They wore a grey habit and wooden shoes, had no breeches, and girt

N^o 14.

themselves with a cord. They had 28 convents; and were united by Pope Pius V. partly with the Cistercian order, and partly with that of the Soccolanti, or wooden-shoe wearers.

AMELIA, an episcopal city of Italy, in the state of the church, seated on a mountain, in the duchy of Spoleto. E. Long. 13. 20. N. Lat. 42. 33.

AMELLUS, **STARWORT**: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositae-oppositifoliae*. The characters are: The common calyx is imbricated and roundish: The compound corolla is radiated; the hermaphrodite corollas numerous in the disk; the female numerous in the ray: Proper corolla of the hermaphrodites are tubular and quinquefid; of the females, tongued, loose, and two or three toothed: The *stamina* in the hermaphrodites consist of five short capillary filaments; the anthera cylindric and tubular: The *pisillum* has an ovate germen; a filiform stylus the length of the stamina; and two filiform stigmata: There is no *pericarpium*, but the calyx unchanged: The *seeds* are ovate and solitary; the *pappus* is hairy; the *receptaculum* chaffy.—Of this there are two

Species. 1. The lynchitis, with one flower on each footstalk. This is a native of the Cape of Good Hope. It is a perennial plant, rising about three feet high, sending out many branches on each side, so as to form a bushy plant; the branches are garnished with obtuse spear-shaped leaves placed opposite, and are terminated by single naked flower-stalks, each supporting one violet-coloured flower, having a yellow disk, which is succeeded by oblong seeds. 2. The umbellatus, with flowers growing in umbels, is a native of Jamaica; and rises from two to three feet high, sending out many branches clothed with opposite leaves, which are terminated by small flowers in umbels.

Culture. The first is easily propagated, either by cuttings planted in the summer-months, or by seeds sown on a moderate hot-bed in the spring, but the plants require a slight shelter in winter. The second is much more tender, and therefore requires to be preserved in a stove during the winter season.

AMELOT DE LA HOUSSAI (Nicholas), born at Orleans in 1634, was much esteemed at the court of France, and appointed secretary of an embassy which that court sent to the commonwealth of Venice, as appears by the title of his translation of Father Paul's History of the Council of Trent; but he afterwards published writings which gave such offence, that he was imprisoned in the Bastille. The first works he printed were the History of the Government of Venice, and that of the Uscoks, a people of Croatia. In 1683 he published his translations into French of Machiavel's Prince, and Father Paul's History of the Council of Trent, and Political Discourses of his own upon Tacitus. These performances were well received by the public. He did not prefix his own name to the two last mentioned works, but concealed himself under that of La Mothe Joffeval. His translation of Father Paul was attacked by the partisans of the pope's unbounded power and authority. In France, however, it met with great success; all the advocates for the liberty of the Gallican church promoting the success of it to the utmost of their power, though at the same time there were three memorials presented

Amelia,
Anellus.

Amelot,
Amen.

presented to have it suppressed. When the second edition of this translation was published, it was violently attacked by the Abbé St Real, in a letter he wrote to Mr Bayle, dated October 17. 1685. Amelot defended himself, in a letter to the same gentleman. In 1684, he printed at Paris a French translation of Baltasar Gracian's *Oraculo manual*, with the title of *P'Homme de Cour*. In 1686, he printed *La Morale de Tacite de la flaterie*; in which work he collected several particular facts and maxims, which represent in a strong light the artifices of court-flatterers, and the mischievous effect of their poisonous discourses. Frederick Leonard, a bookfeller at Paris, having proposed, in the year 1692, to print a collection of all the treaties of peace between the kings of France and all the other princes of Europe, since the reign of Charles VII. to the year 1690, Amelot published a small volume in duodecimo, containing a preliminary discourse upon these treaties; wherein he endeavours to show, that most princes, when they enter into a treaty, think more how to evade than how to perform the terms they subscribe to. He published also an edition of Cardinal d'Ossat's Letters in 1697, with several observations of his own; which, as he tells us in his advertisement, may serve as a supplement to the history of the reigns of Henry III. and Henry IV. kings of France. He wrote several other works; and died at Paris in 1706, being then almost 73 years of age.

AMELOT (Denis), a celebrated French writer, was born at Saintonge in 1606. He maintained a close correspondence with the fathers of the Oratory, a congregation of priests founded by Philip of Neri. He wrote the life of Charles de Gondren, second superior of this congregation, and published it at Paris in 1643. In this piece he said something of the famous Abbot of St Cyran, which greatly displeased the gentlemen of Port Royal; who, to be revenged of him, published a libel against him, intitled *Idee generale l'esprit et de livre de P. Amelote*. He was so much provoked by this satire, that he did all in his power to injure them. They had finished a translation of the New Testament, and were desirous to have it published; for which purpose they endeavoured to procure an approbation from the doctors of the Sorbonne, and a privilege from the king. But Amelot, by his influence with the Chancellor, prevented them from succeeding. In this he had also a view to his own interest; for he was about to publish a translation of his own of the New Testament. Amelot's translation with annotations, in 4 vols octavo, was printed in the years 1666, 1667, and 1668. It is not very exact, according to F. Simon, who tells us that it contains some very gross blunders. Amelot wrote also an Abridgment of Divinity, a Catechism for the Jubilee, and a kind of Christian Manual for every Day. Towards the end of his life, he entered into the congregation of the Oratory in 1650; and continued amongst them till his death, which happened in 1678.

AMEN, *אמן*, signifies *true, faithful, certain*. It is made use of likewise to affirm any thing, and was a sort of affirmation used often by our Saviour: *Αμην, Αμην, λεγω υμιν*. i. e. *Verily, verily, I say unto you*. Lastly, it is understood as expressing a wish; as *Amen, So be it*, Numb. v. 22. or an affirmation, *Amen, yes, I*

VOL. I. Part II.

believe it, 1 Cor. xiv. 16. The Hebrews and the five books of Psalms, according to their way of distributing them, with the words *amen, amen*; which the Septuagint have translated *γενοιτο, γενοιτο*; and the Latins *fiat, fiat*. The Greek and Latin churches have preserved this word in their prayers, as well as *alleluiab* and *hosanna*; because they observed more energy in them than in any terms which they could use in their own languages. At the conclusion of the public prayers, the people answered with a loud voice, *Amen*; and St Jerom says, that at Rome when the people answered *Amen*, the sound of their voices was like a clap of thunder: *In similitudinem celestis tonitruui Amen resonat*. The Jews assert that the gates of heaven are opened to him who answers *Amen* with all his might.

AMEND, or AMENDE, in the French customs, a pecuniary punishment imposed by a judge for any crime, false prosecution, or groundless appeal.

AMENDE *Honourable*, an infamous kind of punishment inflicted in France upon traitors, parricides, or sacrilegious persons, in the following manner: The offender being delivered into the hands of the hangman, his shirt is stripped off, a rope put about his neck, and a taper in his hand; then he is led into court, where he must beg pardon of God, the king, the court, and his country. Sometimes the punishment ends here; but sometimes it is only a prelude to death, or banishment to the galleys.

AMENDE *Honourable*, is a term also used for making recantation in open court, or in presence of the person injured.

AMENDMENT, in a general sense, denotes some alteration or change made in a thing for the better.

AMENDMENT, in law, the correction of an error committed in a process, which may be amended after judgment, unless the error lies in giving judgment; for in that case it is not amendable, but the party must bring a writ of error. A bill may be amended on the file at any time before the plea is pleaded; but not afterwards, without motion and leave of the court.

AMENDMENT of a Bill, in parliament, is some alteration made in the first draught of it.

AMENTUM, in botany, the name of a species of calyx, consisting of valves, and hanging down in different directions from the caulis. Common oats afford a good example of the amentum.

AMENTUM, in Roman antiquity, a thong tied about the middle of a javelin or dart, and fastened to the forefinger, in order to recover the weapon as soon as it was discharged. The ancients made great use of the amentum, thinking it helped to enforce the blow. It also denotes a latchet that bound their sandals.

AMERADE, a kind of officers among the Saracens, answering to the governors of provinces among the Europeans.—The name is originally the same with that of emir.

AMERCEMENT, or AMERCIAMENT, in law, a pecuniary punishment imposed on offenders at the mercy of the court. It differs from a fine in being imposed arbitrarily in proportion to the fault; whereas a fine is a certain punishment settled expressly by some statute.

AMERICA (from *Americus Vesputius*, falsely said to be the first discoverer of the continent); one of the

Amend
||
America.

America. four quarters of the world, probably the largest of the whole, and from its late discovery frequently denominated the *New World*.

1
Boundaries.

This vast country extends from the 80th degree of north, to the 56th degree of south latitude; and, where its breadth is known, from the 35th to the 136th degree west longitude from London; stretching between 8000 and 9000 miles in length, and in its greatest breadth 3690. It sees both hemispheres, has two summers and a double winter, and enjoys all the variety of climates which the earth affords. It is washed by the two great oceans. To the eastward it has the Atlantic, which divides it from Europe and Africa; to the west it has the Pacific or Great South Sea, by which it is separated from Asia. By these seas it may, and does, carry on a direct commerce with the other three parts of the world.

2
North and South continent.

America is not of equal breadth throughout its whole extent; but is divided into two great continents, called *North* and *South America*, by an isthmus 1500 miles long, and which at Darien, about Lat. 9° N. is only 60 miles over. This isthmus forms, with the northern and southern continents, a vast gulph, in which lie a great number of islands, called the *West Indies*, in contradistinction to the eastern parts of Asia, which are called the *East Indies*.

3
Remarkable prevalence of cold.

Between the New World and the Old, there are several very striking differences; but the most remarkable is the general predominance of cold throughout the whole extent of America. Though we cannot, in any country, determine the precise degree of heat merely by the distance of the equator, because the elevation above the sea, the nature of the soil, &c. affect the climate; yet, in the ancient continent, the heat is much more in proportion to the vicinity to the equator than in any part of America. Here the rigour of the frigid zone extends over half that which should be temperate by its position. Even in those latitudes where the winter is scarcely felt on the Old continent, it reigns with great severity in America, though during a short period. Nor does this cold, prevalent in the New World, confine itself to the temperate zones; but extends its influence to the torrid zone also, considerably mitigating the excess of its heat.—Along the eastern coast, the climate, though more similar to that of the torrid zone in other parts of the earth, is nevertheless considerably milder than in those countries of Asia and Africa which lie in the same latitude. From the southern tropic to the extremity of the American continent, the cold is said to be much greater than in parallel northern latitudes even of America itself.

For this so remarkable difference between the climate of the New continent and the Old, various causes have been assigned by different authors. The following is the opinion of the learned Dr Robertson on this subject. “Though the utmost extent of America towards the north be not yet discovered, we know that it advances nearer to the pole than either Europe or Asia. The latter have large seas to the north, which are open during part of the year; and, even when covered with ice, the wind that blows over them is less intensely cold than that which blows over land in the same latitudes. But, in America, the land stretches from the river St Lawrence towards the pole, and spreads out immensely to the west. A chain of enormous moun-

4
Dr Robertson's reasons for this superior degree of cold.
History of America, vol. I. p. 253.

tains, covered with snow and ice, runs through all this dreary region. The wind passing over such an extent of high and frozen land, becomes so impregnated with cold, that it acquires a piercing keenness, which it retains in its progress through warmer climates; and is not entirely mitigated until it reach the gulph of Mexico. Over all the continent of North America, a north-westerly wind and excessive cold are synonymous terms. Even in the most sultry weather, the moment that the wind veers to that quarter, its penetrating influence is felt in a transition from heat to cold no less violent than sudden. To this powerful cause we may ascribe the extraordinary dominion of cold, and its violent inroads into the southern provinces in that part of the globe.

“Other causes, no less remarkable, diminish the active power of heat in those parts of the American continent which lie between the tropics. In all that portion of the globe, the wind blows in an invariable direction from east to west. As this wind holds its course across the ancient continent, it arrives at the countries which stretch along the western shore of Africa, inflamed with all the fiery particles which it hath collected from the sultry plains of Asia, and the burning sands in the African deserts. The coast of Africa is accordingly the region of the earth which feels the most fervent heat, and is exposed to the unmitigated ardour of the torrid zone. But this same wind, which brings such an accession of warmth to the countries lying between the river of Senegal and Cafraria, traverses the Atlantic ocean before it reaches the American shore. It is cooled in its passage over this vast body of water; and is felt as a refreshing gale along the coasts of Brazil and Guiana, rendering those countries, tho’ amongst the warmest in America, temperate, when compared with those which lie opposite to them in Africa. As this wind advances in its course across America, it meets with immense plains covered with impenetrable forests; or occupied by large rivers, marshes, and stagnating waters, where it can recover no considerable degree of heat. At length it arrives at the Andes, which run from north to south thro’ the whole continent. In passing over their elevated and frozen summits, it is so thoroughly cooled, that the greater part of the countries beyond them hardly feel the ardour to which they seem exposed by their situation. In the other provinces of America, from Terra Firma westward to the Mexican empire, the heat of the climate is tempered, in some places, by the elevation of the land above the sea; in others, by their extraordinary humidity; and in all, by the enormous mountains scattered over this tract. The islands of America in the torrid zone are either small or mountainous, and are fanned alternately by refreshing sea and land breezes.

“The causes of the extraordinary cold towards the southern limits of America, and in the seas beyond it, cannot be ascertained in a manner equally satisfying. It was long supposed, that a vast continent, distinguished by the name of *Terra Australis Incognita*, lay between the southern extremity of America and the antarctic pole. The same principles which account for the extraordinary degree of cold in the northern regions of America, were employed in order to explain that which is felt at Cape Horn and the adjacent countries. The immense extent of the southern continent, and the

^{America.} rivers which it poured into the ocean, were mentioned and admitted by philosophers as causes sufficient to occasion the unusual sensation of cold, and the still more uncommon appearances of frozen seas in that region of the globe. But the imaginary continent to which such influence was ascribed having been searched for in vain, and the space which it was supposed to occupy having been found to be an open sea; new conjectures must be formed with respect to the causes of a temperature of climate, so extremely different from that which we experience in countries removed at the same distance from the opposite pole.

^{Thid. p. 451. note xxxi.} "The most obvious and probable cause of this superior degree of cold towards the southern extremity of America, seems to be the form of the continent there. Its breadth gradually decreases as it stretches from St Antonio southwards, and from the bay of St Julian to the straits of Magellan its dimensions are much contracted. On the east and west sides, it is washed by the Atlantic and Pacific oceans. From its southern point, it is probable that an open sea stretches to the antarctic pole. In whichever of these directions the wind blows, it is cooled before it approaches the Magellanic regions, by passing over a vast body of water; nor is the land there of such extent, that it can recover any considerable degree of heat in its progress over it. These circumstances concur in rendering the temperature of the air in this district of America, more similar to that of an insular, than to that of a continental climate; and hinder it from acquiring the same degree of summer-heat, with places in Europe and Asia, in a corresponding northern latitude. The north wind is the only one that reaches this part of America, after blowing over a great continent. But, from an attentive survey of its position, this will be found to have a tendency rather to diminish than augment the degree of heat. The southern extremity of America is properly the termination of the immense ridge of the Andes, which stretches nearly in a direct line from north to south, through the whole extent of the continent. The most sultry regions in South America, Guiana, Brasil, Paraguay, and Tucuman, lie many degrees to the east of the Magellanic regions. The level country of Peru, which enjoys the tropical heats, is situated considerably to the west of them. The north wind, then, though it blows over land, does not bring to the southern extremity of America an increase of heat collected in its passage over torrid regions; but, before it arrives there, it must have swept along the summit of the Andes, and come impregnated with the cold of that frozen region."

⁵ Another particularity in the climate of America is its excessive moisture in general. In some places, indeed, on the western coast, rain is not known; but, in all other parts, the moistness of the climate is as remarkable as the cold.—The forests wherewith it is every where covered, no doubt, partly occasion the moisture of its climate; but the most prevalent cause is the vast quantity of water in the Atlantic and Pacific Oceans, with which America is environed on all sides. Hence those places where the continent is narrowest are deluged with almost perpetual rains, accompanied with violent thunder and lightning, by which some of them, particularly Porto Bello, are rendered in a manner uninhabitable.

This extreme moisture of the American climate is productive of much larger rivers there than in any other part of the world. The Danube, the Nile, the Indus, or the Ganges, are not comparable to the Mississippi, the River St Laurence, or that of the Amazons; nor are such large lakes to be found any where as those which North America affords.—To the same cause we are also partly to ascribe the excessive luxuriance of all kinds of vegetables in almost all parts of this country. In the southern provinces, where the moisture of the climate is aided by the warmth of the sun, the woods are almost impervious, and the surface of the ground is hid from the eye, under a thick covering of shrubs, herbs, and weeds.—In the northern provinces, the forests are not encumbered with the same luxuriance of vegetation; nevertheless, they afford trees much larger of their kind than what are to be found any where else.

From the coldness and the moisture of America, an extreme malignity of climate has been inferred, and ascribed by M. de Paw in his *Recherches Philosophiques*. Hence, according to his hypothesis, the smallness and irregularity of the nobler animals, and the size and enormous multiplication of reptiles and insects.

But the supposed smallness and less ferocity of the American animals, the Abbé Clavigero observes, instead of the malignity, demonstrates the mildness and bounty of the clime, if we give credit to Buffon, at whose fountain M. de Paw has drank, and of whose testimony he has availed himself against Don Pernetty. Buffon, who in many places of his Natural History produces the smallness of the American animals as a certain argument of the malignity of the climate of America; in treating afterwards of savage animals, in Tom. II. speaks thus: "As all things, even the most free creatures, are subject to natural laws, and animals as well as men are subjected to the influence of climate and soil, it appears that the same causes which have civilized and polished the human species in our climates, may have likewise produced similar effects upon other species. The wolf, which is perhaps the fiercest of all the quadrupeds of the temperate zone, is however incomparably less terrible than the tyger, the lion, and the panther of the torrid zone; and the white bear and hyena of the frigid zone. In America, where the air and the earth are more mild than those of Africa, the tyger, the lion, and the panther, are not terrible but in the name. They have degenerated, if fierceness, joined to cruelty, made their nature; or, to speak more properly, they have only suffered the influence of the climate: under a milder sky their nature also has become more mild. From climes which are immoderate in their temperature are obtained drugs, perfumes, poisons, and all those plants whose qualities are strong. The temperate earth, on the contrary, produces only things which are temperate; the mildest herbs, the most wholesome pulse, the sweetest fruits, the most quiet animals, and the most humane men, are the natives of this happy clime. As the earth makes the plants, the earth and plants make animals; the earth, the plants, and the animals make man. The physical qualities of man, and the animals which feed on other animals, depend, though more remotely, on the same causes which influence their dispositions and customs. This is the greatest proof and demonstration, that in temperate climes every thing becomes temperate, and that in in-

America. temperate climes every thing is excessive; and that size and form, which appear fixed and determinate qualities, depend notwithstanding, like the relative qualities, on the influence of climate. The size of our quadrupeds cannot be compared with that of an elephant, the rhinoceros, or sea-horse. The largest of our birds are but small if compared with the ostrich, the condore, and *cafoare*." So far M. Buffon, whose text we have copied, because it is contrary to what M. de Paw writes against the climate of America, and to Buffon himself in many other places.

If the large and fierce animals are natives of intemperate climes, and small and tranquil animals of temperate climes, as M. Buffon has here established; if mildness of climate influences the disposition and customs of animals, M. de Paw does not well deduce the malignity of the climate of America from the smaller size and less fierceness of its animals; he ought rather to have deduced the gentleness and sweetness of its climate from this antecedent. If, on the contrary, the smaller size and less fierceness of the American animals, with respect to those of the old continent, are a proof of their degeneracy, arising from the malignity of the climate, as M. de Paw would have it, we ought in like manner to argue the malignity of the climate of Europe from the smaller size and less fierceness of its animals, compared with those of Africa. If a philosopher of the country of Guinea should undertake a work in imitation of M. de Paw, with this title, *Recherches Philosophiques sur les Europeens*, he might avail himself of the same argument which M. de Paw uses, to demonstrate the malignity of the climate of Europe, and the advantages of that of Africa. The climate of Europe, he would say, is very unfavourable to the production of quadrupeds, which are found incomparably smaller, and more cowardly than ours. What are the horse and the ox, the largest of its animals, compared with our elephants, our rhinoceroses, our sea-horses, and our camels? What are its lizards, either in size or intrepidity, compared with our crocodiles? Its wolves, its bears, the most dreadful of its wild beasts, when beside our lions and tygers? Its eagles, its vultures, and cranes, if compared with our ostriches, appear only like hens.

3
America
not more
infested
than other
countries
with insects
and noxious
animals.

As to the enormous size and prodigious multiplication of the insects and other little noxious animals, "The surface of the earth (says M. de Paw), infested by putrefaction, was over-run with lizards, serpents, reptiles, and insects monstrous for size, and the activity of their poison, which they drew from the copious juices of this uncultivated soil, that was corrupted and abandoned to itself, where the nutritive juice became sharp, like the milk in the breast of animals which do not exercise the virtue of propagation. Caterpillars, crabs, butterflies, beetles, spiders, frogs, and toads, were for the most part of an enormous corpulence in their species, and multiplied beyond what can be imagined. Panama is infested with serpents, Carthage with clouds of enormous bats, Portobello with toads, Surinam with *kakerlacs* or *cucarachas*, Guadaloupe, and the other colonies of the islands, with beetles, Quito with niguas or chegoes, and Lima with lice and bugs. The ancient kings of Mexico, and the emperors of Peru, found no other means of ridding their subjects of those insects which fed upon them, than the imposition of an annual tribute of a certain quantity of lice.

America. Ferdinand Cortes found bags full of them in the palace of Montezuma." But this argument, exaggerated as it is, proves nothing against the climate of America in general, much less against that of Mexico. There being some lands in America, in which, on account of their heat, humidity, or want of inhabitants, large insects are found, and excessively multiplied, will prove at most, that in some places the surface of the earth is infested, as he says, with putrefaction; but not that the soil of Mexico, or that of all America, is stinking, uncultivated, vitiated, and abandoned to itself. If such a deduction were just, M. de Paw might also say, that the soil of the old continent is barren, and stinks; as in many countries of it there are prodigious multitudes of monstrous insects, noxious reptiles, and vile animals, as in the Philippine Isles, in many of those of the Indian archipelago, in several countries of the south of Asia, in many of Africa, and even in some of Europe. The Philippine Isles are infested with enormous ants and monstrous butterflies; Japan with scorpions; South of Asia and Africa with serpents; Egypt with asps; Guinea and Ethiopia with armies of ants; Holland with field-rats; Ukrania with toads, as M. de Paw himself affirms. In Italy, the Campagna di Roma (although peopled for so many ages), with vipers; Calabria with tarantulas; the shores of the Adriatic sea with clouds of gnats; and even in France, the population of which is so great and so ancient, whose lands are so well cultivated, and whose climate is so celebrated by the French, there appeared, a few years ago, according to M. Buffon, a new species of field-mice, larger than the common kind, called by him *Surmulots*, which have multiplied exceedingly, to the great damage of the fields. M. Bazin, in his Compendium of the History of Insects, numbers 77 species of bugs, which are all found in Paris and its neighbourhood. That large capital, as Mr Bomare says, swarms with those disgusting insects. It is true that there are places in America, where the multitude of insects, and filthy vermin, make life irksome; but we do not know that they have arrived to such excess of multiplication as to depopulate any place, at least there cannot be so many examples produced of this cause of depopulation in the new as in the old continent, which are attested by Theophrastus, Varro, Pliny, and other authors. The frogs depopulated one place in Gaul, and the locusts another in Africa. One of the Cyclades was depopulated by mice; Amiclas, near to Taracina, by serpents; another place, near to Ethiopia, by scorpions and poisonous ants; and another by scolopendras; and not so distant from our own times, the Mauritius was going to have been abandoned on account of the extraordinary multiplication of rats, as we can remember to have read in a French author.

With respect to the size of the insects, reptiles, and such animals, M. de Paw makes use of the testimony of Mr Dumont, who, in his Memoirs on Louisiana, says, that the frogs are so large there that they weigh 37 French pounds, and their horrid croaking imitates the bellowing of cows. But M. de Paw himself says (in his answer to Don Pernetty, cap. 17.), that all those who have written about Louisiana from Henepin, Le Clerc, and Cav. Ponti, to Dumont, have contradicted each other, sometimes on one and sometimes on another

ther subject. In fact, neither in the old or the new continent are there frogs of 37 pounds in weight; but there are in Asia and Africa serpents, butterflies, ants, and other animals of such monstrous size, that they exceed all those which have been discovered in the new world. We know very well, that some American historian says, that a certain gigantic species of serpents is to be found in the woods, which attract men with their breath, and swallow them up; but we know also that several historians, both ancient and modern, report the same thing of the serpents of Asia, and even something more. Megasthenes, cited by Pliny, said, that there were serpents found in Asia, so large, that they swallowed entire stags and bulls. Metrodorus, cited by the same author, affirms, that in Asia there were serpents which, by their breath, attracted birds, however high they were, or quick their flight. Among the moderns, Gemelli, in Vol. V. of his Tour of the World, when he treats of the animals of the Philippine isles, speaks thus: "There are serpents in these islands of immoderate size; there is one called *Ibitin*, very long, which suspending itself by the tail from the trunk of a tree, waits till stags, bears, and also men pass by, in order to attract them with its breath, and devour them at once entirely:" from whence it is evident, that this very ancient fable has been common to both continents.

Further, it may be asked, In what country of America could M. de Paw find ants to equal those of the Philippine islands, called *Sulum*, respecting which Hernandez affirms, that they are six fingers broad in length and one in breadth? Who has ever seen in America butterflies so large as those of Bourbon, Ternate, the Philippine isles, and all the Indian archipelago? The largest bat of America (native to hot shady countries), which is that called by Buffon *Vampiro*, is, according to him, of the size of a pigeon. *La Rougette*, one of the species of Asia, is as large as a raven; and the *Rousette*, another species of Asia, is as big as a large hen. Its wings, when extended, measure from tip to tip three Parisian feet, and according to Gemelli, who measured it in the Philippine isles, six palms. M. Buffon acknowledges the excess in size of the Asiatic bat over the American species, but denies it as to number. Gemelli says, that those of the island of Luzon were so numerous that they darkened the air, and that the noise which they made with their teeth, in eating the fruits of the woods, was heard at the distance of two miles. M. de Paw says, in talking of serpents, "it cannot be affirmed that the new world has shown any serpents larger than those which Mr Adanson saw in the deserts of Africa." The greatest serpent found in Mexico, after a diligent search made by Hernandez, was 18 feet long: but this is not to be compared with that of the Moluccas, which Bomare says is 33 feet in length; nor with the *Anscandaja* of Ceylon, which the same author says is more than 33 feet long: nor with others of Asia and Africa, mentioned by the same author. Lastly, the argument drawn from the multitude and size of the American insects is fully as weighty as the argument drawn from the smallness and scarcity of quadrupeds, and both detect the same ignorance, or rather the same voluntary and studied forgetfulness, of the things of the old continent.

With respect to what M. de Paw has said of the tribute of lice in Mexico, in that as well as in many other

things he discovers his ridiculous credulity. It is true that Cortes found bags of lice in the magazines of the palace of king Axajacatl. It is also true, that Montezuma imposed such a tribute, not on all his subjects however, but only on those who were beggars; not on account of the extraordinary multitude of those insects, as M. de Paw affirms, but because Montezuma, who could not suffer idleness in his subjects, resolved that that miserable set of people, who could not labour, should at least be occupied in lousing themselves. This was the true reason of such an extravagant tribute, as Torquemada, Betancourt, and other historians relate; and nobody ever before thought of that which M. de Paw affirms, merely because it suited his preposterous system. Those disgusting insects possibly abound as much in the hair and cloaths of American beggars, as of any poor and uncleanly low people in the world: but there is not a doubt, that if any sovereign of Europe was to exact such a tribute from the poor in his dominions, not only bags, but great vessels might be filled with them.

At the time America was discovered, it was found inhabited by a race of men no less different from those in the other parts of the world, than the climate and natural productions of this continent are different from those of Europe, Asia, or Africa.—One great peculiarity in the native Americans is their colour, and the identity of it throughout the whole extent of the continent. In Europe and Asia, the people who inhabit the northern countries are of a fairer complexion than those who dwell more to the southward. In the torrid zone, both in Africa and Asia, the natives are entirely black, or the next thing to it. This, however, must be understood with some limitation. The people of Lapland, who inhabit the most northerly part of Europe, are by no means so fair as the inhabitants of Britain; nor are the Tartars so fair as the inhabitants of Europe, who lie under the same parallels of latitude. Nevertheless, a Laplander is fair when compared with an Abyssinian, and a Tartar if compared with a native of the Molucca islands.—In America, this distinction of colour was not to be found. In the torrid zone there were no negroes, and in the temperate and frigid zones there were no white people. All of them were of a kind of red copper-colour, which Mr Forster observed, in the Pesserays of Terra del Fuego, to have something of a gloss resembling that metal. It doth not appear, however, that this matter hath ever been inquired into with sufficient accuracy. The inhabitants of the inland parts of South America, where the continent is widest, and consequently the influence of the sun the most powerful, have never been compared with those of Canada, or more northerly parts, at least by any person of credit. Yet this ought to have been done, and that in many instances too, before it could be asserted so positively as most authors do, that there is not the least difference of complexion among the natives of America. Indeed, so many systems have been formed concerning them, that it is very difficult to obtain a true knowledge of the most simple facts.—If we may believe the Abbé Raynal, the Californians are swarther than the Mexicans; and so positive is he in this opinion, that he gives a reason for it. "This difference of colour," says he, "proves, that the civilized life of society subverts, or totally changes, the order and laws of nature, since

America. we find, under the temperate zone, a savage people that are blacker than the civilized nations of the torrid zone." —On the other hand, Dr Robertson classes all the inhabitants of Spanish America together with regard to colour, whether they are civilized or uncivilized; and when he speaks of California, takes no notice of any peculiarity in their colour more than others.—The general appearance of the indigenous Americans in various districts is thus described by the chevalier Pinto: "They are all of a copper colour, with some diversity of shade, not in proportion to their distance from the Equator, but according to the degree of elevation of the territory in which they reside. Those who live in a high country are fairer than those in the marshy low lands on the coast. Their face is round; farther removed, perhaps, than that of any people, from an oval shape. Their fore-head is small; the extremity of their ears far from the face; their lips thick; their nose flat; their eyes black, or of a chestnut colour, small, but capable of discerning objects at a great distance. Their hair is always thick and sleek, and without any tendency to curl. At the first aspect, a South-American appears to be mild and innocent; but, on a more attentive view, one discovers in his countenance something wild, distrustful, and sullen."

10
Don Ulloa's
account. The following account of the native Americans is given by Don Antonio Ulloa, in a work intitled *Memoires philosophiques, historiques, et physiques, concernant la decouverte de l' Amerique*, lately published.

The American Indians are naturally of a colour bordering upon red. Their frequent exposure to the sun and wind changes it to their ordinary dusky hue. The temperature of the air appears to have little or no influence in this respect. There is no perceptible difference in complexion between the inhabitants of the high and those of the low parts of Peru; yet the climates are of an extreme difference. Nay, the Indians who live as far as 40 degrees and upwards south or north of the equator, are not to be distinguished, in point of colour, from those immediately under it.

There is also a general conformation of features and person, which, more or less, characterizeth them all. Their chief distinctions in these respects are a small forehead, partly covered with hair to the eye-brows, little eyes, the nose thin, pointed, and bent towards the upper lip; a broad face, large ears, black, thick, and lank hair; the legs well formed, the feet small, the body thick and muscular; little or no beard on the face, and that little never extending beyond a small part of the chin and upper lip. It may easily be supposed that this general description cannot apply, in all its parts, to every individual; but all of them partake so much of it, that they may be easily distinguished even from the mulattoes, who come nearest to them in point of colour.

The resemblance among all the American tribes is not less remarkable in respect to their genius, character, manners, and particular customs. The most distant tribes are, in these respects, as similar as though they formed but one nation.

All the Indian nations have a peculiar pleasure in painting their bodies of a red colour, with a certain species of earth. The mine of Guancavelica was formerly of no other use than to supply them with this material for dyeing their bodies; and the cinnabar ex-

tracted from it was applied entirely to this purpose. The tribes in Louisiana and Canada have the same passion; hence minium is the commodity most in demand there.

It may seem singular that these nations, whose natural colour is red, should affect the same colour as an artificial ornament. But it may be observed, that they do nothing in this respect but what corresponds to the practice of Europeans, who also study to heighten and display to advantage the natural red and white of their complexions. The Indians of Peru have now indeed abandoned the custom of painting their bodies: but it was common among them before they were conquered by the Spaniards; and it still remains the custom of all those tribes who have preserved their liberty. The northern nations of America, besides the red colour which is predominant, employ also black, white, blue, and green, in painting their bodies.

The adjustment of these colours is a matter of as great consideration with the Indians of Louisiana and the vast regions extending to the north, as the ornaments of dress among the most polished nations. The business itself they call *Maftaber*, and they do not fail to apply all their talents and assiduity to accomplish it in the most finished manner. No lady of the greatest fashion ever consulted her mirror with more anxiety, than the Indians do while painting their bodies. The colours are applied with the utmost accuracy and address. Upon the eye-lids, precisely at the root of the eye lashes, they draw two lines as fine as the smallest thread; the same upon the lips, the openings of the nostrils, the eye-brows, and the ears; of which last they even follow all the inflexions and sinuosities. As to the rest of the face, they distribute various figures, in all which the red predominates, and the other colours are assorted so as to throw it out to the best advantage. The neck also receives its proper ornaments; a thick coat of vermilion commonly distinguishes the cheeks. Five or six hours are requisite for accomplishing all this with the nicety which they affect. As their first attempts do not always succeed to their wish, they efface them, and begin a-new upon a better plan. No coquette is more fastidious in her choice of ornament, none more vain when the important adjustment is finished. Their delight and self-satisfaction are then so great, that the mirror is hardly ever laid down. An Indian *Maftached* to his mind is the vainest of all the human species. The other parts of the body are left in their natural state, and, excepting what is called a *cachecul*, they go entirely naked.

Such of them as have made themselves eminent for bravery, or other qualifications, are distinguished by figures painted on their bodies. They introduce the colours by making punctures on their skin, and the extent of surface which this ornament covers is proportioned to the exploits they have performed. Some paint only their arms, others both their arms and legs; others again their thighs, while those who have attained the summit of warlike renown, have their bodies painted from the waist upwards. This is the heraldry of the Indians; the devices of which are probably more exactly adjusted to the merits of the persons who bear them, than those of more civilized countries.

Besides these ornaments, the warriors also carry
plumes

America.

II
Peculiarities in regard to ornament and dress.

America. plumes of feathers on their heads, their arms, and ancles. These likewise are tokens of valour, and none but such as have been thus distinguished may wear them.

The propensity to indolence is equal among all the tribes of Indians, civilized or savage. The only employment of those who have preserved their independence is hunting and fishing. In some districts the women exercise a little agriculture, in raising Indian corn and pumpions, of which they form a species of aliment, by bruising them together: they also prepare the ordinary beverage in use among them, taking care, at the same time, of the children, of whom the fathers take no charge.

The female Indians of all the conquered regions of South America practise what is called the *urcu* (a word which among them signifies *elevation*). It consists in throwing forward the hair from the crown of the head upon the brow, and cutting it round from the ears to above the eye; so that the forehead and eye-brows are entirely covered. The same custom takes place in the Northern countries. The female inhabitants of both regions tie the rest of their hair behind, so exactly on the same fashion, that it might be supposed the effect of mutual imitation. This however being impossible, from the vast distance that separates them, is thought to countenance the supposition of the whole of America being originally planted with one race of people.

This custom does not take place among the males. Those of the higher parts of Peru wear long and flowing hair, which they reckon a great ornament. In the lower parts of the same country they cut it short, on account of the heat of the climate; a circumstance in which they imitate the Spaniards. The inhabitants of Louisiana pluck out their hair by the root, from the crown of the head forwards, in order to obtain a large forehead, otherwise denied them by nature. The rest of their hair they cut as short as possible, to prevent their enemies from seizing them by it in battle, and also to prevent them from easily getting their scalp, should they fall into their hands as prisoners.

The whole race of American Indians is distinguished by thickness of skin and hardness of fibres; circumstances which probably contribute to that insensibility to bodily pain for which they are remarkable. An instance of this insensibility occurred in an Indian who was under the necessity of submitting to be cut for the stone. This operation, in ordinary cases, seldom lasts above four or five minutes. Unfavourable circumstances in his case prolonged it to the uncommon period of 27 minutes. Yet all this time the patient gave no tokens of the extreme pain commonly attending this operation: he complained only as a person does who feels some slight uneasiness. At last the stone was extracted. Two days after, he expressed a desire for food, and on the eighth day from the operation he quitted his bed, free from pain, although the wound was not yet thoroughly closed. The same want of sensibility is observed in cases of fractures, wounds, and other accidents of a similar nature. In all these cases their cure is easily effected, and they seem to suffer less present pain than any other race of men. The skulls that have been taken up in their ancient burying-grounds are of a greater thickness than that bone is commonly found, being from six to seven lines from

the outer to the inner superficies. The same is remarked as to the thickness of their skins. America.

It is natural to infer from hence, that their comparative insensibility to pain is owing to a coarser and stronger organization, than that of other nations. The ease with which they endure the severities of climate is another proof of this. The inhabitants of the higher parts of Peru live amidst perpetual frost and snow. Although their clothing is very slight, they support this inclement temperature without the least inconvenience. Habit, it is to be confessed, may contribute a good deal to this, but much also is to be ascribed to the compact texture of their skin, which defends them from the impression of cold through their pores.

The northern Indians resemble them in this respect. The utmost rigours of the winter season do not prevent them from following the chase almost naked. It is true, they wear a kind of woollen cloak, or sometimes the skin of a wild beast, upon their shoulders; but besides that it covers only a small part of their body, it would appear that they use it rather for ornament than warmth. In fact, they wear it indiscriminately, in the severities of winter and in the sultriest heats of summer, when neither Europeans nor Negroes can suffer any but the slightest cloathing. They even frequently throw aside this cloak when they go a-hunting, that it may not embarrass them in traversing their forests, where they say the thorns and undergrowth would take hold of it; while, on the contrary, they slide smoothly over the surface of their naked bodies. At all times they go with their heads uncovered, without suffering the least inconvenience, either from the cold, or from those *coups de soleil*, which in Louisiana are so often fatal to the inhabitants of other climates.

The Indians of South America distinguish themselves by modern dresses, in which they affect various tastes. Those of the high country, and of the valleys in Peru, dress partly in the Spanish fashion. Instead of hats they wear bonnets of coarse double cloth, the weight of which neither seems to incommode them when they go to warmer climates, nor does the accidental want of them seem to be felt in situations where the most piercing cold reigns. Their legs and feet are always bare, if we except a sort of sandals made of the skins of oxen. The inhabitants of South America, compared with those of North America, are described as generally more feeble in their frame; less vigorous in the efforts of their mind; of gentler dispositions, more addicted to pleasure, and sunk in indolence.— This, however, is not universally the case. Many of their nations are as intrepid and enterprising as any others on the whole continent. Among the tribes on the banks of the Oroonoko, if a warrior aspires to the post of captain, his probation begins with a long fast, more rigid than any ever observed by the most abstemious hermit. At the close of this the chiefs assemble; and each gives him three lashes with a large whip, applied so vigorously, that his body is almost flayed. If he betrays the least symptom of impatience, or even of sensibility, he is disgraced for ever, and rejected as unworthy of the honour. After some interval, his constancy is proved by a more excruciating trial. He is laid in his hammock with his hands bound fast; and an innumerable multitude of venomous ants,

13
And to the inclemencies of weather.

12
Remarkable insensibility to pain,

14
Terrible trials undergone by their chiefs.

whose

America. whose bite occasions a violent pain and inflammation, are thrown upon him. The judges of his merit stand around the hammock; and whilst these cruel insects fasten upon the most sensible parts of his body, a sigh, a groan, or an involuntary motion expressive of what he suffers, would exclude him from the dignity of which he is ambitious. Even after this evidence, his fortitude is not deemed to be sufficiently ascertained, till he has stood another test more severe, if possible, than the former. He is again suspended in his hammock, and covered with the leaves of the palmetto. A fire of stinking herbs is kindled underneath, so as he may feel its heat, and be involved in smoke. Though scorched and almost suffocated, he must continue to endure this with the same patient insensibility. Many perish in this essay of their firmness and courage; but such as go through it with applause, receive the ensigns of their new dignity with much solemnity, and are ever after regarded as leaders of approved resolution, whose behaviour, in the most trying situations, will do honour to their country. In North America, the previous trial of a warrior is neither so formal nor so severe: Though, even there, before a youth is permitted to bear arms, his patience and fortitude are proved by blows, by fire, and by insults, more intolerable to a haughty spirit than either.

15
Customs
and dis-
positions of
the North
Americans
more parti-
cularly.

Of the manners and customs of the North Americans more particularly, the following is the most consistent account that can be collected from the best informed and most impartial writers.

When the Europeans first arrived in America, they found the Indians quite naked, except those parts which even the most uncultivated people usually conceal. Since that time, however, they generally use a coarse blanket, which they buy of the neighbouring planters.

Their huts or cabins are made of stakes of wood driven into the ground, and covered with branches of trees or reeds. They lie on the floor either on mats or the skins of wild beasts. Their dishes are of timber; but their spoons are made of the skulls of wild oxen, and their knives of flint. A kettle and a large plate constitute almost the whole utensils of the family. Their diet consists chiefly in what they procure by hunting; and sagamite, or pottage, is likewise one of their most common kinds of food. The most honourable furniture amongst them is the scalps of their enemies; with those they ornament their huts, which are esteemed in proportion to the number of this sort of spoils.

16
Their re-
markable
perseverance
and tacit-
urnity.

The character of the Indians is altogether founded upon their circumstances and way of life. A people who are constantly employed in procuring the means of a precarious subsistence, who live by hunting the wild animals, and who are generally engaged in war with their neighbours, cannot be supposed to enjoy much gaiety of temper, or a high flow of spirits. The Indians therefore are in general grave even to sadness; they have nothing of that giddy vivacity peculiar to some nations of Europe, and they despise it. Their behaviour to those about them is regular, modest, and respectful. Ignorant of the arts of amusement, of which that of saying trifles agreeably is one of the most considerable, they never speak but when they have something important to observe; and all their actions,

N^o 14.

words, and even looks, are attended with some meaning. This is extremely natural to men who are almost continually engaged in pursuits, which to them are of the highest importance. Their subsistence depends entirely on what they procure with their hands; and their lives, their honour, and every thing dear to them, may be lost by the smallest inattention to the designs of their enemies. As they have no particular object to attach them to one place rather than another, they fly wherever they expect to find the necessaries of life in greatest abundance. Cities, which are the effects of agriculture and arts, they have none. The different tribes or nations are for the same reason extremely small, when compared with civilized societies, in which industry, arts, agriculture, and commerce, have united a vast number of individuals, whom a complicated luxury renders useful to one another. These small tribes live at an immense distance; they are separated by a desert frontier, and hid in the bosom of impenetrable and almost boundless forests.

There is established in each society a certain species of government, which over the whole continent of America prevails with exceeding little variation; because over the whole of this continent the manners and way of life are nearly similar and uniform. Without arts, riches, or luxury, the great instruments of subjection in polished societies, an American has no method by which he can render himself considerable among his companions, but by superiority in personal qualities of body or mind. But as Nature has not been very lavish in her personal distinctions, where all enjoy the same education, all are pretty much equal, and will desire to remain so. Liberty, therefore, is the prevailing passion of the Americans; and their government, under the influence of this sentiment, is better secured than by the wisest political regulations. They are very far, however, from despising all sort of authority; they are attentive to the voice of wisdom, which experience has conferred on the aged, and they enlist under the banners of the chief in whose valour and military address they have learned to repose their confidence. In every society, therefore, there is to be considered the power of the chief and of the elders; and according as the government inclines more to the one or to the other, it may be regarded as monarchical, or as a species of aristocracy. Among those tribes which are most engaged in war, the power of the chief is naturally predominant; because the idea of having a military leader was the first source of his superiority, and the continual exigencies of the state requiring such a leader, will continue to support, and even to enhance it. His power, however, is rather persuasive than coercive; he is revered as a father, rather than feared as a monarch. He has no guards, no prisons, no officers of justice, and one act of ill-judged violence would pull him from the throne. The elders, in the other form of government, which may be considered as an aristocracy, have no more power. In some tribes, indeed, there are a kind of hereditary nobility, whose influence being constantly augmented by time, is more considerable. (See the article NIAGARA.) But this source of power, which depends chiefly on the imagination, by which we annex to the merit of our contemporaries that of their forefathers, is too refined to be very common among the natives of America. In

America.

17
Form of go-
vernment
among
them.

¹⁸ ^{America.} most countries, therefore, age alone is sufficient for acquiring respect, influence, and authority. It is age which teaches experience, and experience is the only source of knowledge among a barbarous people. Among those persons business is conducted with the utmost simplicity, and which may recall to those who are acquainted with antiquity a picture of the most early ages. The heads of families meet together in a house or cabin appointed for the purpose. Here the business is discussed; and here those of the nation, distinguished for their eloquence or wisdom, have an opportunity of displaying those talents. Their orators, like those of Homer, express themselves in a bold figurative style, stronger than refined, or rather softened nations can well bear, and with gestures equally violent, but often extremely natural and expressive. When the business is over, and they happen to be well provided with food, they appoint a feast upon the occasion, of which almost the whole nation partakes. The feast is accompanied with a song, in which the real or fabulous exploits of their forefathers are celebrated. They have dances too, though, like those of the Greeks and Romans, chiefly of the military kind; and their music and dancing accompany every feast.

¹⁹ ^{Wampum} ^{or belts.} To assist their memory, they have belts of small shells, or beads, of different colours, each representing a particular object, which is marked by their colour and arrangement. At the conclusion of every subject on which they discourse, when they treat with a foreign state, they deliver one of those belts; for if this ceremony should be omitted, all that they have said passes for nothing. Those belts are carefully deposited in each town, as the public records of the nation; and to them they occasionally have recourse, when any public contest happens with a neighbouring tribe. Of late, as the materials of which those belts are made, have become scarce, they often give some skin in place of the wampum (the name of the beads), and receive in return presents of a more valuable return from our commissioners; for they never consider a treaty as of any weight, unless every article in it be ratified by such a gratification.

It often happens, that those different tribes or nations, scattered as they are at an immense distance from one another, meet in their excursions after prey. If there subsists no animosity between them, which seldom is the case, they behave in the most friendly and courteous manner; but if they happen to be in a state of war, or if there has been no previous intercourse between them, all who are not friends are deemed enemies, and they fight with the most savage fury.

²⁰ ^{Their wars.} War, if we except hunting, is the only employment of the men; as to every other concern, and even the little agriculture they enjoy, it is left to the women. Their most common motive for entering into war, when it does not arise from an accidental rencounter or interference, is either to revenge themselves for the death of some lost friends, or to acquire prisoners, who may assist them in their hunting, and whom they adopt into their society. These wars are either undertaken by some private adventurers, or at the instance of the whole community. In the latter case, all the young men who are disposed to go out to battle (for no one is compelled contrary to his inclination), give a bit of wood to the chief, as a token of their design to ac-

company him; for every thing among these people is transacted with a great deal of ceremony and many forms. The chief who is to conduct them fasts several days, during which he converses with no one, and is particularly careful to observe his dreams; which the presumption natural to savages generally renders as favourable as he could desire. A variety of other superstitions and ceremonies are observed. One of the most hideous is setting the war-kettle on the fire, as an emblem that they are going out to devour their enemies; which among some nations must formerly have been the case, since they still continue to express it in clear terms, and use an emblem significant of the ancient usage. Then they dispatch a porcelane, or large shell, to their allies, inviting them to come along, and drink the blood of their enemies. For with the Americans, as with the Greeks of old,

“ A generous friendship no cold medium knows ;
“ But with one love, with one resentment, glows.”

They think that those in their alliance must not only adopt their enmities, but have their resentment wound up to the same pitch with themselves. And indeed no people carry their friendships or their resentment so far as they do; and this is what should be expected from their peculiar circumstances: that principle in human nature which is the spring of the social affections, acts with so much the greater force the more it is restrained. The Americans, who live in small societies, who see few objects and few persons, become wonderfully attached to these objects and persons, and cannot be deprived of them without feeling themselves miserable. Their ideas are too confined to enable them to entertain just sentiments of humanity, or universal benevolence. But this very circumstance, while it makes them cruel and savage to an incredible degree, towards those with whom they are at war, adds a new force to their particular friendships, and to the common tie which unites the members of the same tribe, or of those different tribes which are in alliance with one another. Without attending to this reflection, some facts we are going to relate would excite our wonder without informing our reason, and we would be bewildered in a number of particulars, seemingly opposite to one another, without being sensible of the general cause from which they proceed.

Having finished all the ceremonies previous to the war, and the day appointed for their setting out on the expedition being arrived, they take leave of their friends, and exchange their clothes, or whatever moveables they have, in token of mutual friendship; after which they proceed from the town, their wives and female relations walking before, and attending them to some distance. The warriors march all dressed in their finest apparel and most showy ornaments, without any order. The chief walks slowly before them, singing the war-song, while the rest observe the most profound silence. When they come up to their women, they deliver them all their finery, and putting on their worst clothes, proceed on their expedition.

Every nation has its peculiar ensign or standard, which is generally some beast, bird, or fish. Those among the Five Nations are the bear, otter, wolf, tortoise, and eagle; and by these names the tribes are usually distinguished. They have the figures of those

America.

23
Military
habits.

animals pricked and painted on several parts of their bodies; and when they march through the woods, they commonly, at every encampment, cut the representation of their ensign on trees, especially after a successful campaign: marking at the same time the number of scalps or prisoners they have taken. Their military dress is extremely singular. They cut off or pull out all their hair, except a spot about the breadth of two English crown-pieces, near the top of their heads, and entirely destroy their eye-brows. The lock left upon their heads is divided into several parcels, each of which is stiffened and adorned with wampum, beads, and feathers of various kinds, the whole being twisted into a form much resembling the modern pom-poon. Their heads are painted red down to the eye-brows, and sprinkled over with white down. The gristles of their ears are split almost quite round, and distended with wires or splinters so as to meet and tie together on the nape of the neck. These are also hung with ornaments, and generally bear the representation of some bird or beast. Their noses are likewise bored and hung with trinkets of beads, and their faces painted with various colours so as to make an awful appearance. Their breasts are adorned with a gorget or medal, of brass, copper, or some other metal; and that dreadful weapon the scalping-knife hangs by a string from their neck.

24
Quickness
of their
senses.

The great qualities in an Indian war are vigilance and attention, to give and to avoid a surprise; and indeed in these they are superior to all nations in the world. Accustomed to continual wandering in the forests, having their perceptions sharpened by keen necessity, and living in every respect according to nature, their external senses have a degree of acuteness which at first view appears incredible. They can trace out their enemies at an immense distance by the smoke of their fires, which they smell, and by the tracks of their feet on the ground, imperceptible to an European eye, but which they can count and distinguish with the utmost facility. They can even distinguish the different nations with whom they are acquainted, and can determine the precise time when they passed, where an European could not, with all his glasses, distinguish footsteps at all. These circumstances, however, are of small importance, because their enemies are no less acquainted with them. When they go out, therefore, they take care to avoid making use of any thing by which they might run the danger of a discovery. They light no fire to warm themselves or to prepare their victuals: they lie close to the ground all day, and travel only in the night; and marching along in files, he that closes the rear diligently covers with leaves the tracks of his own feet and of theirs who preceded him. When they halt to refresh themselves, scouts are sent out to reconnoitre the country and beat up every place where they suspect an enemy to lie concealed. In this manner they enter unawares the villages of their foes; and while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men, or make prisoners of as many as they can manage, or have strength enough to be useful to their nation. But when the enemy is apprised of their design, and coming on in arms against them, they throw themselves flat on the ground among the withered herbs and leaves, which their faces are

25
Vigilance
and circum-
spection.

painted to resemble. Then they allow a part to pass unmolested, when all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musket-bullets on their foes. The party attacked returns the same cry. Every one shelters himself with a tree, and returns the fire of the adverse party, as soon as they raise themselves from the ground to give a second fire. Thus does the battle continue until the one party is so much weakened as to be incapable of farther resistance. But if the force on each side continues nearly equal, the fierce spirits of the savages, inflamed by the loss of their friends, can no longer be restrained. They abandon their distant war, they rush upon one another with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies with the bitterest reproaches. A cruel combat ensues, death appears in a thousand hideous forms, which would congeal the blood of civilized nations to behold, but which rouse the fury of savages. They trample, they insult over the dead bodies, tearing the scalp from the head, wallowing in their blood like wild beasts, and sometimes devouring their flesh. The flame rages on till it meets with no resistance; then the prisoners are secured, those unhappy men, whose fate is a thousand times more dreadful than theirs who have died in the field. The conquerors set up a hideous howling to lament the friends they have lost. They approach in a melancholy and severe gloom to their own village; a messenger is sent to announce their arrival, and the women, with frightful shrieks, come out to mourn their dead brothers or their husbands. When they are arrived, the chief relates in a low voice to the elders, a circumstantial account of every particular of the expedition. The orator proclaims aloud this account to the people; and as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The men too join in these cries, according as each is most connected with the deceased by blood or friendship. The last ceremony is the proclamation of the victory; each individual then forgets his private misfortunes, and joins in the triumph of his nation; all tears are wiped from their eyes, and by an unaccountable transition, they pass in a moment from the bitterness of sorrow to an extravagance of joy. But the treatment of the prisoners, whose fate all this time remains undecided, is what chiefly characterises the savages.

We have already mentioned the strength of their affections or resentments. United as they are in small societies, connected within themselves by the firmest ties, their friendly affections, which glow with the most intense warmth within the walls of their own village, seldom extend beyond them. They feel nothing for the enemies of their nation; and their resentment is easily extended from the individual who has injured them to all others of the same tribe. The prisoners, who have themselves the same feelings, know the intentions of their conquerors, and are prepared for them. The person who has taken the captive attends him to the cottage, where, according to the distribution made by the elders, he is to be delivered to supply the loss of a citizen. If those who receive him have their family weakened by war or other accidents, they adopt the captive into the family, of which he becomes a member. But if they have no occasion for him, or their

their resentment for the loss of their friends be too high to endure the sight of any connected with those who were concerned in it, they sentence him to death. All those who have met with the same severe sentence being collected, the whole nation is assembled at the execution, as for some great solemnity. A scaffold is erected, and the prisoners are tied to the stake, where they commence their death-song, and prepare for the ensuing scene of cruelty with the most undaunted courage. Their enemies, on the other side, are determined to put it to the proof, by the most refined and exquisite tortures. They begin at the extremity of his body, and gradually approach the more vital parts. One plucks out his nails by the roots, one by one; another takes a finger into his mouth, and tears off the flesh with his teeth; a third thrusts the finger, mangled as it is, into the bowl of a pipe made red-hot, which he smokes like tobacco; then they pound his toes and fingers to pieces between two stones; they cut circles about his joints, and gashes in the fleshy parts of his limbs, which they fear immediately with red-hot irons, cutting, burning, and pinching them alternately; they pull off this flesh, thus mangled and roasted, bit by bit, devouring it with greediness, and smearing their faces with the blood in an enthusiasm of horror and fury. When they have thus torn off the flesh, they twist the bare nerves and tendons about an iron, tearing and snapping them, whilst others are employed in pulling and extending their limbs in every way that can increase the torment. This continues often five or six hours; and sometimes, such is the strength of the savages, days together. Then they frequently unbind him, to give a breathing to their fury, to think what new torments they shall inflict, and to refresh the strength of the sufferer, who, wearied out with such a variety of unheard-of torments, often falls into so profound a sleep, that they are obliged to apply the fire to awake him, and renew his sufferings. He is again fastened to the stake, and again they renew their cruelty; they stick him all over with small matches of wood that easily takes fire, but burns slowly; they continually run sharp reeds into every part of his body; they drag out his teeth with pincers, and thrust out his eyes; and lastly, after having burned his flesh from the bones with slow fires; after having so mangled the body that it is all but one wound; after having mutilated his face in such a manner as to carry nothing human in it; after having peeled the skin from the head, and poured a heap of red-hot coals or boiling water on the naked skull—they once more unbind the wretch; who, blind, and staggering with pain and weakness, assaulted and pelted upon every side with clubs and stones, now up, now down, falling into their fires at every step, runs hither and thither, until one of the chiefs, whether out of compassion, or weary of cruelty, puts an end to his life with a club or dagger. The body is then put into a kettle, and this barbarous employment is succeeded by a feast as barbarous.

The women, forgetting the human as well as the female nature, and transformed into something worse than furies, even outdo the men in this scene of horror; while the principal persons of the country sit round the stake, smoking and looking on without the least emotion. What is most extraordinary, the sufferer himself, in the little intervals of his torments,

smokes too, appears unconcerned, and converses with his torturers about indifferent matters. Indeed, during the whole time of his execution, there seems a contest which shall exceed, they in inflicting the most horrid pains, or he in enduring them with a firmness and constancy almost above human: not a groan, not a sigh, not a distortion of countenance, escapes him; he possesses his mind entirely in the midst of his torments; he recounts his own exploits; he informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death; and, though his reproaches exasperate them to a perfect madness of rage and fury, he continues his insults even of their ignorance of the art of tormenting, pointing out himself more exquisite methods, and more sensible parts of the body to be afflicted. The women have this part of courage as well as the men; and it is as rare for an Indian to behave otherwise as it would be for any European to suffer as an Indian. Such is the wonderful power of an early institution, and a ferocious thirst of glory. "I am brave and intrepid (exclaims the savage in the face of his tormentors); I do not fear death, nor any kind of tortures; those who fear them are cowards; they are less than women; life is nothing to those that have courage: May my enemies be confounded with despair and rage! Oh! that I could devour them, and drink their blood to the last drop."

But neither the intrepidity on one side, nor the inflexibility on the other, are among themselves matter of astonishment: for vengeance, and fortitude in the midst of torment, are duties which they consider as sacred; they are the effects of their earliest education, and depend upon principles instilled into them from their infancy. On all other occasions they are humane and compassionate. Nothing can exceed the warmth of their affection towards their friends, who consist of all those who live in the same village, or are in alliance with it: among these all things are common; and this, though it may in part arise from their not possessing very distinct notions of separate property, is chiefly to be attributed to the strength of their attachment; because in every thing else, with their lives as well as their fortunes, they are ready to serve their friends. Their houses, their provision, even their young women, are not enough to oblige a guest. Has any one of these succeeded ill in his hunting? Has his harvest failed? or is his house burned? He feels no other effect of his misfortunes, than that it gives him an opportunity to experience the benevolence and regard of his fellow-citizens. On the other hand, to the enemies of his country, or to those who have privately offended, the American is implacable. He conceals his sentiments, he appears reconciled until by some treachery or surprise he has an opportunity of executing an horrible revenge. No length of time is sufficient to allay his resentment; no distance of place great enough to protect the object; he crosses the steepest mountains, he pierces the most impracticable forests, and traverses the most hideous bogs and deserts for several hundreds of miles; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprising his enemy, on whom he exercises the most shocking barbarities, even to the eating of his flesh. To such ex-

31
Treatment
of their
dead
friends.

tremes do the Indians push their friendship or their enmity; and such indeed, in general, is the character of all strong and uncultivated minds.

But what we have said respecting the Indians would be a faint picture, did we omit observing the force of their friendship, which principally appears by the treatment of their dead. When any one of the society is cut off, he is lamented by the whole: on this occasion a thousand ceremonies are practised, denoting the most lively sorrow. No business is transacted, however pressing, till all the pious ceremonies due to the dead are performed. The body is washed, anointed, and painted. Then the women lament the loss with hideous howlings, intermixed with songs which celebrate the great actions of the deceased and his ancestors. The men mourn in a less extravagant manner. The whole village is present at the interment, and the corpse is habited in their most sumptuous ornaments. Close to the body of the defunct are placed his bows and arrows, with whatever he valued most in his life, and a quantity of provision for his subsistence on the journey which he is supposed to take. This solemnity, like every other, is attended with feasting. The funeral being ended, the relations of the deceased confine themselves to their huts for a considerable time to indulge their grief. After an interval of some weeks they visit the grave, repeat their sorrow, new clothe the remains of the body, and act over again all the solemnities of the funeral.

Among the various tokens of their regard for their deceased friends, the most remarkable is what they call the *feast of the dead*, or the *feast of souls*. The day for this ceremony is appointed in the council of their chiefs, who give orders for every thing which may enable them to celebrate it with pomp and magnificence; and the neighbouring nations are invited to partake of the entertainment. At this time, all who have died since the preceding feast of the kind are taken out of their graves. Even those who have been interred at the greatest distance from the villages are diligently sought for, and conducted to this rendezvous of the dead, which exhibits a scene of horror beyond the power of description. When the feast is concluded, the bodies are dressed in the finest skins which can be procured, and after being exposed for some time in this pomp, are again committed to the earth with great solemnity, which is succeeded by funeral games.

32
Supersti-
tions.

Their taste for war, which forms the chief ingredient in their character, gives a strong bias to their religion. Areskoui, or the god of battle, is revered as the great god of the Indians. Him they invoke before they go into the field; and according as his disposition is more or less favourable to them, they conclude they will be more or less successful. Some nations worship the sun and moon; among others there are a number of traditions, relative to the creation of the world and the history of the gods: traditions which resemble the Grecian fables, but which are still more absurd and inconsistent. But religion is not the prevailing character of the Indians; and except when they have some immediate occasion for the assistance of their gods, they pay them no sort of worship. Like all rude nations, however, they are strongly addicted to superstition. They believe in the existence of a number of good and bad genii or spirits, who inter-

fere in the affairs of mortals, and produce all our happiness or misery. It is from the evil genii, in particular, that our diseases proceed; and it is to the good genii we are indebted for a cure. The ministers of the genii are the jugglers, who are also the only physicians among the savages. These jugglers are supposed to be inspired by the good genii, most commonly in their dreams, with the knowledge of future events; they are called in to the assistance of the sick, and are supposed to be informed by the genii whether they will get over the disease, and in what way they must be treated. But these spirits are extremely simple in their system of physic, and, in almost every disease, direct the juggler to the same remedy. The patient is inclosed in a narrow cabin, in the midst of which is a stone red-hot; on this they throw water, until he is well soaked with the warm vapour and his own sweat. Then they hurry him from this bagnio, and plunge him suddenly into the next river. This coarse method, which costs many their lives, often performs very extraordinary cures. The jugglers have likewise the use of some specifics of wonderful efficacy; and all the savages are dexterous in curing wounds by the application of herbs. But the power of these remedies is always attributed to the magical ceremonies with which they are administered.

33
Condition
of their wo-
men.

Though the women generally bear the laborious part of domestic economy, their condition is far from being so slavish as it appears. On the contrary, the greatest respect is paid by the men to the female sex. The women even hold their councils, and have their share in all deliberations which concern the state. Polygamy is practised by some nations, but is not general. In most, they content themselves with one wife; but a divorce is admitted in case of adultery. No nation of the Americans is without a regular marriage, in which there are many ceremonies; the principal of which is, the bride's presenting the bridegroom with a plate of their corn. The women, though before incontinent, are remarkable for chastity after marriage.

34
Their ar-
dent love of
liberty.

Liberty, in its full extent, being the darling passion of the Indians, their education is directed in such a manner as to cherish this disposition to the utmost. Hence children are never upon any account chastised with blows, and they are seldom even reprimanded. Reason, they say, will guide their children when they come to the use of it, and before that time their faults cannot be very great: but blows might damp their free and martial spirit, by the habit of a slavish motive to action. When grown up, they experience nothing like command, dependence, or subordination; even strong persuasion is industriously withheld by those who have influence among them.—No man is held in great esteem, unless he has increased the strength of his country with a captive, or adorned his hut with a scalp of one of his enemies.

35
Crimes and
punish-
ments.

Controversies among the Indians are few, and quickly decided. When any criminal matter is so flagrant as to become a national concern, it is brought under the jurisdiction of the great council; but in ordinary cases, the crime is either revenged or compromised by the parties concerned. If a murder be committed, the family which has lost a relation prepares to retaliate on that of the offender. They often kill the murderer; and when this happens, the kindred of the last person slain

America.

America. slain look upon themselves to be as much injured, and to have the same right to vengeance, as the other party. In general, however, the offender absents himself; the friends send compliments of condolence to those of the person that has been murdered. The head of the family at length appears with a number of presents, the delivery of which he accompanies with a formal speech. The whole ends, as usual, in mutual feastings, songs, and dances. If the murder is committed by one of the same family or cabin, that cabin has the full right of judgment within itself, either to punish the guilty with death, or to pardon him, or to oblige him to give some recompense to the wife or children of the slain. Instances of such a crime, however, very seldom happen; for their attachment to those of the same family is remarkably strong, and is said to produce such friendships as may vie with the most celebrated in fabulous antiquity.

36
Peculiar
manners of
different
nations.

Such, in general, are the manners and customs of the Indian nations; but every tribe has something peculiar to itself. Among the Hurons and Natchez, the dignity of the chief is hereditary, and the right of succession in the female line. When this happens to be extinct, the most respectable matron of the tribe makes choice of whom she pleases to succeed.

The Cherokees are governed by several sachems or chiefs, elected by the different villages; as are also the Creeks and Chactaws. The two latter punish adultery in a woman by cutting off her hair, which they will not suffer to grow till the corn is ripe the next season; but the Illinois, for the same crime, cut off the women's noses and ears.

The Indians on the lakes are formed into a sort of empire; and the emperor is elected from the eldest tribe, which is that of the Ottowawas. He has the greatest authority of any chief that has appeared on the continent since our acquaintance with it. A few years ago, the person who held this rank formed a design of uniting all the Indian nations under his sovereignty; but he miscarried in the attempt.

37
Longevity
of the In-
dians.

In general the American Indians live to a great age, although it is not possible to know from themselves the exact number of their years. It was asked of an Indian, who appeared to be extremely old, what age he was of? I am above twenty, was his reply. Upon putting the question in a different form, by reminding him of certain circumstances in former times, my machu, said he, spoke to me when I was young of the Incas; and he had seen these princes. According to this reply, there must have elapsed, from the date of his machu's (his grandfather's) remembrance to that time, a period of at least 232 years. The man who made this reply appeared to be 120 years of age: for, besides the whiteness of his hair and beard, his body was almost bent to the ground; without, however, showing any other marks of debility or suffering. This happened in 1764. This longevity, attended in general with uninterrupted health, is probably the consequence in part of their vacancy from all serious thought and employment, joined also with the robust texture and conformation of their bodily organs. If the Indians did not destroy one another in their almost perpetual wars, and if their habits of intoxication were not so universal and incurable, they would be, of all the races of men who inhabit the globe, the most likely to prolong, not only

the bounds, but the enjoyments, of animal life to their utmost duration. **America.**

Let us now attend to other pictures which have been given of the aboriginal inhabitants of the New World. The vices and defects of the American Indians have by several writers been most unaccountably aggravated, and every virtue and good quality denied them. Their cruelties have been already described and accounted for. The following anecdote of an Algonquin woman we find adduced as a remarkable proof of their innate thirst of blood. That nation being at war with the Iroquois, she happened to be carried prisoner, and was carried to one of the villages belonging to them. Here she was stripped naked, and her hands and feet bound with ropes in one of their cabins. In this condition she remained ten days, the savages sleeping round her every night. The eleventh night, while they were asleep, she found means to disengage one of her hands, with which she immediately freed herself from the ropes, and went to the door. Though she had now an opportunity of escaping unperceived, her revengeful temper could not let slip so favourable an opportunity of killing one of her enemies. The attempt was manifestly at the hazard of her own life; yet, snatching up a hatchet, she killed the savage that lay next her; and, springing out of the cabin, concealed herself in a hollow tree which she had observed the day before. The groans of the dying person soon alarmed the other savages, and the young ones immediately set out in pursuit of her.—Perceiving from her tree, that they all directed their course one way, and that no savage was near her, she left her sanctuary, and, flying by an opposite direction, ran into a forest without being perceived. The second day after this happened, her footsteps were discovered; and they pursued her with such expedition, that the third day she discovered her enemies at her heels. Upon this she threw herself into a pond of water; and, diving among some weeds and bulrushes, she could just breathe above water without being perceived. Her pursuers, after making the most diligent search, were forced to return.—For 35 days this woman held on her course through woods and deserts, without any other sustenance than roots and wild berries. When she came to the river St. Lawrence, she made with her own hands a kind of a wicker raft, on which she crossed it. As she went by the French for Trois Rivieres, without well knowing where she was, she perceived a canoe full of savages; and fearing they might be Iroquois, ran again into the woods, where she remained till sunset.—Continuing her course soon after, she saw Trois Riviers; and was then discovered by a party whom she knew to be Hurons, a nation in alliance with the Algonquins. She then squatted down behind a bush, calling out to them that she was not in a condition to be seen, because she was naked. They immediately threw her a blanket, and then conducted her to the fort, where she recounted her story.

38
Other pic-
tures of the
Americans.

39
Anecdotes
of an Al-
gonquin
woman.

Personal courage has been denied them. In proof of their pusillanimity, the following incidents are quoted from Charlevoix; by Lord Kames, in his Sketches of the History of Man. "The fort de Vercheres in Canada, belonging to the French, was, in the year 1690,

40
Reproach-
ed with pu-
sillanimity.

America. attacked by some Iroquois. They approached silently, preparing to scale the palafade, when some musket-shot made them retire. Advancing a second time, they were again repulsed, wondering that they could discover none but a woman, who was seen every where. This was Madame de Vercheres, who appeared as resolute as if supported by a numerous garrison. The hopes of storming a place without men to defend it, occasioned reiterated attacks. After two days siege, they retired, fearing to be intercepted in their retreat. Two years after, a party of the same nation appeared before the fort so unexpectedly, that a girl of fourteen, daughter of the proprietor, had but time to shut the gate. With the young woman there was not a soul but one raw soldier. She showed herself with her assistant, sometimes in one place and sometimes in another; changing her dress frequently, in order to give some appearance of a garrison; and always fired opportunely. The faint-hearted Iroquois decamped without success."

There is no instance, it is said, either of a single Indian facing an individual of any other nation in fair and open combat, or of their jointly venturing to try the fate of battle with an equal number of any foes. Even with the greatest superiority of numbers they dare not meet an open attack. Yet notwithstanding this want of courage, they are still formidable; nay, it has been known, that a small party of them has routed a much superior body of regular troops: but this can only happen when they have surpris'd them in the fastnesses of their forests, where the covert of the wood may conceal them until they take their aim with the utmost certainty. After one such discharge they immediately retreat, without leaving the smallest trace of their route. It may easily be supposed, that an onset of this kind must produce confusion even among the steadiest troops, when they can neither know the number of their enemies, nor perceive the place where they lie in ambush.

41
Accused of
perfidy.

Perfidy combined with cruelty has been also made a part of their character. Don Ulloa relates, That the Indians of the country called *Natches*, in Louisiana, laid a plot of massacring in one night every individual belonging to the French colony established there. This plot they actually executed, notwithstanding the seeming good understanding that subsisted between them and these European neighbours. Such was the secrecy which they observed, that no person had the least suspicion of their design until the blow was struck. One Frenchman alone escaped, by favour of the darkness, to relate the disaster of his countrymen. The compassion of a female Indian contributed also in some measure to his exemption from the general massacre. The tribe of *Natches* had invited the Indians of other countries, even to a considerable distance, to join in the same conspiracy. The day, or rather the night, was fixed, on which they were to make an united attack on the French colonists. It was intimated by sending a parcel of rods, more or less numerous according to the local distance of each tribe, with an injunction to abstract one rod daily; the day on which the last fell to be taken away being that fixed for the execution of their plan. The women were partners of the bloody secret. The parcels of rods being thus distributed, that belonging to the tribe of *Natches* happened to remain in the custody of a female. This woman, either moved by her own feelings of compassion, or by

America. the commiseration expressed by her female acquaintances in the view of the proposed scene of bloodshed, abstracted one day three or four of the rods, and thus anticipated the term of her tribe's proceeding to the execution of the general conspiracy. The consequence of this was, that the *Natches* were the only actors in this carnage; their distant associates having still several rods remaining at the time when the former made the attack. An opportunity was thereby given to the colonists in those quarters to take measures for their defence, and for preventing a more extensive execution of the design.

It was by conspiracies similar to this that the Indians of the province of Macas, in the kingdom of Quito, destroyed the opulent city of Logrogno, the colony of Guambaya, and its capital Sevilla del Oro; and that so completely, that it is no longer known in what place these settlements existed, or where that abundance of gold was found from which the last-mentioned city took the addition to its name. Like ravages have been committed upon *l'Imperiale* in Chili, the colonies of the Missions of Chuncas, those of Darien in Terra Firma, and many other places, which have afforded scenes of this barbarous ferocity. These conspiracies are always carried on in the same manner. The secret is inviolably kept, the actors assemble at the precise hour appointed, and every individual is animated with the same sanguinary purposes. The males that fall into their hands are put to death with every shocking circumstance that can be suggested by a cool and determined cruelty. The females are carried off and preserved as monuments of their victory, to be employed as their occasions require.

Nor can this odious cruelty and treachery, it is said, be justly ascribed to their subjection to a foreign yoke, seeing the same character belongs equally to all the original inhabitants of this vast continent, even those who have preserved their independence most completely. Certain it is, continues he, that these people, with the most limited capacities for every thing else, display an astonishing degree of penetration and subtlety with respect to every object that involves treachery, bloodshed, and rapine. As to these, they seem to have been all educated at one school; and a secret, referring to any such plan, no consideration on earth can extort from them.

Their understandings also have been represented as Their un-
not less contemptible than their manners are gross and derstanding
brutal. Many nations are neither capable of forming represented
an arrangement for futurity, nor did their sollicitude as weak.
or foresight extend so far. They set no value upon those things of which they were not in some immediate want. In the evening, when a Carib is going to rest, no consideration will tempt him to sell his hammock; but in the morning he will part with it for the slightest trifle. At the close of winter, a North American, mindful of what he has suffered from the cold, sets himself with vigour to prepare materials for erecting a comfortable hut to protect him against the inclemency of the succeeding season: but as soon as the weather becomes mild, he abandons his work, and never thinks of it more till the return of the cold compels him to resume it.—In short, to be free from labour seems to be the utmost wish of an American. They will continue whole days stretched in their hammocks,

^{America.} mocks, or seated on the earth, without changing their posture, raising their eyes, or uttering a single word. They cannot compute the succession of days nor of weeks. The different aspects of the moon alone engage their attention as a measure of time. Of the year they have no other conception than what is suggested to them by the alternate heat of summer and cold of winter; nor have they the least idea of applying to this period the obvious computation of the months which it contains. When it is asked of any old man in Peru, even the most civilized, what age he is of? the only answer he can give is the number of caciques he has seen. It often happens, too, that they only recollect the most distant of these princes in whose time certain circumstances had happened peculiarly memorable, while of those that lived in a more recent period they have lost all remembrance.

⁴³ Alleged indolence and stupidity.

The same gross stupidity is alleged to be observable in those Indians who have retained their original liberty. They are never known to fix the dates of any events in their minds, or to trace the succession of circumstances that have arisen from such events. Their imagination takes in only the present, and in that only what intimately concerns themselves. Nor can discipline or instruction overcome this natural defect of apprehension. In fact, the subjected Indians in Peru, who have a continual intercourse with the Spaniards, who are furnished with curates perpetually occupied in giving them lessons of religion and morality, and who mix with all ranks of the civilized society established among them, are almost as stupid and barbarous as their countrymen who have had no such advantages. The Peruvians, while they lived under the government of their Incas, preserved the records of certain remarkable events. They had also a kind of regular government, described by the historians of the conquest of Peru. This government originated entirely from the attention and abilities of their princes, and from the regulations enacted by them for directing the conduct of their subjects. This ancient degree of civilization among them gives ground to presume that their legislatures sprung from some race more enlightened than the other tribes of Indians; a race of which no individual seems to remain in the present times.

⁴⁴ Their vanity and conceit.

Vanity and conceit are said to be blended with their ignorance and treachery. Notwithstanding all they suffer from Europeans, they still, it is said, consider themselves as a race of men far superior to their conquerors. This proud belief, arising from their perverted ideas of excellence, is universal over the whole known continent of America. They do not think it possible that any people can be so intelligent as themselves. When they are detected in any of their plots, it is their common observation, that the Spaniards, or *Viracochas*, want to be as knowing as they are. Those of Louisiana and the countries adjacent, are equally vain of their superior understanding, confounding that quality with the cunning which they themselves constantly practise. The whole object of their transactions is to over-reach those with whom they deal. Yet though faithless themselves, they never forgive the breach of promise on the part of others. While the Europeans seek their amity by presents, they give themselves no concern to secure a reciprocal friendship. Hence, probably, arises their idea, that they must be a superior

race of men, in ability and intelligence, to those who are at such pains to court their alliance, and avert their enmity.

Their natural eloquence has also been decried. The free tribes of savages who enter into conventions with the Europeans, it is observed, are accustomed to make long, pompous, and, according to their own notions, sublime harangues, but without any method or connection. The whole is a collection of disjointed metaphors and comparisons. The light, heat, and course of the sun, form the principal topic of their discourse; and these unintelligible reasonings are always accompanied with violent and ridiculous gestures. Numberless repetitions prolong the oration, which, if not interrupted, would last whole days: At the same time, they meditate very accurately before hand, in order to avoid mentioning any thing but what they are desirous to obtain. This pompous faculty of making speeches is also one of the grounds on which they conceive themselves to be superior to the nations of Europe: They imagine that it is their eloquence that procures them the favours they ask. The subjected Indians converse precisely in the same style. Prolix and tedious, they never know when to stop; so that, extending by the difference in language, it would be impossible, in this respect, to distinguish a civilized Peruvian from an inhabitant of the most savage districts to the northward.

But such partial and detached views as the above, were they even free from misrepresentation, are not the just ground upon which to form an estimate of their character. Their qualities, good and bad (for they certainly possess both), their way of life, the state of society among them, with all the circumstances of their condition, ought to be considered in connection, and in regard to their mutual influence. Such a view has been given in the preceding part of this article; from which, it is hoped, their real character may be easily deduced.

Many of the disagreeable traits exhibited in the anecdotes just quoted, are indeed extracted from Don Ulloa: an author of credit and reputation; but a Spaniard, and evidently biased in some degree by a desire to palliate the enormities of his countrymen in that quarter of the globe. And, with regard to the worst and least equivocal parts of the American character, cruelty and revenge; it may be fairly questioned, whether the instances of these, either in respect of their cause or their atrocity, be at all comparable to those exhibited in European history, and staining the annals of Christendom:—to those, for instance, of the Spaniards themselves, at their first discovery of America; to those indicated by the engines found on board their mighty Armada; to those which, in cold blood, were perpetrated by the Dutch at Amboyna; to the dragoonings of the French; to their religious massacres; or even to the *tender mercies* of the Inquisition!

Still harsher, however, are the descriptions given by *Buffon* and *de Paw* of the natives of this whole continent, in which the most mortifying degeneracy of the human race, as well as of all the inferior animals, is asserted to be conspicuous. Against those philosophers, or rather theorists, the Americans have found an able advocate in the *Abbé Clavigero*; an historian, whose

v. II. p. 328.

America. whose situation and long residence in America afforded him the best means of information, and who, though himself a subject of Spain, appears superior to prejudice, and disdains in his description the glosses of policy.

Concerning the stature of the Americans, M. de Paw says, in general, that although it is not equal to the stature of the Castilians, there is but little difference between them. But the Abbé Clavigero evinces, that the Indians who inhabit those countries lying between 9 and 40 degrees of north latitude, which are the limits of the discoveries of the Spaniards, are more than five Parisian feet in height, and that those who do not reach that stature are as few in number amongst the Indians as they are amongst the Spaniards. It is besides certain, that many of those nations, as the *Apaches*, the *Hiaquesse*, the *Pimese*, and *Cochinies*, are at least as tall as the tallest Europeans; and that, in all the vast extent of the New World, no race of people has been found, except the Esquimaux, so diminutive in stature as the Laplanders, the *Samojeds*, and Tartars, in the north of the Old continent. In this respect, therefore, the inhabitants of the two continents are upon an equality.

48
Stature,
shape, &c.

Of the shape and character of the Mexican Indians, the Abbé gives a most advantageous description; which he asserts no one who reads it in America will contradict, unless he views them with the eye of a prejudiced mind. It is true, that Ulloa says, in speaking of the Indians of Quito, he had observed, "that imperfect people abounded among them; that they were either irregularly diminutive, or monstrous in some other respect; that they became either insensible, dumb, or blind; or wanted some limb of their body." Having therefore made some inquiry respecting this singularity of the *Quitans*, the Abbé found, that such defects were neither caused by bad humours, nor by the climate, but by the mistaken and blind humanity of their parents, who, in order to free their children from the hardships and toils to which the healthy Indians are subjected by the Spaniards, fix some deformity or weakness upon them that they may become useless: a circumstance of misery which does not happen in other countries of America, nor in those places of the same kingdom of Quito, where the Indians are under no such oppression. M. de Paw, and, in agreement with him, Dr Robertson, says, that no deformed persons are to be found among the savages of America; because, like the ancient Lacedemonians, they put to death those children which are born hunch-backed, blind, or defective in any limb; but that in those countries where they are formed into societies, and the vigilance of their rulers prevent the murder of such infants, the number of their deformed individuals is greater than it is in any other country of Europe. This would make an exceeding good solution of the difficulty if it were true: but if, possibly, there has been in America a tribe of savages who have imitated the barbarous example of the celebrated Lacedemonians, it is certain that those authors have no grounds to impute such inhumanity to the rest of the Americans; for that it has not been the practice, at least with the far greater part of those nations, is to be demonstrated from the attestations of the authors the best acquainted with their customs.

Nº 14.

No argument against the New World can be drawn from the colour of the Americans: for their colour is less distant from the white of the Europeans than it is from the black of the Africans, and a great part of the Asiatics. The hair of the Mexicans and of the greater part of the Indians is, as we have already said, coarse and thick; on their face they appear to have little, and in general none on their arms and legs: but it is an error to say, as M. de Paw does, that they are entirely destitute of hair in all the other parts of their body. This is one of the many passages of the Philosophical Researches, at which the Mexicans, and all the other nations, must smile to find an European philosopher so eager to divest them of the dress they had from nature. Don Ulloa, indeed, in the description which he gives of the Indians of Quito, says, that hair neither grows upon the men nor upon the women when they arrive at puberty, as it does on the rest of mankind; but whatever singularity may attend the *Quitans*, or occasion this circumstance, there is no doubt that among the Americans in general, the period of puberty is accompanied with the same symptoms as it is among other nations of the world. In fact, with the North Americans, it is disgraceful to be hairy on the body. They say it likens them to hogs. They therefore pluck the hair as fast as it appears. But the traders who marry their women, and prevail on them to discontinue this practice, say, that nature is the same with them as with the whites. As to the beards of the men, had Buffon or de Paw known the pains and trouble it costs them to pluck out by the roots the hair that grows on their faces, they would have seen that nature had not been deficient in that respect. Every nation has its customs. "I have seen an Indian beau, with a looking-glass in his hand (says Mr Jefferson), examining his face for hours together, and plucking out by the roots every hair he could discover, with a kind of tweezer made of a piece of fine brass wire, that had been twisted round a stick, and which he used with great dexterity."

America.
49
Errors concerning their want of beard, &c.

The very aspect of an Angolan, Mandingan, or Congan, would have shocked M. de Paw, and made him recall that censure which he passes on the colour, the make, and hair of the Americans. What can be imagined more contrary to the idea we have of beauty, and the perfection of the human frame, than a man whose body emits a rank smell, whose skin is as black as ink, whose head and face are covered with black wool instead of hair, whose eyes are yellow and bloody, whose lips are thick and blackish, and whose nose is flat? Such are the inhabitants of a very large portion of Africa, and of many islands of Asia. What men can be more imperfect than those who measure no more than four feet in stature, whose faces are long and flat, the nose compressed, the irides yellowish black, the eyelids turned back towards the temples, the cheeks extraordinarily elevated, their mouths monstrously large, their lips thick and prominent, and the lower part of their visages extremely narrow? Such, according to Count de Buffon, are the Laplanders, the Zemblans, the Borandines, the Samojeds, and Tartars in the East. What objects more deformed than men whose faces are too long and wrinkled even in their youth, their noses thick and compressed, their eyes small and sunk, their cheeks very much raised, the upper jaw low, their teeth long

50
Their form and aspect contrasted with those of some other nations.

America. long and disunited, eye-brows so thick that they shade their eyes; the eye-lids thick, some bristles on their faces instead of beard, large thighs and small legs? Such is the picture Count de Buffon gives of the Tartars; that is, of those people who, as he says, inhabit a tract of land in Asia 1200 leagues long and upwards, and more than 750 broad. Amongst these the Calmucks are the most remarkable for their deformity; which is so great, that, according to Tavernier, they are the most brutal men of all the universe. Their faces are so broad that there is a space of five or six inches between their eyes, according as Count de Buffon himself affirms. In Calicut, in Ceylon, and other countries of India, there is, say Pyrrard and other writers on those regions, a race of men who have one or both of their legs as thick as the body of a man; and that this deformity among them is almost hereditary. The Hottentots, besides other gross imperfections, have that monstrous irregularity attending them, of a callous appendage extending from the os pubis downwards, according to the testimony of the historians of the Cape of Good Hope. Struys, Gemelli, and other travellers affirm, that in the kingdom of Lambry, in the islands of Formosa, and of Mindoro, men have been found with tails. Bomare says, that a thing of this kind in men is nothing else than an elongation of the os coccygis; but what is a tail in quadrupeds but the elongation of that bone, though divided into distinct articulations? However it may be, it is certain, that that elongation renders those Asiatics fully as irregular as if it was a real tail.

If we were, in like manner, to go through the nations of Asia and Africa, we should hardly find any extensive country where the colour of men is not darker, where there are not stronger irregularities observed, and grosser defects to be found in them, than M. de Paw finds fault with in the Americans. The colour of the latter is a good deal clearer than that of almost all the Africans and the inhabitants of southern Asia. Even their alleged scantiness of beard is common to the inhabitants of the Philippine Islands, and of all the Indian Archipelago, to the famous Chinese, Japanese, Tartars, and many other nations of the Old continent. The imperfections of the Americans, however great they may be represented to be, are certainly not comparable with the defects of that immense people, whose character we have sketched, and others whom we omit.

51 Their constitution and corporal abilities. M. de Paw represents the Americans to be a feeble and diseased set of nations; and, in order to demonstrate the weakness and disorder of their physical constitution, adduces several proofs equally ridiculous and ill founded, and which it will not be expected we should enumerate. He alleges, among other particulars, that they were overcome in wrestling by all the Europeans, and that they sunk under a moderate burden; that by a computation made, 200,000 Americans were found to have perished in one year from carrying of baggage. With respect to the first point, the Abbé Clavigero observes, it would be necessary that the experiment of wrestling was made between many individuals of each continent, and that the victory should be attested by the Americans as well as the Europeans. It is not, however, meant to insist, that the Americans are stronger than the Europeans. They may be less strong, without the human species having degenerated in them. The Swifs are

America. stronger than the Italians; and still we do not believe the Italians are degenerated, nor do we tax the climate of Italy. The instance of 200,000 Americans having died in one year, under the weight of baggage, were it true, would not convince us so much of the weakness of the Americans, as of the inhumanity of the Europeans. In the same manner that those 200,000 Americans perished, 200,000 Prussians would also have perished, had they been obliged to make a journey of between 300 and 400 miles, with 100 pounds of burden upon their backs; if they had collars of iron about their necks, and were obliged to carry that load over rocks and mountains; if those who became exhausted with fatigue, or wounded their feet so as to impede their progress, had their heads cut off that they might not retard the pace of the rest; and if they were not allowed but a small morsel of bread to enable them to support so severe a toil. Les Casas, from whom M. de Paw got the account of the 200,000 Americans who died under the fatigue of carrying baggage, relates also all the above mentioned circumstances. If that author therefore is to be credited in the last, he is also to be credited in the first. But a philosopher who vaunts the physical and moral qualities of Europeans over those of the Americans, would have done better, we think, to have suppressed facts so opprobrious to the Europeans themselves.

Nothing in fact demonstrates so clearly the robustness of the Americans as those various and lasting fatigues in which they are continually engaged. M. de Paw says, that when the New World was discovered, nothing was to be seen but thick woods; that at present there are some lands cultivated, not by the Americans, however, but by the Africans and Europeans; and that the soil in cultivation is to the soil which is uncultivated as 2000 to 2,000,000. These three assertions the Abbé demonstrates to be precisely as many errors. Since the conquest, the Americans alone have been the people who have supported all the fatigues of agriculture in all the vast countries of the continent of South America, and in the greater part of those of South America subject to the crown of Spain. No European is ever to be seen employed in the labours of the field. The Moors who, in comparison of the Americans, are very few in number in the kingdom of New Spain, are charged with the culture of the sugar-cane and tobacco, and the making of sugar; but the soil destined for the cultivation of those plants is not with respect to all the cultivated land of that country in the proportion of one to two thousand. The Americans are the people who labour on the soil. They are the tillers, the sowers, the weeders, and the reapers of the wheat, of the maize, of the rice, of the beans, and other kinds of grain and pulse, of the cacao, of the vanilla, of the cotton, of the indigo, and all other plants useful to the sustenance, the clothing, and commerce of those provinces; and without them so little can be done, that in the year 1762, the harvest of wheat was abandoned in many places on account of a sickness which prevailed and prevented the Indians from reaping it. But this is not all; the Americans are they who cut and transport all the necessary timber from the woods; who cut, transport, and work the stones; who make lime, plaster, and tiles; who construct all the buildings of that kingdom, except a few places

America.

places where none of them inhabit; who open and repair all the roads, who make the canals and sluices, and clean the cities. They work in many mines of gold, of silver, of copper, &c. they are the shepherds, herdsmen, weavers, potters, basket-makers, bakers, couriers, day-labourers, &c.; in a word, they are the persons who bear all the burden of public labours. These, says our justly indignant author, are the employments of the weak, dastardly, and useless Americans; while the vigorous M. de Paw, and other indefatigable Europeans, are occupied in writing invectives against them.

53
These a sufficient proof of their healthiness & strength.

These labours, in which the Indians are continually employed, certainly attest their healthiness and strength; for if they are able to undergo such fatigues, they cannot be diseased, nor have an exhausted stream of blood in their veins, as M. de Paw insinuates. In order to make it believed that their constitutions are vitiated, he copies whatever he finds written by historians of America, whether true or false, respecting the diseases which reign in some particular countries of that great continent. It is not to be denied, that in some countries in the wide compass of America, men are exposed more than elsewhere to the distempers which are occasioned by the intemperature of the air, or the pernicious quality of the aliments; but it is certain, according to the assertion of many respectable authors acquainted with the New World, that the American countries are, for the most part, healthy; and if the Americans were disposed to retaliate on M. de Paw, and other European authors who write as he does, they would have abundant subject of materials to throw discredit on the clime of the Old continent, and the constitution of its inhabitants in the endemic distempers which prevail there.

Lastly, The supposed feebleness and unsound bodily habit of the Americans do not correspond with the length of their lives. Among those Americans whose great fatigues and excessive toils do not anticipate their death, there are not a few who reach the age of 80, 90, and 100 or more years, as formerly mentioned; and what is more, without there being observed in them that decay which time commonly produces in the hair, in the teeth, in the skin, and in the muscles of the human body. This phenomenon, so much admired by the Spaniards who reside in Mexico, cannot be ascribed to any other cause than the vigour of their constitutions, the temperance of their diet, and the salubrity of their clime. Historians, and other persons who have sojourned there for many years, report the same thing of other countries of the New World.

54
Their mental qualities.

As to the mental qualities of the Americans, M. de Paw has not been able to discover any other characters than a memory so feeble, that to-day they do not remember what they did yesterday; a capacity so blunt, that they are incapable of thinking, or putting their ideas in order; a disposition so cold, that they feel no excitement of love; a dastardly spirit, and a genius that is torpid and indolent. Many other Europeans, indeed, and what is still more wonderful, many of those children or descendants of Europeans who are born in America, think as M. de Paw does; some from ignorance, some from want of reflection, and others from hereditary prejudice and prepossession. But all this and more would not be sufficient to invalidate the testimonies of other Europeans whose authority have a

America.

great deal more weight, both because they were men of great judgment, learning, and knowledge, of these countries, and because they gave their testimony in favour of strangers against their own countrymen. In particular, Acosta, whose natural and moral history even de Paw commends as *an excellent work*, employs the whole sixth book in demonstrating the good sense of the Americans by an explanation of their ancient government, their laws, their histories in paintings and knots, calendars, &c. M. de Paw thinks the Americans are bestial; Acosta, on the other hand, reputes those persons weak and presumptuous who think them so. M. de Paw says, that the most acute Americans were inferior in industry and sagacity to the rudest nations of the Old continent; Acosta extols the civil government of the Mexicans above many republics of Europe. M. de Paw finds, in the moral and political conduct of the Americans, nothing but barbarity, extravagance, and brutality; and Acosta finds there, laws that are admirable and worthy of being preserved for ever.

M. de Paw denies them courage, and alleges the conquest of Mexico as a proof of their cowardice. "Cortes (he says), conquered the empire of Mexico with 450 vagabonds and 15 horses, badly armed; his miserable artillery consisted of six falconets, which would not at the present day be capable of exciting the fears of a fortress defended by invalids. During his absence the capital was held in awe by the half of his troops. What men! what events!—It is confirmed by the depositions of all historians, that the Spaniards entered the first time into Mexico without making one single discharge of their artillery. If the title of hero is applicable to him who has the disgrace to occasion the death of a great number of rational animals, Ferdinand Cortes might pretend to it; otherwise I do not see what true glory he has acquired by the overthrow of a tottering monarchy, which might have been destroyed in the same manner by any other assassin of our continent."

55
M. de Paw's proofs of American cowardice.

These passages indicate either M. de Paw's ignorance of the history of the conquest of Mexico, or a wilful suppression of what would openly contradict his system; since all who have read that history know well, that the conquest of Mexico was not made with 450 men, but with more than 200,000. Cortes himself, to whom it was of more importance than to M. de Paw to make his bravery conspicuous, and his conquest appear glorious, confesses the excessive number of the allies who were under his command at the siege of the capital, and combated with more fury against the Mexicans than the Spaniards themselves. According to the account which Cortes gave to the emperor Charles V. the siege of Mexico began with 87 horses, 848 Spanish infantry, armed with guns, cross-bows, swords, and lances, and upwards of 75,000 allies, of Tlascalala, Huexotzinco, Cholula, and Chalco, equipped with various sorts of arms; with three large pieces of cannon of iron, 15 small of copper, and 13 brigantines. In the course of the siege were assembled the numerous nations of the Otomies, the Coahuixcas, and Matlazincas, and the troops of the populous cities of the lakes; so that the army of the besiegers not only exceeded 200,000, but amounted to 4,000,000, according to the letter from Cortes; and besides these, 3000 boats and canoes came to their assistance. Did it betray cowardice to have sustained,

56
Refuted.

America. stained, for full 75 days, the siege of an open city, engaging daily with an army so large, and in part provided with arms so superior, and at the same time having to withstand the ravages of famine? Can they merit the charge of cowardice, who, after having lost seven of the eight parts of their city, and about 50,000 citizens, part cut off by the sword, part by famine and sickness, continued to defend themselves until they were furiously assaulted in the last hold which was left them? See the article MEXICO.

57
Remark-
able in-
stance of ca-
lumnny in
M. de Paw.

According to M. de Paw, "the Americans at first were not believed to be men, but rather satyrs, or large apes, which might be murdered without remorse or reproach. At last, in order to add insult to the oppression of those times, a pope made an original bull, in which he declared, that being desirous of founding bishoprics in the richest countries of America, it pleased him and the Holy Spirit, to acknowledge the Americans to be true men: in so far, that without this decision of an Italian, the inhabitants of the New World would have appeared, even at this day, to the eyes of the faithful, a race of equivocal men. There is no example of such a decision since this globe has been inhabited by men and apes." Upon this passage the Abbé animadverts, as being a singular instance of calumny and misrepresentation; and gives the following history of the decision alluded to.

58
Occasion of
the famous
bull of Paul
III.

"Some of the first Europeans who established themselves in America, not less powerful than avaricious, desirous of enriching themselves to the detriment of the Americans, kept them continually employed, and made use of them as slaves; and in order to avoid the reproaches which were made them by the bishops and missionaries who inculcated humanity, and the giving liberty to those people to get themselves instructed in religion, that they might do their duties towards the church and their families, alleged, that the Indians were by nature slaves and incapable of being instructed; and many other falsehoods of which the Chronicler Herrera makes mention against them. Those zealous ecclesiastics being unable, either by their authority or preach-

ing, to free those unhappy converts from the tyranny of such misers, had recourse to the Catholic kings, and at last obtained from their justice and clemency, those laws as favourable to the Americans as honourable to the court of Spain, that compose the Indian code, which were chiefly due to the indefatigable zeal of the bishop de las Casas. On another side, Garces, bishop of Tlascala, knowing that those Spaniards bore, notwithstanding their perversity, a great respect to the decisions of the vicar of Jesus Christ, made application in the year 1586 to pope Paul III. by that famous letter, of which we have made mention; representing to him the evils which the Indians suffered from the wicked Christians, and praying him to interpose his authority in their behalf. The pope, moved by such heavy remonstrances, dispatched the next year the original bull, a faithful copy of which we have here subjoined (A), which was not made, as is manifest, to declare the Americans true men; for such a piece of weakness was very distant from that or any other pope: but solely to support the natural rights of the Americans against the attempts of their oppressors, and to condemn the injustice and inhumanity of those, who, under the pretence of supposing those people idolatrous, or incapable of being instructed, took from them their property and their liberty, and treated them as slaves and beasts.

America.

If at first the Americans were esteemed satyrs, nobody can better prove it than Christopher Columbus their discoverer. Let us hear, therefore, how that celebrated admiral speaks, in his account to the Catholic kings Ferdinand and Isabella, of the first satyrs he saw in the island of Haiti, or Hispaniola. "I swear," he says, "to your majesties, that there is not a better people in the world than these, more affectionate, affable, or mild. They love their neighbours as themselves; their language is the sweetest, the softest, and the most cheerful; for they always speak smiling; and although they go naked, let your majesties believe me, their customs are very becoming; and their king, who is served with great majesty, has such engaging manners, that it gives great pleasure to see him, and also to consider

the

(A) Paulus papa III. universis Christi Fidelibus presentes Litteras inspecturis Salutem & Apostolicam Benedictionem—"Veritas ipsa, quæ nec falli, nec fallere potest, cum Prædicatores Fidei ad officium prædicationis destinaret, dixisse dignoscitur: *Euntes docete omnes gentes*: omnes, dixit, absque omni delectu, cum omnes Fidei disciplina capaces existant. Quod videns & invidens ipsius humani generis æmulus, qui bonis operibus, ut peccant, semper adversatur, modum excoegitavit hæcenus inauditum, quo impediret, ne Verbum Dei Gentibus, ut salvæ fierent, prædicaretur: ut quosdam suos satellites commovit, qui suam cupiditatem adimplere cupientes. Occidentales & Meridionales Indos, & alias Gentes, quæ temporibus istis ad nostram notitiam pervenerunt, sub prætextu quod Fidei Catholicæ expertes existant, uti bruta animalia, ad nostra obsequia redigendos esse, passim asserere præsumant, & eos in servitutem redigunt tantis afflictionibus illos urgentes, quantis vix bruta animalia illis servientia urgæant. Nos igitur, qui ejusdem Domini nostri vices, licet indigni, gerimus in terris, & Oves gregis sui nobis commissas, quæ extra ejus Ovile sunt, ad ipsum Ovile toto nixu exquirimus, attendentes Indos ipsos, utpote veros homines, non solum Christianæ Fidei capaces existere, sed, ut nobis innotuit, ad Fidem ipsam promptissime currere, ac volentes super his congruis remediis providere, prædictos Indos & omnes alias gentes ad notitiam Christianorum in posterum deventuras, licet extra fidem Christi existant, sua libertate & dominio hujusmodi uti, & potiri, & gaudere libere, & licete posse, nec in servitutem redigi debere, ac quicquid secus fieri contigerit irritum & inane, ipsosque Indos, & alias Gentes Verbi Dei prædicatione, & exemplo bonæ vitæ ad dictam Fidem Christi invitandos fore. Auctoritate Apostolica per præsentem literas decernimus, & declaramus, non obstantibus premisis, cæterisque contrariis quibuscunque." Datum Romæ anno 1537. IV. Non. Jun. Pontificatus nostri anno III. Quæsta, è non altra è quella famosa bolla, per la quale s'è fatto un sì grande schiamazzo.

America. the great retentive faculty of that people, and their desire of knowledge, which incites them to ask the causes and the effects of things."

60
Conclusions concerning the capacities of the Americans.

"We have had intimate commerce with the Americans (continues the Abbé); have lived for some years in a seminary destined for their instruction; saw the erection and progress of the royal college of Guadalupe founded in Mexico, by a Mexican Jesuit, for the education of Indian children; had afterwards some Indians amongst our pupils; had particular knowledge of many American rectors, many nobles, and numerous artists; attentively observed their character, their genius, their disposition, and manner of thinking; and have examined besides with the utmost diligence their ancient history, their religion, their government, their laws, and their customs. After such long experience and study of them, from which we imagine ourselves enabled to decide without danger of erring, we declare to M. de Paw, and to all Europe, that the mental qualities of the Americans are not in the least inferior to those of the Europeans; that they are capable of all, even the most abstract sciences; and that if equal care was taken of their education, if they were brought up from childhood in seminaries under good masters, were protected and stimulated by rewards, we should see rise among the Americans, philosophers, mathematicians, and divines, who would rival the first in Europe."

61
Their ingenuity, &c. asserted.

But although we should suppose, that, in the torrid climates of the New World, as well as in those of the Old, especially under the additional depression of slavery, there was an inferiority of the mental powers, the Chilese and the North-Americans have discovered higher rudiments of human excellence and ingenuity than have ever been known among tribes in a similar state of society in any part of the world.

M. de Paw affirms, that the Americans were unacquainted with the use of money, and quotes the following well-known passage from Montefquieu: "Imagine to yourself that, by some accident, you are placed in an unknown country; if you find money there, do not doubt that you are arrived among a polished people." But if by money we are to understand a piece of metal with the stamp of the prince or the public, the want of it in a nation is no token of barbarity. The Athenians employed oxen for money, as the Romans did sheep. The Romans had no coined money till the time of Servius Tullius, nor the Persians until the reign of Darius Hystaspes. But if by money is understood a sign representing the value of merchandize, the Mexicans, and other nations of Anahuac, employed money in their commerce. The cacao, of which they made constant use in the market to purchase whatever they wanted, was employed for this purpose, as salt is in Abyssinia.

It has been affirmed, that stone bridges were unknown in America when it was first discovered; and that the natives did not know how to form arches. But these assertions are erroneous. The remains of the ancient palaces of Tezcuco, and still more their vapour baths, show the ancient use of arches and vaults among the Mexicans. But the ignorance of this art would have been no proof of barbarity. Neither the Egyptians nor Babylonians understood the construction of arches.

M. de Paw affirms, that the palace of Montezuma was nothing else than a hut. But it is certain, from

America. the affirmation of all the historians of Mexico, that the army under Cortes, consisting of 6,400 men, were all lodged in the palace; and there remained still sufficient room for Montezuma and his attendants.

62
Tokens of science.

The advances which the Mexicans had made in the study of astronomy is perhaps the most surprising proof of their attention and sagacity: for it appears from Abbé Clavigero's history, that they not only counted 365 days to the year, but also knew of the excess of about six hours in the solar over the civil year, and remedied the difference by means of intercalary days. See ASTRONOMY, n^o 5.

63
Specimen of their morality.

Of American morality, the following exhortation of a Mexican to his son may serve as a specimen. "My son, who art come into the light from the womb of thy mother like a chicken from the egg, and like it art preparing to fly through the world, we know not how long Heaven will grant to us the enjoyment of that precious gem which we possess in thee; but however short the period, endeavour to live exactly, praying God continually to assist thee. He created thee: thou art his property. He is thy father, and loves thee still more than I do; repose in him thy thoughts, and day and night direct thy sighs to him. Reverence and salute thy elders, and hold no one in contempt. To the poor and distressed be not dumb, but rather use words of comfort. Honour all persons, particularly thy parents, to whom thou owest obedience, respect, and service. Guard against imitating the example of those wicked sons, who, like brutes that are deprived of reason, neither reverence their parents, listen to their instruction, nor submit to their correction; because whoever follows their steps will have an unhappy end, will die in a desperate or sudden manner, or will be killed and devoured by wild beasts.

"Mock not, my son, the aged or the imperfect. Scorn not him whom you see fall into some folly or transgression, nor make him reproaches; but restrain thyself, and beware lest thou fall into the same error which offends thee in another. Go not where thou art not called, nor interfere in that which does not concern thee. Endeavour to manifest thy good-breeding in all thy words and actions. In conversation, do not lay thy hands upon another, nor speak too much, nor interrupt or disturb another's discourse. When any one discourses with thee, hear him attentively, and hold thyself in an easy attitude, neither playing with thy feet, nor putting thy mantle to thy mouth, nor spitting too often, nor looking about you here and there, nor rising up frequently if thou art sitting; for such actions are indications of levity and low-breeding."—He proceeds to mention several particular vices which are to be avoided, and concludes—"Steal not, nor give thyself to gaming; otherwise thou wilt be a disgrace to thy parents, whom thou oughtest rather to honour for the education they have given thee. If thou wilt be virtuous, thy example will put the wicked to shame. No more, my son; enough hath been said in discharge of the duties of a father. With these counsels I wish to fortify thy mind. Refuse them not, nor act in contradiction to them; for on them thy life, and all thy happiness, depend."

As ranging on the same side with the Abbé Clavigero, the ingenious Mr Jefferson deserves particular at-

America. attention. This gentleman, in his Notes on the State of Virginia, &c. has taken occasion to combat the opinions of Buffon; and seems to have fully refuted them both by argument and facts. The French philosopher asserts, "That living nature is less active, less energetic, in the New world than in the Old." He affirms, 1. That the animals common to both continents are smaller in America. 2. That those peculiar to the New are on an inferior scale. 3. That those which have been domesticated in both have degenerated in America; and, 4. That it exhibits fewer species of living creatures. The cause of this he ascribes to the diminution of heat in America, and to the prevalence of humidity from the extension of its lakes and waters over a prodigious surface. In other words, he affirms that *heat* is friendly, and *moisture* adverse, to the production and development of the larger quadrupeds.

64 Notions of M. de Buffon concerning the degeneracy of animal nature in America.

65 The hypothesis that moisture is unfriendly to animal growth, Mr Jefferson shows to be contradicted by observation and experience. It is by the assistance of heat and moisture that vegetables are elaborated from the elements. Accordingly we find that the more humid climates produce plants in greater profusion than the dry. Vegetables are immediately or remotely the food of every animal; and, from the uniform operation of nature's laws we discern, that, in proportion to the quantity of food, animals are not only multiplied in their numbers, but improved in their size. Of this last opinion is the Count de Buffon himself in another part of his work: "En general, il paroît que les pays un peu froids conviennent mieux à nos bœufs que les pays chauds, et qu'ils sont d'autant plus gros et plus grands que le climat est plus *humide* et plus abondans en paturages. Les bœufs de Danemarck, de la Podolie, de l'Ukraine, et de la Tartarie qu'habitent les Calmouques, sont les plus grands de tous." Here then a race of animals, and one of the largest too, has been increased in its dimensions by cold and moisture, in direct opposition to the hypothesis, which supposes that these two circumstances diminish animal bulk, and that it is their contraries, heat and dryness, which enlarge it. But to try the question on more general ground, let us take two portions of the earth, Europe and America for instance, sufficiently extensive to give operation to general causes; let us consider the circumstances peculiar to each, and observe their effect on animal nature. America, running through the torrid as well as temperate zone, has more heat, collectively taken, than Europe. But Europe, according to our hypothesis, is the driest. They are equally adapted then to animal productions; each being endowed with one of those causes which befriend animal growth, and with one which opposes it. Let us then take a comparative view of the quadrupeds of Europe and America, presenting them to the eye in three different tables; in one of which shall be enumerated those found in both countries; in a second, those found in one only; in a third, those which have been domesticated in both. To facilitate the comparison, let those of each table be arranged in gradation according to their sizes, from the greatest to the smallest, so far as their sizes can be conjectured. The weights of the large animals shall be expressed in the English avoirdupoise pound and its decimals; those of the smaller in the ounce and its decimals. Those which are marked thus *, are actual weights of particular subjects, deemed among the largest of their species. Those marked thus †, are furnished by judicious persons, well acquainted with the species, and saying, from conjecture only, what the largest individual they had seen would probably have weighed. The other weights are taken from Messrs Buffon and D'Aubenton, and are of such subjects as came casually to their hands for dissection.

66 The contrary maintained by Mr Jefferson.

The hypothesis that moisture is unfriendly to animal growth, considered.

ed thus *, are actual weights of particular subjects, deemed among the largest of their species. Those marked thus †, are furnished by judicious persons, well acquainted with the species, and saying, from conjecture only, what the largest individual they had seen would probably have weighed. The other weights are taken from Messrs Buffon and D'Aubenton, and are of such subjects as came casually to their hands for dissection.

67
Result of the first table.
"The result of this view is, that of 26 quadrupeds common to both countries, seven are said to be larger in America, seven of equal size, and 12 not sufficiently examined. So that the first table impeaches the first member of the assertion, that of the animals common to both countries the American are smallest, "Et cela sans aucune exception." It shows it not just, in all the latitude in which its author has advanced it, and probably not to such a degree as to found a distinction between the two countries.

68
Explanation and result of the second table.
"Proceeding to the second table, which arranges the animals found in one of the two countries only, M. de Buffon observes, that the taphir, the elephant of America, is but of the size of a small cow. To preserve our comparison, Mr Jefferson states the wild boar, the elephant of Europe, as little more than half that size. He has made an elk with round or cylindrical horns, an animal of America, and peculiar to it; because he has seen many of them himself, and more of their horns; and because, from the best information, it is certain that in Virginia this kind of elk has abounded much, and still exists in smaller numbers. He makes the American hare or rabbit peculiar, believing it to be different from both the European animals of those denominations, and calling it therefore by its Algonquin name Whabus, to keep it distinct from these. Kalm is of the same opinion. The squirrels are denominated from a knowledge derived from daily sight of them, because with that the European appellations and descriptions seem irreconcilable. These are the only instances in which Mr Jefferson departs from the authority of M. de Buffon in the construction of this table; whom he takes for his ground-work, because he thinks him the best informed of any naturalist who has ever written. The result is, that there are 18 quadrupeds peculiar to Europe; more than four times as many, to wit 74, peculiar to America; that the first of these 74, the tapir, the largest of the animals peculiar to America, weighs more than the whole column of Europeans; and consequently this second table disproves the second member of the assertion, that the animals peculiar to the New World are on a smaller scale, so far as that assertion relied on European animals for support: and it is in full opposition to the theory which makes the animal volume to depend on the circumstances of heat and moisture.

69
Of the third table.
"The third table comprehends those quadrupeds only which are domestic in both countries. That some of these, in some parts of America, have become less than their original stock, is doubtless true; and the reason is very obvious. In a thinly-peopled country, the

America. the spontaneous productions of the forests and waste fields are sufficient to support indifferently the domestic animals of the farmer, with a very little aid from him in the severest and scarcest season. He therefore finds it more convenient to receive them from the hand of nature in that indifferent state, than to keep up their size by a care and nourishment which would cost him much labour. If, on this low fare, these animals dwindle, it is no more than they do in those parts of Europe where the poverty of the soil, or poverty of the owner, reduces them to the same scanty subsistence. It is the uniform effect of one and the same cause, whether acting on this or that side of the globe. It would be erring therefore against that rule of philosophy, which teaches us to ascribe like effects to like causes, should we impute this diminution of size in America to any imbecillity or want of uniformity in the operations of nature. It may be affirmed with truth, that in those countries, and with those individuals of America, where necessity or curiosity has produced equal attention as in Europe to the nourishment of animals, the horses, cattle, sheep, and hogs of the one continent are as large as those of the other. There are particular instances, well attested, where individuals of America have imported good breeders from England, and have improved their size by care in the course of some years. And the weights actually known and stated in the third table, will suffice to show, that we may conclude, on probable grounds, that, with equal food and care, the climate of America will preserve the races of domestic animals as large as the European stock from which they are derived; and consequently that the third member of *Monf. de Buffon's* assertion, that the domestic animals are subject to degeneration from the climate of America, is as probably wrong as the first and second were certainly so.

That the last part of it is erroneous, which affirms, that the species of American quadrupeds are comparatively few, is evident from the tables taken altogether; to which may be added the proof adduced by the *Abbé Clavigero*. According to *Buffon's* latest calculation, in his *Epoques de la Nature*, there are 300 species of quadrupeds; and America, though it does not make more than a third part of the globe, contains, according to *Clavigero*, almost one half of the different species of its animals.

70 The human inhabitants comprehended in the same hypothesis of degeneracy. Of the human inhabitants of America, to whom the same hypothesis of degeneracy is extended, *M. Buffon* gives the following description: "Though the American savage be nearly of the same stature with men in polished societies; yet this is not a sufficient exception to the general contraction of animated Nature throughout the whole continent. In the savage, the organs of generation are small and feeble. He has no hair, no beard, no ardour for the female. Though nimbler than the European, because more accustomed to running, his strength is not so great. His sensations are less acute; and yet he is more timid and cowardly. He has no vivacity, no activity of mind. The activity of his body is not so much an exercise or spontaneous motion, as a necessary action produced by want. Destroy his appetite for victuals and drink, and you will at once annihilate the active principle of all his movements: He remains in stupid repose, on his limbs or couch, for whole days. It is easy to discover the cause of the

scattered life of savages, and of their estrangement from society. They have been refused the most precious spark of Nature's fire: They have no ardour for women, and, of course, no love to mankind. Unacquainted with the most lively and most tender of all attachments, their other sensations of this nature are cold and languid. Their love to parents and children is extremely weak. The bonds of the most intimate of all societies, that of the same family, are feeble; and one family has no attachment to another. Hence no union, no republic, no social state, can take place among them. The physical cause of love gives rise to the morality of their manners. Their heart is frozen, their society cold, and their empire cruel. They regard their females as servants destined to labour, or as beasts of burden, whom they load unmercifully with the produce of their hunting, and oblige, without pity or gratitude, to perform labours which often exceed their strength. They have few children, and pay little attention to them. Every thing must be referred to the first cause: They are indifferent, because they are weak; and this indifference to the sex is the original stain which disgraces Nature, prevents her from expanding, and, by destroying the germs of life, cuts the root of society. Hence man makes no exception to what has been advanced. Nature, by denying him the faculty of love, has abused and contracted him more than any other animal."

A humiliating picture, indeed! but than which, *Mr Jefferson* assures us, never was one more unlike the original. *M. Buffon* grants, that their stature is the same as that of the men of Europe, and he might have admitted, that the *Iroquois* were larger, and the *Lenopi* or *Delawares* taller, than people in Europe generally are: But he says their organs of generation are smaller and weaker than those of Europeans: which is not a fact. And as to their want of beard, this error has been already noticed (*n° 49. supra*).

72 "They have no ardour for their female."— It is seeming true, they do not indulge those excesses, nor discover coldness of the Americans to the sex accounted for. that fondness, which are customary in Europe; but this is not owing to a defect in nature, but to manners. Their soul is wholly bent upon war. This is what procures them glory among the men, and makes them the admiration of the women. To this they are educated from their earliest youth. When they pursue game with ardour, when they bear the fatigues of the chase, when they sustain and suffer patiently hunger and cold; it is not so much for the sake of the game they pursue, as to convince their parents and the council of the nation, that they are fit to be enrolled in the number of the warriors. The songs of the women, the dance of the warriors, the sage counsel of the chiefs, the tales of the old, the triumphal entry of the warriors returning with success from battle, and the respect paid to those who distinguish themselves in battle, and in subduing their enemies; in short, every thing they see or hear, tends to inspire them with an ardent desire for military fame. If a young man were to discover a fondness for women before he has been to war, he would become the contempt of the men, and the scorn and ridicule of the women: or were he to indulge himself with a captive taken in war, and much more were he to offer violence in order to gratify his lust, he would incur indelible disgrace. The seeming frigid-
dity

America. dity of the men, therefore, is the effect of manners, and not a defect of nature. They are neither more defective in ardour, nor more impotent with the female, than are the whites reduced to the same diet and exercise.

73
Why they
have few
children.

“They raise few children.”—They indeed raise fewer children than we do; the causes of which are to be found, not in a difference of nature, but of circumstance. The women very frequently attending the men in their parties of war and of hunting, childbearing becomes extremely inconvenient to them. It is said, therefore, that they have learned the practice of procuring abortion by the use of some vegetable; and that it even extends to prevent conception for a considerable time after. During these parties they are exposed to numerous hazards, to excessive exertions, to the greatest extremities of hunger. Even at their homes, the nation depends for food, through a certain part of every year, on the gleanings of the forest; that is, they experience a famine once in every year. With all animals, if the female be badly fed, or not fed at all, her young perish; and if both male and female be reduced to like want, generation becomes less active, less productive. To the obstacles, then, of want and hazard, which nature has opposed to the multiplication of wild animals, for the purpose of restraining their numbers within certain bounds, those of labour and of voluntary abortion are added with the Indian. No wonder, then, if they multiply less than we do. Where food is regularly supplied, a single farm will show more of cattle than a whole country of forests can of buffaloes. The same Indian women, when married to white traders, who feed them and their children plentifully and regularly, who exempt them from excessive drudgery, who keep them stationary and unexposed to accident, produce and raise as many children as the white women. Instances are known, under these circumstances, of their rearing a dozen children.

74
Of their
sensibility,
&c.

Neither do they seem to be “deficient in natural affection.” On the contrary, their sensibility is keen, even the warriors weeping most bitterly on the loss of their children; though in general they endeavour to appear superior to human events.

Their friendships are strong, and faithful to the uttermost extremity. A remarkable instance of this appeared in the case of the late Col. Byrd, who was sent to the Cherokee nation to transact some business with them. It happened that some of our disorderly people had just killed one or two of that nation. It was therefore proposed in the council of the Cherokees, that Col. Byrd should be put to death in revenge for the loss of their countrymen. Among them was a chief called *Silduce*, who, on some former occasion, had contracted an acquaintance and friendship with Col. Byrd. He came to him every night in his tent, and told him not to be afraid, they should not kill him. After many days deliberation, however, the determination was, contrary to *Silduce*'s expectation, that Byrd should be put to death, and some warriors were dispatched as executioners. *Silduce* attended them; and when they entered the tent, he threw himself between them and Byrd, and said to the warriors, “This man is my friend: before you get at him, you must kill me.” On which they returned; and the council

N^o 14.

respected the principle so much as to recede from their determination. *America.*

That “they are timorous and cowardly” is a character with which there is little reason to charge them, when we recollect the manner in which the Iroquois met *Monf.* ———, who marched into their country; in which the old men, who scorned to fly, or to survive the capture of their town, braved death like the old Romans in the time of the Gauls, and in which they soon after revenged themselves by sacking and destroying *Montreal*. In short, the Indian is brave, when an enterprise depends on bravery; education with him making the point of honour consist in the destruction of an enemy by stratagem, and in the preservation of his own person free from injury: or perhaps this is nature, while it is education which teaches us to honour force more than finess. He will defend himself against an host of enemies, always choosing to be killed rather than to surrender, though it be to the whites, who he knows will treat him well. In other situations, also, he meets death with more deliberation; and endures tortures with a firmness unknown almost to religious enthusiasm among us.

75
Of their
courage.
(See also
n^o 54, 55,
supra.)

Much less are they to be characterized as a people of no vivacity, and who are excited to action or motion only by the calls of hunger and thirst. Their dances, in which they so much delight, and which to a European would be the most severe exercise, fully contradict this; not to mention their fatiguing marches, and the toil they voluntarily and cheerfully undergo in their military expeditions. It is true, that when at home they do not employ themselves in labour or the culture of the soil: but this, again, is the effect of customs and manners which have assigned that to the province of the women. But it is said, “they are averse to society and a social life.” Can any thing be more inapplicable than this to a people who always live in towns or in clans? Or can they be said to have no *republique*, who conduct all their affairs in national councils; who pride themselves in their national character; who consider an insult or injury done to an individual by a stranger as done to the whole, and resent it accordingly?

To form a just estimate of their genius and mental powers, Mr *Jefferson* observes, more facts are wanting, and great allowance is to be made for those circumstances of their situation which call for a display of particular talents only. This done, we shall probably find that the Americans are formed, in mind as well as in body, on the same model with the *homo sapiens Europæus*. The principles of their society forbidding all compulsion, they are to be led to duty and to enterprise by personal influence and persuasion. Hence eloquence in council, bravery and address in war, become the foundations of all consequence with them. To these acquirements all their faculties are directed. Of their bravery and address in war we have multiplied proofs, because we have been the subjects on which they were exercised. Of their eminence in oratory we have fewer examples, because it is displayed chiefly in their own councils. Some, however, we have of very superior lustre. We may challenge the whole orations of *Demosthenes* and *Cicero*, and of any more eminent orator, if Europe has furnished more eminent, to produce a single passage superior to the speech

Logan, a Mingo chief, to Lord Dunmore when
 or of this state. The story is as follows; of which,
 of the speech, the authenticity is unquestionable.
 In the spring of the year 1774, a robbery and murder
 committed on an inhabitant of the frontiers of
 Virginia by two Indians of the Shawanee tribe. The
 neighbouring whites, according to their custom, under-
 took to punish this outrage in a summary way. Colo-
 nel Cresap, a man infamous for the many murders he
 had committed on those much-injured people, collect-
 ed a party, and proceeded down the Kanlaway in
 quest of vengeance. Unfortunately a canoe of women
 and children, with one man only, was seen coming
 from the opposite shore, unarmed, and unsuspecting
 any hostile attack from the whites. Cresap and his
 party concealed themselves on the bank of the river;
 and the moment the canoe reached the shore, singled
 out their objects, and at one fire killed every person in
 it. This happened to be the family of Logan, who
 had long been distinguished as a friend of the whites.
 This unworthy return provoked his vengeance. He ac-
 cordingly signalized himself in the war which ensued.
 In the autumn of the same year a decisive battle was
 fought at the mouth of the Great Kanlaway, between
 the collected forces of the Shawanees, Mingoes, and
 Delawares, and a detachment of the Virginia militia.
 The Indians were defeated, and sued for peace. Logan,
 however, disdained to be seen among the suppliants;
 but, lest the sincerity of a treaty should be distrust-
 ed from which so distinguished a chief absented himself,
 he sent by a messenger the following speech, to be de-
 livered to Lord Dunmore:—"I appeal to any white
 man to say if ever he entered Logan's cabin hungry,
 and he gave him not meat; if ever he came cold and
 naked, and he clothed him not. During the course
 of the last long and bloody war, Logan remained idle
 in his cabin, an advocate for peace. Such was my
 love for the whites, that my countrymen pointed as
 they passed, and said, *Logan is the friend of white men*.
 I had even thought to have lived with you, but for
 the injuries of one man. Colonel Cresap, the last
 spring, in cold blood, and unprovoked, murdered all
 the relations of Logan, not sparing even my women
 and children. There runs not a drop of my blood in
 the veins of any living creature. This called on me
 for revenge. I have sought it; I have killed many;
 I have fully glutted my vengeance. For my country,
 I rejoice at the beams of peace; but do not harbour a
 thought that mine is the joy of fear. Logan never
 felt fear. He will not turn on his heel to save his life.
 Who is there to mourn for Logan? Not one."

77
 Specimen
 of Indian
 eloquence

78
 Other anec-
 dotes.

To the preceding anecdotes in favour of the Ameri-
 can character, may be added the following by Dr Ben-
 jamin Franklin.—The Indian men, when young, are
 hunters and warriors: when old, counsellors; for all
 their government is by the counsel or advice of the
 sages. Hence they generally study oratory; the best
 speaker having the most influence. The Indian wo-
 men till the ground, dress the food, nurse and bring
 up the children, and preserve and hand down to poste-
 rity the memory of public transactions. These employ-
 ments of men and women are accounted natural and ho-
 nourable. Having few artificial wants, they have abun-
 dant leisure for improvement by conversation. Our
 laborious manner of life, compared with theirs, they e-

VOL. I. Part II.

steem slavish and base; and the learning on which we
 value ourselves, they regard as frivolous and useless.

Having frequent occasions to hold public councils,
 they have acquired great order and decency in conduct-
 ing them. The old men sit in the foremost ranks, the
 warriors in the next, and the women and children in
 the hindmost. The business of the women is to take
 exact notice of what passes; imprint it in their memo-
 ries, for they have no writing, and communicate it to
 their children. They are the records of the council,
 and they preserve tradition of the stipulations in trea-
 ties a hundred years back; which, when we compare
 with our writings, we always find exact. He that
 would speak rises. The rest observe a profound silence.
 When he has finished, and sits down, they leave him
 five or six minutes to recollect, that if he has omitted
 any thing he intended to say, or has any thing to add,
 he may rise again and deliver it. To interrupt ano-
 ther, even in common conversation, is reckoned highly
 indecent.

The politeness of these savages in conversation is,
 indeed, carried to excess; since it does not permit
 them to contract or deny the truth of what is asserted
 in their presence. By this means they indeed avoid
 disputes; but then it becomes difficult to know their
 minds, or what impression you make upon them. The
 missionaries who have attempted to convert them to
 Christianity, all complain of this as one of the great
 difficulties of their mission. The Indians hear with pa-
 tience the truths of the gospel explained to them, and
 give their usual tokens of assent and approbation; but
 this by no means implies conviction; it is mere civility.

79
 Politeness
 and civility
 of the Ame-
 rican In-
 dians.

When any of them come into our towns, our people
 are apt to crowd round them, gaze upon them, and in-
 commodate them where they desire to be private; this
 they esteem great rudeness, and the effect of the want
 of instruction in the rules of civility and good manners.
 "We have," say they, "as much curiosity as you;
 and when you come into our towns, we wish for op-
 portunities of looking at you; but for this purpose we
 hide ourselves behind bushes where you are to pass, and
 never intrude ourselves into your company."

Their manner of entering one another's villages has
 likewise its rules. It is reckoned uncivil in travelling
 strangers to enter a village abruptly, without giving
 notice of their approach. Therefore, as soon as they
 arrive within hearing, they stop and hollow, remaining
 there till invited to enter. Two old men usually come
 out to them and lead them in. There is in every vil-
 lage a vacant dwelling, called the *strangers house*. Here
 they are placed, while the old men go round from hut
 to hut, acquainting the inhabitants that strangers are
 arrived, who are probably hungry and weary; and
 every one sends them what he can spare of victuals, and
 skins to repose on. When the strangers are refreshed,
 pipes and tobacco are brought; and then, but not be-
 fore, conversation begins, with inquiries who they are,
 whither bound, what news, &c. and it usually ends with
 offers of service: if the strangers have occasion for
 guides, or any necessaries for continuing their journey;
 and nothing is exacted for the entertainment.

80
 Their ho-
 spitality.

The same hospitality, esteemed among them as a
 principal virtue, is practised by private persons; of
 which Conrad Weiser, our interpreter, gave Dr Frank-
 lin the following instance: He had been naturalized

4 B

among

America. among the Six Nations, and spoke well the Mohock language. In going through the Indian country to carry a message from our governor to the council at Onondaga, he called at the habitation of Canassetego, an old acquaintance, who embraced him, spread furs for him to sit on, placed before him some boiled beans and venison, and mixed some rum and water for his drink. When he was well refreshed, and had lit his pipe, Canassetego began to converse with him: asked how he had fared the many years since they had seen each other, whence he then came, what had occasioned the journey, &c. Conrad answered all his questions; and when the discourse began to flag, the Indian, to continue it, said, "Conrad, you have lived long among the white people, and know something of their customs; I have been sometimes at Albany, and have observed, that once in seven days they shut up their shops, and assemble all in the great house; tell me what it is for?—What do they do there?" "They meet there," says Conrad, "to hear and learn *good things*." "I do not doubt," says the Indian, "that they tell you so; they have told me the same: but I doubt the truth of what they say, and I will tell you my reasons. I went lately to Albany to sell my skins, and buy blankets, knives, powder, rum, &c. You know I generally used to deal with Hans Hanson; but I was a little inclined this time to try some other merchants. However, I called first upon Hans, and asked him what he would give for beaver. He said he could not give more than 4s. a pound; but (says he) I cannot talk on business now; this is the day when we meet together to learn *good things*, and I am going to the meeting. So I thought to myself, since I cannot do any business to-day, I may as well go to the meeting too; and I went with him.—There stood up a man in black, and began to talk to the people very angrily. I did not understand what he said; but perceiving that he looked much at me and at Hanson, I imagined he was angry at seeing me there: so I went out, sat down near the house, struck fire, and lit my pipe, waiting till the meeting should break up. I thought too, that the man had mentioned something of beaver, and I suspected that it might be the subject of their meeting. So when they came out, I accosted my merchant.—Well, Hans, (says I,) I hope you have agreed to give more than 4s. a pound?" "No, (says he), I cannot give so much, I cannot give more than 3s. 6d." "I then spoke to several other dealers, but they all sung the same song, three and sixpence, three and sixpence. This made it clear to me that my suspicion was right; and that whatever they pretended of meeting to learn *good things*, the real purpose was, to consult how to cheat Indians in the price of beaver. Consider but a little, Conrad, and you must be of my opinion. If they met so often to learn *good things*, they certainly would have learned some before this time. But they are still ignorant. You know our practice. If a white man, in travelling through our country, enters one of our cabins, we all treat him as I treat you; we dry him if he is wet, we warm him if he is cold, and give him meat and drink, that he may allay his thirst and hunger; and we spread soft furs for him to rest and sleep on: we demand nothing in return. But if I go into a white man's house at Albany, and ask for victuals and drink, they say, Where is your money? And if I have none, they say, Get out, you Indian dog. You see they have not yet learned

America. those little *good things* that we need no meeting to be instructed in; because our mothers taught them to us when we were children; and therefore it is impossible there meetings should be, as they say, for any such purpose, or have any such effect; they are only to contrive the cheating of Indians in the price of beaver."

The next question that occurs is, Whether the peculiarities of the Americans, or the disparity between them and the inhabitants of Europe, afford sufficient grounds for determining them, as some have done, to be a race of men radically different from all others?

In this question, to avoid being tedious, we shall confine ourselves to what has been advanced by Lord Kames; who is of opinion, that there are many different species of men, as well as of other animals; and gives an hypothesis, whereby he pretends his opinion may be maintained in a consistency with Revelation. 8r
"If (says he) the only rule afforded by nature for classing animals can be depended on, there are different Lord Kames's arguments for different species. races of men as well as of dogs: a mastiff differs not more from a spaniel, than a white man from a negro, or a Laplander from a Dane. And, if we have any faith in Providence, it ought to be so. Plants were created of different kinds, to fit them for different climates; and so were brute animals. Certain it is, that all men are not fitted equally for every climate. There is scarce a climate but what is natural to some men, where they prosper and flourish; and there is not a climate but where some men degenerate. Doth not then analogy lead us to conclude, that, as there are different climates on the face of this globe, so there are different races of men fitted for these different climates?"

"M. Buffon, from the rule, That animals which can procreate together, and whose progeny can also procreate, are of one species; concludes, that all men are of one race or species; and endeavours to support that favourite opinion, by ascribing to the climate, to food, or to other accidental causes, all the varieties that are found among men. But is he seriously of opinion, that any operation of climate, or of other accidental cause, can account for the copper colour and smooth chin universal among the Americans; the prominence of the pudenda universal among the Hottentot women, or the black nipple no less universal among the female Samoiedes?—It is in vain to ascribe to the climate, the low stature of the Esquimaux, the smallness of their feet, or the overgrown size of their heads. It is equally in vain to ascribe to climate the low stature of the Laplanders, or their ugly visage. The black colour of negroes, thick lips, flat nose, crisped woolly hair, and rank smell, distinguish them from every other race of men. The Abyssinians, on the contrary, are tall and well made, their complexion a brown olive, features well-proportioned, eyes large and of a sparkling black, thin lips, a nose rather high than flat. There is no such difference of climate between Abyssinia and Negro-land as to produce these striking differences.

"Nor shall our author's ingenious hypothesis concerning the extremities of heat and cold, purchase him impunity with respect to the fallow complexion of the Samoiedes, Laplanders, and Greenlanders. The Finlanders, and northern Norwegians, live in a climate not less cold than that of the people mentioned; and yet are fair beyond other Europeans. I say more, there are many instances of races of people preserving their

America. their original colour, in climates very different from their own; but not a single instance of the contrary, as far as I can learn. There have been four complete generations of negroes in Pennsylvania, without any visible change of colour; they continue jet black, as originally. Those who ascribe all to the sun, ought to consider how little probable it is, that the colour it impresses on the parents should be communicated to their infant children, who never saw the sun: I should be as soon induced to believe with a German naturalist, whose name has escaped me, that the negro colour is owing to an ancient custom in Africa, of dyeing the skin black. Let a European, for years, expose himself to the sun in a hot climate, till he be quite brown; his children will nevertheless have the same complexion with those in Europe. From the action of the sun, is it possible to explain, why a negro, like a European, is born with a ruddy skin, which turns jet black the eighth or ninth day?"

Our author next proceeds to draw some arguments for the existence of different races of men, from the various tempers and dispositions of different nations; which he reckons to be *specific* differences, as well as those of colour, stature, &c. and having summed up his evidence, he concludes thus: "Upon summing up the whole particulars mentioned above, would one hesitate a moment to adopt the following opinion, were there no counterbalancing evidence, viz. 'That God created many pairs of the human race, differing from each other, both externally and internally; that he fitted those pairs for different climates, and placed each pair in its proper climate; that the peculiarities of the original pairs were preserved entire in their descendants; who, having no assistance but their natural talents, were left to gather knowledge from experience; and, in particular, were left (each tribe) to form a language for itself; that signs were sufficient for the original pairs, without any language but what nature suggests; and that a language was formed gradually, as a tribe increased in numbers, and in different occupations, to make speech necessary?" But this opinion, however plausible, we are not permitted to adopt; being taught a different lesson by Revelation, viz. That God created but a single pair of the human species. Though we cannot doubt the authority of Moses, yet his account of the creation of man is not a little puzzling, as it seems to contradict every one of the facts mentioned above. According to that account, different races of men were not formed, nor were men formed originally for different climates. All men must have spoken the same language, viz. That of our first parents. And what of all seems the most contradictory to that account, is the savage state: Adam, as Moses informs us, was endued by his Maker with an eminent degree of knowledge; and he certainly was an excellent preceptor to his children and their progeny, among whom he lived many generations. Whence then the degeneracy of all men unto the savage state? To account for that dismal catastrophe, mankind must have suffered some terrible convulsion. That terrible convulsion is revealed to us in the history of the tower of Babel, contained in the 11th chapter of Genesis, which is, 'That, for many centuries after the deluge, the whole earth was of one language, and of one speech; that they united to

82
His hypothesis concerning the origin of the different species.

' build a city on a plain in the land of Shinar, with a tower, whose top might reach unto heaven; that the Lord, beholding the people to be one, and to have all one language, and that nothing would be restrained from them which they imagined to do, confounded their language that they might not understand one another, and scattered them abroad upon the face of all the earth.' Here light breaks forth in the midst of darkness. By confounding the language of men, and scattering them abroad upon the face of all the earth, they were rendered savages. And to harden them for their new habitations, it was necessary that they should be divided into different kinds, fitted for different climates. Without an immediate change of constitution, the builders of Babel could not possibly have subsisted in the burning region of Guinea, nor in the frozen region of Lapland; houses not being prepared, nor any other convenience to protect them against a destructive climate."

America.

We may first remark, on his Lordship's hypothesis, that it is evidently incomplete: for, allowing the human race to have been divided into different species at the confusion of languages, and that each species was adapted to a particular climate; by what means were they to get to the climates proper for them, or how were they to know that such climates existed? How was an American, for instance, when languishing in an improper climate at Babel, to get to the land of the Amazons, or the banks of the Oroonoko, in his own country? or how was he to know that these places were more proper for him than others?—If, indeed, we take the scripture phrase, "The Lord scattered them abroad upon the face of all the earth," in a certain sense, we may account for it. If we suppose that the different species were immediately carried off by a whirlwind, or other supernatural means, to their proper countries, the difficulty will vanish: but if this is his Lordship's interpretation, it is certainly a very singular one.

83
Incomplete.

Before entering upon a consideration of the particular arguments used by our author for proving the diversity of species in the human race, it will be proper to lay down the following general principles, which may serve as axioms. (1.) When we assert a multiplicity of species in the human race; we bring in a supernatural cause to solve a natural phenomenon: for these species are supposed to be the immediate work of the Deity. (2.) No person has a right to call any thing the immediate effect of omnipotence, unless by express revelation from the Deity, or from a certainty that no natural cause is sufficient to produce the effect. The reason is plain. The Deity is invisible, and so are many natural causes: when we see an effect therefore, of which the cause does not manifest itself, we cannot know whether the immediate cause is the Deity, or an invisible natural power. An example of this we have in the phenomena of thunder and earthquakes, which were often ascribed immediately to the Deity, but are now discovered to be the effects of electricity. (3.) No person can assert natural causes to be sufficient to produce such and such effects, unless he perfectly knows all these causes, and the limits of their power in all possible cases; and this no man has ever known, or can know.

84
General principles to be kept in view in reasoning on this subject.

By keeping in view these principles, which we hope are self-evident, we will easily see Lord Kames's arguments

America. Arguments to consist entirely in a *petitio principii*.—In substance they are all reduced to this single sentence: "Natural philosphers have been hitherto unsuccessful in their endeavours to account for the differences observed among mankind, therefore these differences cannot be accounted for from natural causes."

85
Inconsistency in Lord Kames's arguments.

His Lordship, however, tells us in the passages already quoted, that "a mastiff differs not more from a spaniel, than a Laplander from a Dane;" that "it is vain to ascribe to climate the low stature of the Laplanders, or their ugly visage."—Yet, in a note on the word *Laplunders*, he subjoins, that, "by late accounts it appears, that the Laplanders are only degenerated Tartars; and that they and the Hungarians originally sprung from the same breed of men, and from the same country."—The Hungarians are generally handsome and well-made, like Danes, or like other people. The Laplanders, he tells us, differ as much from them as a mastiff from a spaniel. Natural causes, therefore, according to Lord Kames himself, may cause two individuals of the same species of mankind differ from each other as much as a mastiff does from a spaniel.

86
Remarkable difference of colour from accidental causes.

While we are treating this subject of colour, it may not be amiss to observe, that a very remarkable difference of colour may accidentally happen to individuals of the same species. In the isthmus of Darien, a singular race of men have been discovered.—They are of low stature, of a feeble make, and incapable of enduring fatigue. Their colour is a dead milk white; not resembling that of fair people among Europeans, but without any blush or sanguine complexion. Their skin is covered with a fine hairy down of a chalky white; the hair of their heads, their eye-brows, and eye-lashes, are of the same hue. Their eyes are of a singular form, and so weak, that they can hardly bear the light of the sun; but they see clearly by moon-light, and are most active and gay in the night. Among the negroes of Africa, as well as the natives of the Indian islands, a small number of these people are produced. They are called *Albinos* by the Portuguese, and *Kack-rlakes* by the Dutch.

87
Colour no characteristic of a different species.

This race of men is not indeed permanent; but it is sufficient to show, that mere colour is by no means the characteristic of a certain species of mankind. The difference of colour in these individuals is undoubtedly owing to a natural cause. To constitute, then, a race of men of this colour, it would only be necessary that this cause, which at present is merely accidental, should become permanent, and we cannot know but it may be so in some parts of the world.

88
Not stature.

If a difference in colour is no characteristic of a different species of mankind, much less can a difference in stature be thought so.—In the southern parts of America, there are said to be a race of men exceeding the common size in height and strength*. This account, however, is doubted of by some; but be that as it will, it is certain that the Esquimaux are as much under the common size, as the Patagonians are said to be above it. Nevertheless we are not to imagine, that either of these are specific differences; seeing the Laplanders and Hungarians are both of the same species, and yet the former are generally almost a foot shorter than the latter; and if a difference of climate, or other accidental causes, can make the people of one country a foot shorter than the common size of mankind, un-

* See *Patagonia*.

doubtedly accidental causes of a contrary nature may make those of another country a foot taller than other men.

89
Different causes contribute towards an alteration in colour.

Though the sun has undoubtedly a share in the production of the swarthy colour of those nations which are most exposed to his influence; yet the manner of living to which people are accustomed, their victuals, their employment, &c. must contribute very much to a difference of complexion. There are some kinds of colouring roots, which, if mixed with the food of certain animals, will tinge even their bones of a yellow colour.—It cannot be thought any great degree of credulity to infer from this, that if these roots were mixed with the food of a white man, they might, without a miracle, tinge his skin of a yellow colour. If a man and woman were both to use food of this kind for a length of time, till they became as it were *radically dyed*, it is impossible, without the intervention of divine power, or of some extraordinary natural cause, but their children must be of the same colour; and was the same kind of food to be continued for several generations, it is more than probable that this colour might resist the continued use of any kind of food whatever. See further the article COMPLEXION.

Of this indeed we have no examples, but we have an example of changes much more wonderful.—It is allowed on all hands, that it is more easy to work a change upon the body of a man, or any other animal, than upon his mind. A man that is naturally choleric may indeed learn to prevent the bad effects of his passion by reason, but the passion itself will remain as immutable as his colour.—But to reason in a manner similar to Lord Kames; though a man should be naturally choleric, or subject to any other passion, why should his children be so?—This way of reasoning, however plausible, is by no means conclusive, as will appear from the following passage in Mr Forter's Voyage.

90
Habit capable of altering the instinct of animals.

June 9th. "The officers who could not yet relish their salt provisions after the refreshments of New Zealand, had ordered their black dog, mentioned p. 135, to be killed: this day, therefore, we dined for the first time on a leg of it roasted; which tasted so exactly like mutton, that it was absolutely undistinguishable. In our cold countries, where animal food is so much used, and where to be carnivorous perhaps lies in the nature of men, or is indispensibly necessary to the preservation of their health and strength, it is strange that there should exist a Jewish aversion to dogs-flesh, when hogs, the most uncleanly of all animals, are eaten without scruple. Nature seems expressly to have intended them for this use, by making their offspring so very numerous, and their increase so quick and frequent. It may be objected, that the exalted degree of instinct which we observe in our dogs, inspires us with great unwillingness to kill and eat them. But it is owing to the time we spend on the education of dogs, that they acquire those eminent qualities which attach them so much to us. The natural qualities of our dogs may receive a wonderful improvement; but education must give its assistance, without which the human mind itself, though capable of an immense expansion, remains in a very contracted state. In New Zealand, and (according to former accounts of voyages) in the tropical isles of the South Sea, the dogs are the most stupid, dull animals imaginable,

Voyage round the World, Vol. I. p. 234.

America. imaginable, and do not seem to have the least advantage in point of sagacity over our sheep, which are commonly made the emblems of fillinefs. In the former country they are fed upon fish, in the latter on vegetables, and both these diets may have served to alter their disposition. Education may perhaps likewise graft new instincts: the New Zealand dogs are fed on the remains of their master's meals; they eat the bones of other dogs; and the puppies become true cannibals from their birth. We had a young New Zealand puppy on board, which had certainly had no opportunity of tasting any thing but the mother's milk before we purchased it: however, it eagerly devoured a portion of the flesh and bones of the dog on which we dined today; while several others of the European breed taken on board at the Cape, turned from it without touching it.

Ibid. p. 243. "On the 4th of August, a young bitch, of the terrier breed, taken on board at the Cape of Good Hope, and covered by a spaniel, brought ten young ones, one of which was dead. The New Zealand dog mentioned above, which devoured the bones of the roasted dog, now fell upon the dead puppy, and eat of it with a ravenous appetite. This is a proof how far education may go in producing and propagating new instincts in animals. European dogs are never fed on the meat of their own species, but rather seem to abhor it. The New Zealand dogs, in all likelihood, are trained up from their earliest age to eat the remains of their master's meals: they are therefore used to feed upon fish; their own species; and perhaps human flesh; and what was only owing to habit at first, may have become instinct by length of time. This was remarkable in our cannibal dog; for he came on board so young, that he could not have been weaned long enough to have acquired a habit of devouring his own species, and much less of eating human flesh; however, one of our seamen having cut his finger, held it out to the dog, who fell to greedily, licked it, and then began to bite it."

From this account it appears, that even the instincts of animals are not unchangeable by natural causes; and if these causes are powerful enough to change the dispositions of succeeding generations, much more may we suppose them capable of making any possible alteration in the external appearance.

¹⁰⁰ We are not here necessitated to confine ourselves to observations made on brute animals. The Franks are an example of the production of one general character, formed by some natural cause from a mixture of many different nations.—They were a motley multitude, consisting of various German nations dwelling beyond the Rhine: who, uniting in defence of their common liberty, took thence the name of *Franks*; the word *frank* signifying in their language, as it still does in ours, *free*. Among them the following nations were mentioned, viz. the Actuarii, Chamavi, Bructeri, Sali, Frisi, Chauvi, Amfarii, and Catti. We cannot suppose one character to belong to so many different nations; yet it is certain that the Franks were nationally characterized as treacherous; and so deeply seems this quality to have been rooted in their nature, that their descendants have not got quite free of it in 1500 years. It is in vain, then, to talk of different races of men, either from their colour, size, or prevailing dispositions, seeing we have undeniable proofs that all these

may be changed, in the most remarkable manner, by natural causes, without any miraculous interposition of the Deity. America.

The next question, then, which presents itself, is, From what part of the Old World America has most probably been peopled?

Discoveries long ago made inform us, that an intercourse between the Old continent and America might be carried on with facility from the north-west extremities of Europe and the north-east boundaries of Asia. In the ninth century the Norwegians discovered Greenland, and planted a colony there. The communication with that country was renewed in the last century by Moravian missionaries, in order to propagate their doctrines in that bleak and uncultivated region. By them we are informed that the north-west coast of Greenland is separated from America by a very narrow strait; that at the bottom of the bay it is highly probable that they are united; that the Esquimaux of America perfectly resemble the Greenlanders in their aspect, dress, and mode of living; and that a Moravian missionary, well acquainted with the language of Greenland, having visited the country of the Esquimaux, found, to his astonishment, that they spoke the same language with the Greenlanders, and were in every respect the same people. The same species of animals, too, are found in the contiguous regions. The bear, the wolf, the fox, the hare, the deer, the roebuck, the elk, frequent the forests of North America, as well as those in the north of Europe.

Other discoveries have proved, that if the two continents of Asia and America be separated at all, it is only by a narrow strait. From this part of the Old continent, also, inhabitants may have passed into the New; and the resemblance between the Indians of America and the eastern inhabitants of Asia, would induce us to conjecture that they have a common origin. This is the opinion adopted by Dr Robertson in his History of America*, where we find it accompanied with the following narrative.

"While those immense regions which stretched eastward from the river Oby to the sea of Kamtschatka were unknown, or imperfectly explored, the north-east extremities of our hemisphere were supposed to be so far distant from any part of the New World, that it was not easy to conceive how any communication should have been carried on between them. But the Russians, having subjected the western part of Siberia to their empire, gradually extended their knowledge of that vast country, by advancing towards the east into unknown provinces. These were discovered by hunters in their excursions after game, or by soldiers employed in levying the taxes; and the court of Moscow estimated the importance of those countries only by the small addition which they made to its revenue. At length, Peter the Great ascended the Russian throne: His enlightened, comprehensive mind, intent upon every circumstance that could aggrandize his empire, or render his reign illustrious, discerned consequences of those discoveries, which had escaped the observation of his ignorant predecessors. He perceived, that, in proportion as the regions of Asia extended towards the east, they must approach nearer to America; that the communication between the two continents, which had long been search-

^{101:} Of the peopling of America.

¹⁰² A communication between the Old and New Continents by two ways.

* History of America, Vol. I. p. 273.

ed

^{America.} ed for in vain, would probably be found in this quarter; and that, by opening this intercourse, some part of the wealth and commerce of the western world might be made to flow into his dominions by a new channel. Such an object suited a genius that delighted in grand schemes. Peter drew up instructions with his own hand for prosecuting this design, and gave orders for carrying it into execution.

“His successors adopted his ideas, and pursued his plan. The officers whom the Russian court employed in this service, had to struggle with so many difficulties, that their progress was extremely slow. Encouraged by some faint traditions among the people of Siberia concerning a successful voyage in the year 1648 round the north-east promontory of Asia, they attempted to follow the same course. Vessels were fitted out, with this view, at different times, from the rivers Lena and Kolyma; but in a frozen ocean, which nature seems not to have destined for navigation, they were exposed to many disasters, without being able to accomplish their purpose. No vessel fitted out by the Russian court ever doubled this formidable cape; we are indebted for what is known of those extreme regions of Asia, to the discoveries made in excursions by land. In all those provinces, an opinion prevails, that countries of great extent and fertility lie at no considerable distance from their own coasts. These the Russians imagined to be part of America; and several circumstances concurred not only in confirming them in this belief, but in persuading them that some portion of that continent could not be very remote. Trees of various kinds, unknown in those naked regions of Asia, are driven upon the coast by an easterly wind. By the same wind floating ice is brought thither in a few days; flights of birds arrive annually from the same quarter; and a tradition obtains among the inhabitants, of an intercourse formerly carried on with some countries situated to the east.

“After weighing all these particulars, and comparing the position of the countries in Asia which they had discovered, with such parts in the north-west of America as were already known; the Russian court formed a plan, which would have hardly occurred to any nation less accustomed to engage in arduous undertakings and to contend with great difficulties. Orders were issued to build two vessels at Ochotz, in the sea of Kamtschatka, to sail on a voyage of discovery. Though that dreary uncultivated region furnished nothing that could be of use in constructing them but some larch-trees; though not only the iron, the cordage, the sails, and all the numerous articles requisite for their equipment, but the provisions for victualling them, were to be carried through the immense deserts of Siberia, along rivers of difficult navigation, and roads almost impassable, the mandate of the sovereign, and the perseverance of the people, at last surmounted every obstacle. Two vessels were finished; and, under the command of the captains Behring and Tschirikow, sailed from Kamtschatka in quest of the New World, in a quarter where it had never been approached. They shaped their course towards the east; and though a storm soon separated the vessels, which never rejoined, and many disasters befel them, the expectations from the voyage were not altogether frustrated. Each of the commanders discovered land, which to them appeared

to be part of the American continent; and, according to their observations, it seems to be situated within a few degrees of the north-west coast of California. Each set some of his people ashore: but in one place the inhabitants fled as the Russians approached; in another, they carried off those who landed, and destroyed their boats. The violence of the weather, and the distress of their crews, obliged both to quit this inhospitable coast. In their return they touched at several islands, which stretch in a chain from east to west between the country which they had discovered and the coast of Asia. They had some intercourse with the natives, who seemed to them to resemble the North Americans. They presented to the Russians the calumet, or pipe of peace, which is a symbol of friendship universal among the people of North America, and an usage of arbitrary institution peculiar to them.”

The more recent and accurate discoveries of the illustrious navigator Cooke, and his successor Clerke, have brought the matter still nearer to certainty. The sea, from the south of Bering's Straits to the crescent of isles between Asia and America, is very shallow. It deepens from these straits (as the British seas do from those of Dover) till soundings are lost in the Pacific Ocean; but that does not take place but to the south of the isles. Between them and the straits is an increase from 12 to 54 fathom, except only off St Thaddeus Nos, where there is a channel of greater depth. From the volcanic disposition, it has been judged probable, not only that there was a separation of the continents at the straits of Bering, but that the whole space from the isles to that small opening had once been occupied by land; and that the fury of the watery element, actuated by that of fire, had, in most remote times, subverted and overwhelmed the tract, and left the islands monumental fragments.

Without adopting all the fancies of Buffon, there can be no doubt, as the Abbé Clavigero observes, that our planet has been subject to great vicissitudes since the deluge. Ancient and modern histories confirm the truth which Ovid has sung in the name of Pythagoras:

*Vides ego quod fuerat quondam solidissima tellus,
Esse fretum; vidi factas ex æquore terras.*

At present they plough those lands over which ships formerly sailed, and now they sail over lands which were formerly cultivated; earthquakes have swallowed some lands, and subterraneous fires have thrown up others; the rivers have formed new soil with their mud; the sea retreating from the shores has lengthened the land in some places, and advancing in others has diminished it; it has separated some territories which were formerly united, and formed new straits and gulphs. We have examples of all these revolutions in the past century. Sicily was united to the continent of Naples, as Eubea, now the Black Sea, to Bœotia. Diodorus, Strabo, and other ancient authors, say the same thing of Spain and Africa, and affirm, that by a violent eruption of the ocean upon the land between the mountains Abyla and Calpe, that communication was broken, and the Mediterranean Sea was formed. Among the people of Ceylon there is a tradition that a similar irruption of the sea separated their island from the peninsula of India. The same thing is believed by those of Malabar with respect to the isles of Maldivia, and

America. and with the Malayans with respect to Sumatra. It is certain, says the Count de Buffon, that in Ceylon the earth has lost 30 or 40 leagues, which the sea has taken from it; on the contrary, Tongres, a place of the Low Countries, has gained 30 leagues of land from the sea. The northern part of Egypt owes its existence to inundations of the Nile. The earth which this river has brought from the inland countries of Africa, and deposited in its inundations, has formed a soil of more than 25 cubits of depth. In like manner, adds the above author, the province of the Yellow River in China, and that of Louisiana, have only been formed of the mud of rivers. Pliny, Seneca, Diodorus, and Strabo, report innumerable examples of similar revolutions, which we omit, that our dissertation may not become too prolix; as also many modern revolutions, which are related in the theory of the earth of the Count de Buffon and other authors. In South America, all those who have observed with philosophic eyes the peninsula of Yucatan, do not doubt that that country has once been the bed of the sea; and, on the contrary, in the channel of Bahama many indications show the island of Cuba to have been once united to the continent of Florida. In the strait which separates America from Asia many islands are found, which probably were the mountains belonging to that tract of land which we suppose to have been swallowed up by earthquakes; which is made more probable by the multitude of volcanoes which we know of in the peninsula of Kamtschatka. It is imagined, however, that the sinking of that land, and the separation of the two continents, has been occasioned by those great and extraordinary earthquakes mentioned in the histories of the Americans, which formed an era almost as memorable as that of the deluge. The histories of the Toltecas six such earthquakes in the year I Tecpatl; but as we know not to what century that belonged, we can form no conjecture of the time that great calamity happened. If a great earthquake should overwhelm the isthmus of Suez, and there should be at the same time as great a scarcity of historians as there were in the first ages after the deluge, it would be doubted, in 300 or 400 years after, whether Asia had ever been united by that part to Africa; and many would firmly deny it.

Whether that great event, the separation of the continents, took place before or after the population of America, is as impossible as it is of little moment for us to know; but we are indebted to abovementioned navigators for settling the long dispute about the point from which it was effected. Their observations prove, that in one place the distance between continent and continent is only 39 miles, not (as the author of the *Recherches Philosophiques sur les Americains* would have it) 800 leagues. This narrow strait has also in the middle two islands, which would greatly facilitate the migration of the Asiatics into the New World, supposing that it took place in canoes after the convulsion which rent the two continents asunder. Besides, it may be added, that these straits are, even in the summer, often filled with ice; in winter, often frozen. In either case mankind might find an easy passage; in the last, the way was extremely ready for quadrupeds to cross and flock the continent of America. But where, from the vast expanse of the north-eastern world, to fix on the first tribes who contributed to people the New

105 Separated only by a narrow strait.

106 easiness of the passage between them.

continent, now inhabited almost from end to end, is a matter that baffles human reason. The learned may make bold and ingenious conjectures, but plain good sense cannot always accede to them.

As mankind increased in numbers, they naturally protruded one another forward. Wars might be another cause of migrations. There appears no reason why the Asiatic north might not be an *officina virorum*, as well as the European. The overteeming country, to the east of the Riphæan mountains, must find it necessary to discharge its inhabitants: the first great wave of people was forced forward by the next to it, more tumid and more powerful than itself: successive and new impulses continually arriving, short rest was given to that which spread over a more eastern tract; disturbed again and again, it covered fresh regions; at length, reaching the farthest limits of the Old World, found a new one, with ample space to occupy unmolested for ages; till Columbus cursed them by a discovery, which brought again new sins and new deaths to both worlds.

“The inhabitants of the New World (Mr Pennant observes), do not consist of the offspring of a single nation: different people, at several periods, arrived there; and it is impossible to say, that any one is now to be found on the original spot of its colonization. It is impossible, with the lights which we have so recently received, to admit that America could receive its inhabitants (at least the bulk of them) from any other place than eastern Asia. A few proofs may be added, taken from customs or dresses common to the inhabitants of both worlds: some have been long extinct in the old, others remain in both in full force.

“The custom of scalping was a barbarism in use with the Scythians, who carried about them at all times this savage mark of triumph: they cut a circle round the neck, and stripped off the skin, as they would that of an ox. A little image, found among the Kalmucs, of a Tartarian deity, mounted on a horse, and sitting on a human skin, with scalps pendent from the breast, fully illustrates the custom of the Scythian progenitors, as described by the Greek historian. This usage, as the Europeans know by horrid experience, is continued to this day in America. The ferocity of the Scythians to their prisoners extended to the remotest part of Asia. The Kamtschatkans, even at the time of their discovery by the Russians, put their prisoners to death by the most lingering and excruciating inventions; a practice in full force to this very day among the aboriginal Americans. A race of the Scythians were styled *Anthropophagi*, from their feeding on human flesh. The people of Nootka Sound still make a repast on their fellow-creatures: but what is more wonderful, the savage allies of the British army have been known to throw the mangled limbs of the French prisoners into the horrible cauldron, and devour them with the same relish as those of a quadruped.

“The Scythians were said, for a certain time, annually to transform themselves into wolves, and again to resume the human shape. The new discovered Americans about Nootka Sound, at this time disguise themselves in dresses made of the skins of wolves and other wild beasts, and wear even the heads fitted to their own. These habits they use in the chase, to circumvent the animals of the field. But would not ignorance or superstition ascribe to a supernatural metamorphosis.

Customs
and dresses
common to
the eastern
Asiatic and
the Ameri-
cans.

" In their marches, the Kamtschatkans never went abreast, but followed one another in the same tract. The same custom is exactly observed by the Americans.

" The Tungusi, the most numerous nation resident in Siberia, prick their faces with small punctures, with a needle, in various shapes; then rub into them charcoal, so that the marks become indelible. This custom is still observed in several parts of America. The Indians on the back of Hudson's bay, to this day, perform the operation exactly in the same manner, and puncture the skin into various figures; as the natives of New Zealand do at present, and as the ancient Britons did with the herb glastum, or woad; and the Virginians, on the first discovery of that country by the English.

" The Tungusi use canoes made of birch-bark, distended over ribs of wood, and nicely sewed together. The Canadian, and many other American nations, use no other sort of boats. The paddles of the Tungusi are broad at each end; those of the people near Cook's river, and of Onalafcha, are of the same form.

" In burying of the dead, many of the American nations place the corpse at full length, after preparing it according to their customs; others place it in a sitting posture, and lay by it the most valuable cloathing, wampum, and other matters. The Tartars did the same: and both people agree in covering the whole with earth, so as to form a tumulus, barrow, or carnedd.

" Some of the American nations hang their dead in trees. Certain of the Tungusi observe a similar custom.

" We can draw some analogy from dress: convenience in that article must have been consulted on both continents, and originally the materials must have been the same, the skins of birds and beasts. It is singular, that the conic bonnet of the Chinese should be found among the people of Nootka. I cannot give into the notion, that the Chinese contributed to the population of the New World; but we can readily admit, that a shipwreck might furnish those Americans with a pattern for that part of the dress.

112
Other re-
semblances.

" In respect to the features and form of the human body, almost every tribe found along the western coast has some similitude to the Tartar nations, and still retain the little eyes, small noses, high cheeks, and broad faces. They vary in size, from the lusty Calmucs to the little Nogaïans. The internal Americans, such as the Five Indian nations, who are tall of body, robust in make, and of oblong faces, are derived from a variety among the Tartars themselves. The fine race of Tschutski seem to be the stock from which those Americans are derived. The Tschutski, again, from that fine race of Tartars the Kabardinski, or inhabitants of Kabarda.

" But about Prince William's Sound begins a race chiefly distinguished by their dress, their canoes, and their instruments of the chase, from the tribes to the south of them. Here commences the Esquimaux people, or the race known by that name in the high latitudes of the eastern side of the continent. They may be divided into two varieties. At this place they are

N^o 15.

of the largest size. As they advance northward they decrease in height, till they dwindle into the dwarfish tribes which occupy some of the coasts of the Icy Sea, and the maritime parts of Hudson's Bay, of Greenland, and Terra de Labrador. The famous Japanese map places some islands seemingly within the Straits of Bering, on which is bestowed the title of *Ya Zue*, or the Kingdom of the Dwarfs. Does not this in some manner authenticate the chart, and give us reason to suppose that America was not unknown to the Japanese; and that they had (as is mentioned by Kæmpfer and Charlevoix) made voyages of discovery, and, according to the last, actually wintered on the continent? That they might have met with the Esquimaux is very probable; whom, in comparison of themselves, they might justly distinguish by the name of *dwarfs*. The reason of their low stature is very obvious: these dwell in a most severe climate, amidst penury of food; the former in one much more favourable, abundant in provisions; circumstances that tend to prevent the degeneracy of the human frame. At the island of Onalafcha, a dialect of the Esquimaux is in use, which was continued along the whole coast from thence northward."

The continent which stocked America with the hu-
man race poured in the brute creation through the
same passage. Very few quadrupeds continued in the
peninsula of Kamtschatka; Mr Pennant enumerates
only 25 which are inhabitants of land: all the rest
persisted in their migration, and fixed their residence
in the New World. Seventeen of the Kamtschatkan
quadrupeds are found in America: others are common
only to Siberia or Tartary, having, for unknown
causes, entirely evacuated Kamtschatka, and divided
themselves between America and the parts of Asia
above cited. Multitudes again have deserted the Old
World, even to an individual, and fixed their seats at
distances most remote from the spot from which they
took their departure; from mount Ararat, the resting-
place of the ark, in a central part of the Old World,
and excellently adapted for the dispersion of the ani-
mal creation to all its parts. " We need not be startled
(says Mr Pennant) at the vast journeys many of the
quadrupeds took to arrive at their present seats. Might
not numbers of species have found a convenient abode
in the vast Alps of Asia, instead of wandering to the
Cordilleras of Chili? or might not others have been
contented with the boundless plains of Tartary, in-
stead of travelling thousands of miles to the extensive
flats of Pampas?—To endeavour to elucidate common
difficulties is certainly a trouble worthy of the philo-
sopher and of the divine; not to attempt it would be
a criminal indolence, a neglect to

Vindicate the ways of God to man.

But there are multitudes of points beyond the human ability to explain, and yet are truths undeniable: the facts are indisputable, notwithstanding the causes are concealed. In such cases, faith must be called in to our relief. It would certainly be the height of folly to deny to that Being who broke open the great fountains of the deep to effect the deluge—and afterwards, to compel the dispersion of mankind to people the globe, directed the confusion of languages—powers inferior in their nature to these. After these wondrous

route.

America. wondrous proofs of Omnipotency, it will be absurd to deny the possibility of infusing instinct into the brute creation. *Deus est anima brutorum*; "God himself is the soul of brutes." His pleasure must have determined their will, and directed several species, and even whole genera, by impulse irresistible, to move by slow progression to their destined regions. But for that, the llama and the pacos might still have inhabited the heights of Armenia and some more neighbouring Alps, instead of labouring to gain the distant Peruvian Andes; the whole genus of armadillos, slow of foot, would never have quitted the torrid zone of the Old World for that of the New; and the whole tribe of monkeys would have gambled together in the forests of India, instead of dividing their residence between the shades of Indostan and the deep forests of the Brasils. Lions and tigers might have infested the hot parts of the New World, as the first do the deserts of Africa, and the last the provinces of Asia; or the pantherine animals of South America might have remained additional scourges with the savage beasts of those ancient continents. The Old World would have been overstocked with animals; the New remained an unanimated waste! or both have contained an equal portion of every beast of the earth. Let it not be objected, that animals bred in a southern climate, after the descent of their parents from the ark, would be unable to bear the frost and snow of the rigorous north, before they reached South America, the place of their final destination. It must be considered, that the migration must have been the work of ages; that in the course of their progress each generation grew hardened to the climate it had reached; and that after their arrival in America, they would again be gradually accustomed to warmer and warmer climates, in their removal from north to south, as they had in the reverse, or from south to north. Part of the tigers still inhabit the eternal snows of Ararat, and multitudes of the very same species live, but with exalted rage, beneath the line, in the burning soil of Borneo or Sumatra; but neither lions or tigers ever migrated into the New World. A few of the first are found in India and Persia, but they are found in numbers only in Africa. The tiger extends as far north as western Tartary, in lat. 40. 50, but never has reached Africa."

In fine, the conjectures of the learned respecting the vicinity of the Old and New, are now, by the discoveries of our great navigators, lost in conviction; and, in the place of imaginary hypotheses, the real place of migration is uncontrovertibly pointed out. Some (from a passage in Plato) have extended over the Atlantic, from the straits of Gibraltar to the coast of North and South America, an island equal in size to the continents of Asia and Africa; over which had passed, as over a bridge, from the latter, men and animals; wool-headed negroes, and lions and tigers, none of which ever existed in the New World. A mighty sea arose, and in one day and night engulfed this stupendous tract, and with it every being which had not completed its migration into America. The whole negro race, and almost every quadruped, now inhabitants of Africa, perished in this critical day. Five only are to be found at present in America; and of these only one, the bear, in South America: Not a single custom, common to the natives of Africa and

Vol. I. Part II.

America. to evince a common origin. Of the quadrupeds, the bear, stag, wolf, fox, and weasel, are the only animals which we can pronounce with certainty to be found on each continent. The stag, fox, and weasel, have made also no farther progress in Africa than the north; but on the same continent the wolf is spread over every part, yet is unknown in South America, as are the fox and weasel. In Africa and South America the bear is very local, being met with only in the north of the first, and on the Andes in the last. Some cause unknown arrested its progress in Africa, and impelled the migration of a few into the Chilian Alps, and induced them to leave unoccupied the vast tract from North America to the lofty Cordilleras.

Allusions have often been made to some remains on the continent of America, of a more polished and cultivated people, when compared with the tribes which possessed it on its first discovery by Europeans. Mr Barton, in his *Observations on some parts of Natural History*, Part I. has collected the scattered hints of Kalm, Carver, and some others, and has added a plan of a regular work, which has been discovered on the banks of the Muskingum, near its junction with the Ohio. These remains are principally stone-walls, large mounds of earth, and a combination of these mounds with the walls, suspected to have been fortifications. In some places the ditches and the fortrefs are said to have been plainly seen; in others, furrows, as if the land had been ploughed.

The mounds of earth are of two kinds: they are artificial tumuli, designed as repositories for the dead; or they are of a greater size, for the purpose of defending the adjacent country; and with this view they are artificially constructed, or advantage is taken of the natural eminences, to raise them into a fortification.

The remains near the banks of the Muskingum, are situated about one mile above the junction of that river with the Ohio, and 160 miles below Fort Pitt. They consist of a number of walls and other elevations, of ditches, &c. altogether occupying a space of ground about 300 perches in length, and from about 150 to 25 or 20 in breadth. The town, as it has been called, is a large level, encompassed by walls, nearly in the form of a square, the sides of which are from 96 to 86 perches in length. These walls are, in general, about 10 feet in height above the level on which they stand, and about 20 feet in diameter at the base, but at the top they are much narrower: they are at present overgrown with vegetables of different kinds, and, among others, with trees of several feet diameter. The chasms, or openings in the walls, were probably intended for gate-ways: they are three in number at each side, besides the smaller openings in the angles. Within the walls there are three elevations, each about six feet in height, with regular ascents to them: these elevations considerably resemble some of the eminences already mentioned, which have been discovered near the river Mississippi. This author's opinion is, That the Toltecas, or some other Mexican nation, were the people to whom the mounds and fortifications, which he has described, owe their existence; and that those people were probably the descendants of the Danes. The former part of this conjecture is thought probable, from the similarity of the Mexican mounds

114
Remains of
antiquity in
America.

America. and fortifications described by the Abbé Clavigero, and other authors, to those described by our author; and from the tradition of the Mexicans, that they come from the north-west: for, if we can rely on the testimony of late travellers, fortifications similar to those mentioned by Mr Barton have been discovered as far to the north as Lake Pepin; and we find them, as we approach to the south, even as low as the coasts of Florida. The second part of our author's conjecture appears not so well supported.

115
The ancients supposed to have had some imperfect notion of a new world.

It is believed by many, that the ancients had some imperfect notion of a new world; and several ancient authors are quoted in confirmation of this. In a book ascribed to the philosopher Aristotle, we are told that the Carthaginians discovered an island far beyond the pillars of Hercules, large, fertile, and finely watered with navigable rivers, but uninhabited. This island was distant a few days sailing from the continent; its beauty induced the discoverers to settle there; but the policy of Carthage dislodged the colony, and laid strict prohibition on all the subjects of the state not to attempt any future establishment. This account is also confirmed by an historian of no mean credit, who relates, that the Tyrians would have settled a colony on the new-discovered island, but were opposed by the Carthaginians for state reasons. The following passage has also been quoted from Seneca's *Medea*, in confirmation of this notion.

— *Venient annis
Secula seris, quibus oceanus
Vincula rerum laxet, & ingens
Pateat tellus, Typhisque novos
Delegat orbis; nec sit terris
Ultima Thule.* —

ACT. iii. ver. 375.

116
Pretensions of the Welsh to the discovery of America in the 12th century.

Other authors are also quoted in support of this belief. But however this may be, nobody ever believed the existence of this continent so firmly as to go in quest of it; at least, there are no accounts well supported that America received any part of its first inhabitants from Europe prior to the 15th century. The Welsh fondly imagine that our country contributed, in 1170, to people the New World, by the adventure of Madoc, son of Owen Gwynedd, who, on the death of his father, failed there, and colonized part of the country. All that is advanced in proof is, a quotation from one of our poets, which proves no more than that he had distinguished himself by sea and land. It is pretended that he made two voyages: that sailing west, he left Ireland so far to the north, that he came to a land unknown, where he saw many strange things; that he returned home, and, making a report of the fruitfulness of the new-discovered country, prevailed on numbers of the Welsh of each sex to accompany him on a second voyage; from which he never returned. The favourers of this opinion assert, that several Welsh words, such as *gawrando*, "to hearken or listen;" the isle of *Croeso*, or "welcome;" *Cape Breton*, from the name of our own island; *gwynndwr*, or "the white water;" and *pengwin*, or "the bird with a white head;" are to be found in the American language. But likeness of sound in a few words will not be deemed sufficient to establish the fact; especially if the meaning has been evidently perverted: for example, the whole penguin

tribe have unfortunately not only black heads, but are not inhabitants of the northern hemisphere; the name was also bestowed on them by the Dutch, à *pinguedine*, from their excessive fatness: but the inventor of this, thinking to do honour to our country, inconsiderately caught at a word of European origin, and unheard of in the New World. It may be added, that the Welsh were never a naval people; that the age in which Madoc lived was peculiarly ignorant in navigation; and the most which they could have attempted must have been a mere coasting voyage.

America.

The Norwegians put in for a share of the glory, on grounds rather better than the Welsh. By their settlements in Iceland and in Greenland, they had arrived within so small a distance of the New World, that there is at least a possibility of its having been touched at by a people so versed in maritime affairs, and so adventurous, as the ancient Northmen were. The proofs are much more numerous than those produced by the British historians; for the discovery is mentioned in several of the Icelandic manuscripts. The period was about the year 1002, when it was visited by one Biorn; and the discovery pursued to greater effect by Leif, the son of Eric, the discoverer of Greenland. It does not appear that they reached farther than Labrador; on which coast they met with Esquimaux, on whom they bestowed the name of *Skrælingues*, or dwarfish people, from their small stature. They were armed with bows and arrows, and had leathern canoes, such as they have at present. All this is probable; nor should the tale of the German, called *Turkil*, one of the crew, invalidate the account. He was one day missing; but soon returned, leaping and singing with all the extravagant marks of joy a *bon vivant* could show, on discovering the inebriating fruit of his country, the grape: Torfæus even says, that he returned in a state of intoxication. To convince his commander, he brought several bunches, who from that circumstance named the country *Vinland*. It is not to be denied that North America produces the true vine; but it is found in far lower latitudes than our adventurers could reach in the time employed in their voyage, which was comprehended in a very small space. There appears no reason to doubt of the discovery; but as the land was never colonized, nor any advantages made of it, it may be fairly conjectured, that they reached no farther than the barren country of Labrador. In short, it is from a much later period that we must date the real discovery of America.

117
Those of the Norwegians better founded.

Towards the close of the 15th century, Venice and Genoa being rivals in commerce, in which the former had greatly the superiority, Christopher Columbus, a native of Genoa, whose knowledge of the true figure of the earth, however attained, was much superior to the general notions of the age in which he lived, conceived a project of sailing to the East Indies by directing his course westward. This design was founded upon a mistake of the geographers of those days, who placed the eastern parts of Asia immensely too far to the eastward; so that had they been in the right, the shortest way would have been to sail directly westward. He applied first to his own countrymen; but being rejected by them, he applied to France, where he was laughed at and ridiculed. He next applied to Henry VII. of England; but meeting with a disappointment there,

118
The projects of Christopher Columbus.

he

America. he made an application to Portugal, where he met with the same mortifying reception. Spain was his next resource; where, after eight years attendance, he obtained, in 1492, a fleet of three ships. The largest, a ship of no considerable burden, was commanded by Columbus as admiral, who gave it the name of *Santa Maria*, out of respect for the blessed Virgin, whom he honoured with singular devotion. Of the second, called the *Pinta*, Martin Pinzon was captain, and his brother Francis pilot. The third, named the *Nigna*, was under the command of Vincent Yanez Pinzon. These two were light vessels, hardly superior in burden or force to large boats. This Squadron, if it merits that name, was victualled for 12 months, and had on board 90 men, mostly sailors, together with a few adventurers who followed the fortune of Columbus, and some gentlemen of Isabella's court, whom she appointed to accompany him. Though the expence of the undertaking was one of the circumstances which chiefly alarmed the court of Spain, and retarded so long the negotiation with Columbus, the sum employed in fitting out this squadron did not exceed 4000 l. But as Columbus was deeply impressed with sentiments of religion, he would not set out upon an expedition so arduous, and of which one great object was to extend the knowledge of the Christian faith, without imploring publicly the guidance and protection of Heaven. With this view, he, together with all the persons under his command, marched in solemn procession to the monastery of Rabida. After confessing their sins, and obtaining absolution, they received the holy sacrament from the hands of the guardian, who joined his prayers to theirs for the success of an enterprise which he had so zealously patronized.

119
His voyage.

Next morning, being Friday the third day of August in the year 1492, Columbus set sail, a little before sun-rise, in presence of a vast crowd of spectators, who sent up their supplications to Heaven for the prosperous issue of the voyage, which they wished, rather than expected. Columbus steered directly for the Canary islands, and arrived there without any occurrence that would have deserved notice on any other occasion: but in a voyage of such expectation and importance, every circumstance was the object of attention. The rudder of the *Pinta* broke loose the day after she left the harbour, and that accident alarmed the crew, no less superstitious than unskilful, as a certain omen of the unfortunate destiny of the expedition. Even in the short run to the Canaries, the ships were found to be so crazy and ill appointed, as to be very improper for a navigation which was expected to be both long and dangerous. Columbus refitted them, however, to the best of his power; and having supplied himself with fresh provisions, he took his departure from Gomera, one of the most westerly of the Canary islands, on the sixth day of September.

Here the voyage of discovery may properly be said to begin; for Columbus, holding his course due west, left immediately the usual track of navigation, and stretched into unfrequented and unknown seas. The first day, as it was very calm, he made but little way; but on the second, he lost sight of the Canaries; and many of the sailors, dejected already and dismayed, when they contemplated the boldness of the undertaking, began to beat their breasts, and to shed tears, as

if they were never more to behold land. Columbus comforted them with assurances of success, and the prospect of vast wealth, in those opulent regions whither he was conducting them. He regulated every thing by his sole authority; he superintended the execution of every order; and allowing himself only a few hours for sleep, he was at all other times upon deck. As his course lay through seas which had not formerly been visited, the sounding-line, or instruments for observation, were continually in his hands. After the example of the Portuguese discoverers, he attended to the motion of tides and currents, watched the flight of birds, the appearance of fishes, of sea-weeds, and of every thing that floated on the waves, and entered every occurrence, with a minute exactness, in the journal which he kept. As the length of the voyage could not fail of alarming sailors habituated only to short excursions, Columbus endeavoured to conceal from them the real progress which they made. With this view, though they run 18 leagues on the second day after they left Gomera, he gave out that they had advanced only 15, and he uniformly employed the same artifice of reckoning short during the whole voyage. By the 14th of September, the fleet was above 200 leagues to the west of the Canary isles, at a greater distance from land than any Spaniard had been before that time. There they were struck with an appearance no less astonishing than new. They observed that the magnetic needle, in their compasses, did not point exactly to the polar star, but varied towards the west; and as they proceeded, this variation increased. This appearance, which is now familiar, though it still remains one of the mysteries of nature, into the cause of which the sagacity of man hath not been able to penetrate, filled the companions of Columbus with terror. They were now in a boundless unknown ocean, far from the usual course of navigation; nature itself seemed to be altered, and the only guide which they had left was about to fail them. Columbus, with no less quickness than ingenuity, invented a reason for this appearance, which, though it did not satisfy himself, seemed so plausible to them, that it dispelled their fears, or silenced their murmurs.

He still continued to steer due west, nearly in the same latitude with the Canary islands. In this course he came within the sphere of the trade-wind, which blows invariably from east to west, between the tropics and a few degrees beyond them. He advanced before this steady gale with such uniform rapidity, that it was seldom necessary to shift a sail. When about 400 leagues to the west of the Canaries, he found the sea so covered with weeds, that it resembled a meadow of vast extent; and in some places they were so thick, as to retard the motion of the vessels. This strange appearance occasioned new alarm and disquiet. The sailors imagined that they were now arrived at the utmost boundary of the navigable ocean; that these floating weeds would obstruct their farther progress, and concealed dangerous rocks, or some large tract of land, which had sunk, they knew not how, in that place. Columbus endeavoured to persuade them, that what had alarmed, ought rather to have encouraged them, and was to be considered as a sign of approaching land. At the same time, a brisk gale arose, and carried them forward. Several birds were seen hovering about the ship,

America.

120
Astonishment occasioned by observing the variation of the compass.

America. and directed their flight towards the west. The desponding crew resumed some degree of spirit, and began to entertain fresh hopes.

Upon the first of October they were, according to the admiral's reckoning, 770 leagues to the west of the Canaries; but lest his men should be intimidated by the prodigious length of the navigation, he gave out that they had proceeded only 584 leagues; and, fortunately for Columbus, neither his own pilot, nor those of the other ships, had skill sufficient to correct this error, and discover the deceit. They had now been above three weeks at sea; they had proceeded far beyond what former navigators had attempted or deemed possible; all their prognostics of discovery, drawn from the flight of birds and other circumstances, had proved fallacious; the appearances of land, with which their own credulity or the artifice of their commander had from time to time flattered and amused them, had been altogether illusive, and their prospect of success seemed now to be as distant as ever. These reflections occurred often to men, who had no other object or occupation, than to reason and discourse concerning the intention and circumstances of their expedition. They made impression at first upon the ignorant and timid, and extending by degrees to such as were better informed or more resolute, the contagion spread at length from ship to ship. From secret whispers or murmurings, they proceeded to open cabals and public complaints. They taxed their sovereign with inconsiderate credulity, in paying such regard to the vain promises and rash conjectures of an indigent foreigner, as to hazard the lives of so many of her own subjects, in prosecuting a chimerical scheme. They affirmed that they had fully performed their duty, by venturing so far in an unknown and hopeless course, and could incur no blame, for refusing to follow, any longer, a desperate adventurer to certain destruction. They contended, that it was necessary to think of returning to Spain, while their crazy vessels were still in a condition to keep the sea, but expressed their fears that the attempt would prove vain, as the wind, which had hitherto been so favourable to their course, must render it impossible to sail in the opposite direction. All agreed that Columbus should be compelled by force to adopt a measure on which their common safety depended. Some of the more audacious proposed, as the most expeditious and certain method for getting rid at once of his remonstrances, to throw him into the sea; being persuaded that, upon their return to Spain, the death of an unsuccessful projector would excite little concern, and be inquired into with no curiosity.

121
Perilous situation of Columbus.

Columbus was fully sensible of his perilous situation. He had observed, with great uneasiness, the fatal operation of ignorance and of fear in producing disaffection among his crew; and saw that it was now ready to burst out into open mutiny. He retained, however, perfect presence of mind. He affected to seem ignorant of their machinations. Notwithstanding the agitation and solicitude of his own mind, he appeared with a cheerful countenance; like a man satisfied with the progress which he had made, and confident of success. Sometimes he employed all the arts of insinuation to soothe his men. Sometimes he endeavoured to work upon their ambition or avarice, by magnificent descriptions of the fame and wealth which they were

about to acquire. On other occasions, he assumed a tone of authority, and threatened them with vengeance from their sovereign, if, by their dastardly behaviour, they should defeat this noble effort to promote the glory of God, and to exalt the Spanish name above that of every other nation. Even with seditious sailors, the words of a man whom they had been accustomed to reverence were weighty and persuasive; and not only restrained them from those violent excesses which they meditated, but prevailed with them to accompany their admiral for some time longer.

As they proceeded, the indications of approaching land seemed to be more certain, and excited hope in proportion. The birds began to appear in flocks, making towards the south-west. Columbus, in imitation of the Portuguese navigators, who had been guided in several of their discoveries by the motion of birds, altered his course from due west towards that quarter whither they pointed their flight. But after holding on for several days in this new direction without any better success than formerly, having seen no object during 30 days but the sea and the sky, the hopes of his companions subsided faster than they had risen; their fears revived with additional force; impatience, rage, and despair, appeared in every countenance. All sense of subordination was lost. The officers, who had hitherto concurred with Columbus in opinion, and supported his authority, now took part with the private men: they assembled tumultuously on the deck, expostulated with their commander, mingled threats with their expostulations, and required him instantly to tack about and to return to Europe. Columbus perceived that it would be of no avail to have recourse to any of his former arts, which having been tried so often had lost their effect; and that it was impossible to rekindle any zeal for the success of the expedition among men in whose breasts fear had extinguished every generous sentiment. He saw that it was no less vain to think of employing either gentle or severe measures, to quell a mutiny so general and so violent. It was necessary, on all these accounts, to soothe the passions which he could no longer command, and to give way to a torrent too impetuous to be checked. He promised solemnly to his men that he would comply with their request, provided they would accompany him, and obey his commands for three days longer; and if, during that time, land were not discovered, he would then abandon the enterprise, and direct his course towards Spain.

122
His crews ready to mutiny.

Enraged as the sailors were, and impatient to turn their faces again towards their native country, this proposition did not appear to them unreasonable. Nor did Columbus hazard much in confining himself to a term so short. The presages of discovering land were now so numerous and promising, that he deemed them infallible. For some days the sounding line reached the bottom, and the soil which it brought up indicated land to be at no great distance. The flocks of birds increased; and were composed not only of sea fowl, but of such land birds as could not be supposed to fly far from the shore. The crew of the Pinta observed a cane floating which seemed to be newly cut, and likewise a piece of timber artificially carved. The sailors aboard the Nigna took up the branch of a tree with red berries perfectly fresh. The clouds around the setting sun assumed a new appearance; the air was more

America. more mild and warm; and, during night, the wind became unequal and variable. From all these symptoms, Columbus was so confident of being near land, that on the evening of the 11th of October, after public prayers for success, he ordered the sails to be furled, and the ships to lie by, keeping strict watch, lest they should be driven ashore in the night. During this interval of suspense and expectation, no man shut his eyes, all kept upon deck, gazing intently towards that quarter where they expected to discover the land which had been so long the object of their wishes.

123
Their joy on descri-
ing coast.

About two hours before midnight, Columbus standing on the forecable, observed a light at a distance, and privately pointed it out to Pedro Gutierrez, a page of the queens wardrobe. Gutierrez perceived it; and calling to Salcedo comptroller of the fleet, all three saw it in motion, as if it were carried from place to place. A little after midnight, the joyful sound of *Land! land!* was heard from the Pinta, which kept always a-head of the other ships. But having been so often deceived by fallacious appearances, every man was now become slow of belief; and waited, in all the anguish of uncertainty and impatience, for the return of day. As soon as morning dawned, all doubts and fears were dispelled. From every ship an island was seen about two leagues to the north, whose flat and verdant fields, well stored with wood, and watered with many rivulets, presented the aspect of a delightful country. The crew of the Pinta instantly began the *Te Deum*, as a hymn of thanksgiving to God; and were joined by those of the other ships, with tears of joy and transports of congratulation. This office of gratitude to Heaven was followed by an act of justice to their commander. They threw themselves at the feet of Columbus, with feelings of self-condemnation mingled with reverence. They implored him to pardon their ignorance, incredulity, and insolence, which had created him so much unnecessary disquiet, and had so often obstructed the prosecution of his well-concerted plan; and passing, in the warmth of their admiration, from one extreme to another, they now pronounced the man whom they had so lately reviled and threatened, to be a person inspired by Heaven with sagacity and fortitude more than human, in order to accomplish a design so far beyond the ideas and conception of all former ages.

124
They land
in one of
the islands
of the New
World.

As soon as the sun arose, all their boats were manned and armed. They rowed towards the island with their colours displayed, with warlike music, and other martial pomp. As they approached the coast, they saw it covered with a multitude of people, whom the novelty of the spectacle had drawn together, whose attitudes and gestures expressed wonder and astonishment at the strange objects which presented themselves to their view. Columbus was the first European who set foot in the New World which he had discovered. He landed in a rich dress, and with a naked sword in his hand. His men followed; and, kneeling down, they all kissed the ground which they had so long desired to see. They next erected a crucifix; and, prostrating themselves before it, returned thanks to God for conducting their voyage to such an happy issue.

The above was one of the Bahama islands; to which he gave the name of *San Salvador*, and took possession of it in the name of their Catholic majesties. In this

first voyage he discovered several other of the Lucayo or Bahama islands, with those of Cuba and Hispaniola. The natives considered the Spaniards as divinities, and the discharge of the artillery as their thunder: they fell prostrate at the sound. The women, however, offered their favours, and courted the embraces of their new guests as men. Their husbands were not jealous of them; and in the arms of those wantons the companions of Columbus are said to have caught that malady which directs its poison to the springs of life. In a second voyage many new islands were discovered. In a third, he attained the great object of his ambition, by discovering the continent of America, near the mouth of the river Oroonoko, on the first day of August 1498. His success produced a crowd of adventurers from all nations; but the year before this, the northern continent had been discovered by Sebastian Cabot in the service of Henry VII. of England.

America.
125
The conti-
nent after-
wards dis-
covered.

Notwithstanding the many settlements of the Europeans in this continent, great part of America remains still unknown. The northern continent contains the British colonies of Hudson's Bay, Canada, Nova Scotia, New England, New York, New Jersey, Pennsylvania, Maryland, Virginia, North and South Carolina, Georgia, East and West Florida. It contains also the Spanish territories of Louisiana, New Mexico, California, and Mexico. Besides these, there are immense regions to the west and north, the boundaries of which have never yet been discovered. In such as are in any degree known, dwell the Esquimaux, the Algonquins, the Hurons, the Iroquois, the Cherokees, the Chickasaws, and many other tribes of Indians. In the southern continent lie the Spanish provinces of Terra Firma, Guiana, Peru, Paraguay, and Chili; together with that of Brazil, belonging to the Portuguese; and the country of Surinam, belonging to the Dutch. Vast tracts, however, in the inland parts, are unknown, being comprehended under the general name of *Amazonia*. A large district also, said to be the residence of a gigantic race of men, lies on the east side of the continent, between the straits of Magellan and the province of Paraguay. See P A T A G O N I A.

126
Division of
America.

This vast country produces most of the metals, minerals, plants, fruits, trees, and wood, to be met with in the other parts of the world, and many of them in greater quantities and high perfection. The gold and silver of America have supplied Europe with such immense quantities of those valuable metals, that they are become vastly more common; so that the gold and silver of Europe now bears little proportion to the high price set upon them before the discovery of America.

127
Its produc-
tions.

It also produces diamonds, pearls, emeralds, amethysts, and other valuable stones, which, by being brought into Europe, have contributed likewise to lower their value. To these, which are chiefly the production of Spanish America, may be added a great number of other commodities, which, though of less price, are of much greater use; and many of them make the ornament and wealth of the British empire in this part of the world. Of these are the plentiful supplies of cochineal, indigo, anatto, logwood, brazil, fustic, pimento, lignum vitæ, rice, ginger, cocoa, or the chocolate nut, sugar, cotton, tobacco, banillas, red-wood, the balsams of Tolu, Peru, and Chili, that valuable

America.

valuable article in medicine the Jesuit's bark, mechoacan, sassaparilla, cassia, tamarinds, hides, furs, ambergrise, and a great variety of woods, roots, and plants; to which, before the discovery of America, we were either entire strangers, or forced to buy at an extravagant rate from Asia and Africa, through the hands of the Venetians and Genoese, who then engrossed the trade of the eastern world.

On this continent there grows also a variety of excellent fruits; as pine-apples, pomegranates, citrons, lemons, oranges, malicacions, cherries, pears, apples, figs, grapes, great numbers of culinary, medicinal, and other herbs, roots, and plants, with many exotic productions which are nourished in as great perfection as in their native soil.

128
The different possessors of America.

Although the Indians still live in the quiet possession of many large tracts, America, so far as known, is chiefly claimed, and divided into colonies, by three European nations, the Spaniards, English, and Portuguese. The Spaniards, as they first discovered it, have the largest and richest portion, extending from New Mexico and Louisiana in North America, to the Straits of Magellan in the South Sea, excepting the large province of Brasil, which belongs to Portugal; for though the French and Dutch have some forts upon Surinam and Guiana, they scarcely deserve to be considered as proprietors of any part of the southern continent.

Next to Spain, the most considerable proprietor of America was Great Britain, who derived her claim to North America from the first discovery of that continent by Sebastian Cabot in the name of Henry VII. anno 1497, about six years after the discovery of South America by Columbus in the name of the king of Spain. This country was in general called *Newfoundland*; a name which is now appropriated solely to an island upon its coast. It was a long time before we made an attempt to settle in this country. Sir Walter Raleigh, an uncommon genius and a brave commander, first showed the way, by planting a colony in the southern part, which he called *Virginia*, in honour of his mistress Queen Elizabeth.

The French indeed, from this period until the conclusion of the war before last, laid a claim to, and actually possessed, Canada and Louisiana; comprehending all that extensive inland country reaching from Hudson's Bay on the north, to Mexico and the gulph of the same name on the south. But in that war, to which their perfidy and ambition gave rise, they were not only driven from Canada and its dependencies, but obliged to relinquish all that part of Louisiana lying on the east side of the Mississippi, as related under the *History of BRITAIN*. And thus our colonies were preferred,

129
Vast extent of the British possession before the late revolution.

secured, and extended so far, as to render it difficult to ascertain the precise bounds of our empire in North America. To the northward we might have extended our claims quite to the pole itself, nor did any nation seem inclined to dispute the property of this northernmost country with us. From that extremity we had a territory extending southward to Cape Florida in the Gulph of Mexico, N. Lat 25°, and consequently near 4000 miles long in a direct line. And to the westward, our boundaries reached to nations unknown even to the Indians of Canada.

Of the revolution that has since taken place, by which a great part of those territories have been torn

from the British empire, the history follows in the next article. America.

AMERICA (United States of). Of the rise and establishment of this republic, which has given a new face to the western world, a succinct and impartial narrative shall in this article be attempted; in which, however, we cannot hope entirely to avoid errors, as they are perhaps unavoidable. The accounts from which the historian must derive his information are not yet cleared from the mistakes of prejudice and the fabrications of party; when they differ, their comparative authenticity is with difficulty ascertained; and they want above all that softening which they can receive from time alone.

The beginning of every political establishment is contemptible. Some few banditti taking refuge among the marshes on the banks of the Tiber, laid the foundation of the Roman empire. The turbulence of some North Americans, and the blunders of some British statesmen, gave birth to this new republic, which at a future period, it has been fancied, may perhaps surpass even the splendor of Rome.

The state of the British colonies at the conclusion of the war in 1763, was such as attracted the attention of all the politicians in Europe. Their flourishing condition at that period was remarkable and striking: their trade had prospered in the midst of all the difficulties and distresses of a war in which they were so nearly and so immediately concerned. Their population continued on the increase, notwithstanding the ravages and depredations that had been so fiercely carried on by the French, and the native Indians in their alliance. They abounded with spirited and active individuals of all denominations. They were flushed with the uncommon prosperity that had attended them in their commercial affairs and military transactions. Hence they were ready for all kind of undertakings, and saw no limits to their hopes and expectations.

As they entertained the highest opinion of their value and importance, and of the immense benefit that Britain derived from its connection with them, their notions were adequately high in their own favour. They deemed themselves, not without reason, intitled to every kindness and indulgence which the mother-country could bestow.

Although their pretensions did not amount to a perfect equality of advantages and privileges in matters of commerce, yet in those of government they thought themselves fully competent to the task of conducting their domestic concerns with little or no interference from abroad. Though willing to admit the supremacy of Great Britain, they viewed it with a suspicious eye, and with a marked desire and intent speedily to give it limitations.

Their improvements in all the necessary and useful arts did honour to their industry and ingenuity. Though they did not live in the luxury of Europe, they had all the solid and substantial enjoyments of life, and were not unacquainted with many of its elegancies and refinements.

A circumstance much to their praise is, that notwithstanding their peculiar addiction to those occupations of which lucre is the sole object, they were duly attentive to cultivate the field of learning; and they have ever since their first foundation been particularly careful to provide for the education of the rising progeny.

Their

130
Rise of the American republic.

131
State and character of the British colonies at the end of the war 1763.

America.

Their vast augmentation of internal trade and external commerce, was not merely owing to their position and facility of communication with other parts; it arose also from their natural turn and temper, full of schemes and projects; ever aiming at new discoveries, and continually employed in the search of means of improving their condition.

Their condition carried them into every quarter from whence profit could be derived. There was scarcely any part of the American hemisphere to which they had not extended their navigation. They were continually exploring new sources of trade, and were found in every spot where business could be transacted.

To this extensive and incessant application to commerce, they added an equal vigilance in the administration of their affairs at home. Whatever could conduce the amelioration of the soil they possessed, to the progress of agriculture, or to the improvement of their domestic circumstances, was attended to with so much labour and care, that it may be strictly said, that Nature had given them nothing of which they did not make the most.

In the midst of this solicitude and toil in matters of business, the affairs of government were conducted with a steadiness, prudence, and lenity, seldom experienced, and never exceeded, in the best regulated countries of Europe.

Such was the situation of the British colonies in general throughout North America, and of the New England provinces in particular, when the pacification above mentioned opened one of the most remarkable scenes that ever commanded the attention of the world.

132

Intrigues of the French.

The French, who have for many ages been the fiercest and natural enemies of Britain, had long viewed, with equal envy and apprehension, the flourishing state of those colonies she had founded in North America. No doubt at present subsists, that they began immediately after the peace of Paris to carry into execution the scheme they had formed for the separation of the British colonies from the mother-country.

Conscious that, whilst a good understanding lasted between them, the superiority must henceforth remain for ever on the side of Britain, it was only by their disunion that France could hope to restore the station and consequence she had formerly possessed in Europe.

The first steps she took were to employ her secret emissaries in spreading dissatisfaction among the British colonists; and the effects produced by her machinations were precisely such as they had intended and expected. The disposition of the inhabitants of North America began gradually to alter from that warmth of attachment to the mother-country which had so peculiarly characterised them. They began to view her rather in the light of a sovereign than of a parent; and to examine, with a scrupulous nicety, the nature of those ties that rendered them parts of her empire.

133

Taxes laid on goods imported into the colonies, and other obnoxious acts framed;

In March 1764, a bill was passed, by which heavy duties were laid on goods imported by the colonists from such West India islands as did not belong to Great Britain; at the same time that these duties were to be paid into the exchequer in specie: and in the same session, another bill was framed to restrain the currency of paper-money in the colonies themselves. These acts coming so close upon each other, threw the whole continent into the utmost ferment. Vehement remonstrances

were made to the ministry, and every argument made use of that reason or ingenuity could suggest, but to no purpose. Their reasoning, however, convinced a great number of people at home; and thus the American cause came to be considered as the cause of liberty.

America.

134
Which exasperate the Americans.

The Americans, finding all argumentation vain, at last united in an agreement to import no more of the manufactures of Great Britain, but to encourage to the utmost of their power every thing of that kind among themselves. Thus the British manufacturers also became a party against ministry, and did not fail to express their resentment in the strongest terms; but the ministry were not to be so easily daunted, and therefore proceeded to the last step of their intended plan, which was to lay on stamp duties throughout the continent. Previous to this, indeed, several regulations were passed in favour of the commerce of the colonies; but they had now imbibed such unfavourable sentiments of the British ministry, that they paid very little regard to any thing pretended to be done in their favour; or if these acts made any favourable impression, it was quickly obliterated by the news of the stamp-act. The reason given for this act so exceedingly obnoxious was, that a sum might be raised sufficient for the defence of the colonies against a foreign enemy; but this pretence was so far from giving any satisfaction to the Americans, that it excited their indignation to the utmost degree. They not only asserted that they were abundantly able to defend themselves against any foreign enemy, but denied that the British parliament had any right to tax them at all.

135

The stamp-act framed.

It would be superfluous to enter into any arguments used by the contending parties on this important occasion. It was evident that the matter was not to be decided by argument but by force of arms; and the British ministry, too confident of the authority and power of this country, determined to carry on matters with an high hand, to terrify the colonists into an implicit subjection, or, if that would not do, to compel them to it by force. The stamp-act, after a violent opposition in parliament, was passed, and its reception in America was such as might have been expected. The news, and the act itself, first arrived at Boston, where the bells were muffled and rung a funeral peal. The act was first hawked about the streets with a Death's head affixed to it, and styled the "Folly of England, and the Ruin of America;" and afterwards publicly burnt by the enraged populace: The stamps themselves were seized and destroyed, unless brought by men of war, or kept in fortified places; those who were to receive the stamp duties were compelled to resign their offices; and such of the Americans as sided with government on this occasion, had their houses plundered and burnt.

136

Received with universal indignation in America.

Though these outrages were committed by the lowest of the multitude, they were first connived at by those of superior rank, and the principles on which they were founded afterwards openly patronized by them; and the doctrine became general and openly avowed, that Britain had no right whatever to tax the colonies without their own consent.

It was now found absolutely necessary either to yield to the Americans, by repealing the obnoxious statutes, or to enforce them by arms. The ferment had diffused

itself.

America. itself universally throughout the colonies. Virginia first, and after that all the rest of the provinces, declared against the right of Britain to lay on taxes in America; and that every attempt to vest others with this power besides the king, or the governor of the province and his general assembly, was illegal, unconstitutional, and unjust. Non-importation agreements were every where entered into; and it was even resolved to prevent the sale of any more British goods after the present year. American manufactures, though dearer, as well as inferior in quality to the British, were universally preferred. An association was entered into against eating of lamb, in order to promote the growth of wool; and the ladies with cheerfulness agreed to renounce the use of every species of ornament manufactured in Britain. Such a general and alarming confederacy determined the ministry to repeal some of the most obnoxious statutes; and to this they were the more inclined by a petition from the first American congress, held at New York in the beginning of October 1765.

137 Repealed.

The stamp-act was therefore repealed, to the universal joy of the Americans, and indeed to the general satisfaction of the English, whose manufactures had begun to suffer very severely in consequence of the American association against them. The disputes on the subject without doors, however, were by no means silenced, but each party continued to argue the case as violently as ever. The celebrated Dr Benjamin Franklin was, on this occasion, examined before the House of Commons; and his opinion was in substance as follows:

138 Opinion of Dr Franklin on this subject.

“ That the tax in question was impracticable and ruinous. The very attempt had so far alienated the affection of the colonies, that they behaved in a less friendly manner towards the natives of England than before; considering the whole nation as conspiring against their liberty, and the parliament as willing rather to oppress than to support and assist them. America, in fact, did not stand in any need of British manufactures, having already begun to construct such as might be deemed absolutely necessary, and that with such success, as left no doubt of their arriving in a short time at perfection. The elegancies of dress had already been renounced for manufactures of the American kind, though much inferior; and the bulk of the people, consisting of farmers, were such as could in no way be affected by the want of British commodities, as having every necessary within themselves. Materials of all kinds were to be had in plenty: the wool was fine; flax grew in great abundance, and iron was every where to be met with.”

The Doctor also insisted, That “ the Americans had been greatly misrepresented; that they had been traduced as void of gratitude and affection to the parent state; than which nothing could be more contrary to truth. In the war of 1755 they had, at their own expense, raised an army of 25,000 men; and in that of 1739, they assisted the British expeditions against South America with several thousand men, and had made many brave exertions against the French in North America. It was said that the war of 1755 had been undertaken in defence of the colonies; but the truth was, that it originated from a contest about the limits between Canada and Nova Scotia, and in defence of the English rights to trade on the Ohio. The Ame-

N^o 15.

America. rians, however, would still continue to act with their usual fidelity; and, were any war to break out in which they had no concern, would show themselves as ready as ever to assist the parent state to the utmost of their power, and would never fail to manifest their readiness in contributing to the emergencies of government, when called to do so in a regular and constitutional manner.”

The ministry were conscious, that in repealing this obnoxious act, they yielded to the Americans; and therefore, to support, as they thought, the dignity of Great Britain, it was judged proper to publish a declaratory bill, setting forth the authority of the mother country over her colonies, and her power to bind them by laws and statutes *in all cases whatever*. This much diminished the joy with which the repeal of the stamp-act was received in America. It was considered as a proper reason to enforce any claims equally prejudicial with the stamp-act, which might hereafter be set up; a spirit of jealousy pervaded the whole continent, and a strong party was formed, watchful on every occasion to guard against the supposed encroachments of the British power.

139 Declaratory bill given offence in America.

It was not long before an occasion offered, in which the Americans manifested a spirit of absolute independence; and that, instead of being bound by the British legislature in all cases, they would not be controlled by it in the most trivial affairs. The Rockingham ministry had passed an act, providing the troops stationed in different parts of the colonies with such accommodations as were necessary for them. The assembly of New York, however, took upon them to alter the mode of execution prescribed by the act of parliament, and to substitute one of their own. This gave very great offence to the new ministry, and rendered them, though composed of those who had been active against the stamp-bill, less favourable to the colonies than in all probability they would have otherwise been. An unlucky circumstance at the same time occurred, which threw every thing once more into confusion. One of the new ministry, Mr Charles Townshend, having declared that he could find a way of taxing the Americans without giving them offence, was called upon to propose his plan. This was by imposing a duty upon tea, paper, painters colours, and glass imported into America. The undutiful behaviour of the New York assembly, and that of Boston, which had proceeded in a similar manner, caused this bill to meet with less opposition than otherwise it might have done. As a punishment to the refractory assemblies, the legislative power was taken from that of New-York, until it should fully comply with the terms of the act. That of Boston at last submitted with reluctance. The bill for the new taxes was quickly passed, and sent to America in 1768.

140 Assembly of New York disobeys an act of parliament.

141 Mr Townshend's plan to tax America,

A ferment much greater than that occasioned by the stamp-act now took place throughout the continent. The populace renewed their outrages, and those of superior station entered into regular combinations against it. Circular letters were sent from Massachusetts's colony to all the rest, setting forth the injustice and impropriety of the behaviour of the British legislature. Meetings were held in all the principal towns, in which it was proposed to lessen the consumption of foreign manufactures, by giving proper encouragement to their own.

142 Is received there with still greater indignation than even the stamp-act.

America. own. Continual disputes ensued betwixt the govern-
 143 Quarell between the people of Maffachufet's Bay and their governor. nors and general assemblies of their provinces, which were
 much heightened by a letter from Lord Shelburn to
 governor Bamand of Maffachufet's bay, containing
 complaints of the people he governed. The assembly,
 exasperated to the higheft degree, charged their governor
 with having misrepresented them to the court of
 Britain, required him to produce copies of the letters
 he had fent; and, on his refusal, wrote letters to the
 English miniftry, accusing him of misrepresentation and
 partiality, complaining at the fame time most grievoufly
 of the proceedings of parliament, as utterly fubverfive
 of the liberties of America, and the rights of British
 fubjects.

The governor, at a lofs how to defend himfelf, pro-
 rogued the affembly; and, in his fpeech on the occa-
 fion, gave a loofe to his resentment, accusing the mem-
 bers of ambitious defigns, incompatible with thofe of
 dutiful and loyal fubjects. To counteract the circular
 letter of the province of Maffachufet's Bay, Lord
 Hillsborough, fecretary for the American department,
 fent another to the governors of the different colonies,
 reprobating the other as full of misrepresentation, and
 tending to excite a rebellion againft the authority of
 the parent ftate.

Matters now haftened to a crisis. The governor had
 been ordered to proceed with vigour, and by no means
 144 He requires the affembly to re- fcind their circular letter; to fhow any difpofition to yield to the people as for-
 merly. In particular, they were required to reſcind
 that reſolution by which they had written the circular
 letter above mentioned; and, in caſe of a refusal, it
 was told them that they would be diſſolved. As this
 letter had been framed by the reſolutions of a former
 Houſe, they deſired, after a week's confultation, that
 a recess might be granted to confult with their conſti-
 tuents; but this being refuſed, they came to a determina-
 145 Which they reſuſe. tion, 92 againſt 17, to adhere to the reſolution which
 produced the circular letter. At the ſame time a let-
 ter was ſent to Lord Hillsborough, and a meſſage to
 the governor, in juſtification of their proceedings. In
 both, they expreſſed themſelves with ſuch freedom as
 was by no means calculated to accord with the ſenti-
 ments of thoſe in power. They inſiſted that they had
 a right to communicate their ſentiments to their fellow-
 ſubjects upon matters of ſuch importance; complained
 of the requiſition to reſcind the circular letter as un-
 conſtitutional and unjuſt; and particularly inſiſted, that
 they were repreſented as harbouring ſeditious deſigns,
 when they were doing nothing but what was lawful
 and right. At the ſame time, they condemned the
 late acts of parliament as highly oppreſſive, and ſub-
 verſive of liberty. The whole was concluded by a liſt
 of accuſations againſt their governor, repreſenting him
 as unfit to continue in his ſtation, and petitioning the
 king for his removal from it.

146 Accuſe their gover- nor, and pe- tion for his remo- val. Theſe proceedings were followed by a violent tumult
 at Boſton. A veſſel belonging to a capital trader had
 been ſeized in conſequence of his having neglected ſome
 of the new regulations; and being taken under the pro-
 tection of a man of war at that time lying in the har-
 bour, the populace attacked the houſes of the com-
 miſſioners of exciſe, broke their windows, deſtroyed
 the collector's boats, and obliged the cuſtomhouſe-offi-
 cers to take refuge in Caſtle William, ſituated at the
 entrance of the harbour.

147 A tumult at Boſton. Theſe proceedings were followed by a violent tumult
 at Boſton. A veſſel belonging to a capital trader had
 been ſeized in conſequence of his having neglected ſome
 of the new regulations; and being taken under the pro-
 tection of a man of war at that time lying in the har-
 bour, the populace attacked the houſes of the com-
 miſſioners of exciſe, broke their windows, deſtroyed
 the collector's boats, and obliged the cuſtomhouſe-offi-
 cers to take refuge in Caſtle William, ſituated at the
 entrance of the harbour.

The governor now took the laſt ſtep in his power to
 put a ſtop to the violent proceedings of his aſſembly,
 by diſſolving it entirely; but this was of little moment.
 148 The aſſem- bly diſſol- ved. Their behaviour had been highly approved by the other
 colonies, who had written letters to them expreſſive of
 their approbation. After the diſſolution of the aſſem-
 bly, frequent meetings of the people were held in Boſ-
 ton, which ended in a remonſtrance to the governor,
 to the ſame purpoſe as ſome of the former; but con-
 cluding with an extraordinary requeſt, that he would
 take upon him to order the king's ſhips out of the
 harbour.

149 The diſtur- bances ſtill increaſe. While the diſpoſition of the Boſtonians was thus
 going on from bad to worſe, news arrived that the
 agent for the colony had not been allowed to deliver
 their petition to the king; it having been objected,
 that the aſſembly without the governor was not ſuffi-
 cient authority. This did not contribute to allay the
 ferment; and it was further augmented by the news
 150 Some troops ordered to Boſton. that a number of troops had been ordered to repair to
 Boſton, to keep the inhabitants in awe.

A dreadful alarm now took place. The people cal-
 led on the governor to convene a general aſſembly, in
 order to remove their fears of the military; who they
 ſaid were to be aſſembled to overthrow their liberties,
 and force obedience to laws to which they were entire-
 ly averſe. The governor replied, that it was no long-
 er in his power to call an aſſembly; having, in his laſt
 inſtructions from England, been required to wait the
 king's orders, the matter being then under conſidera-
 tion at home. Being thus refuſed, the people took
 upon themſelves the formation of an aſſembly, which
 they called a *convention*. The proceedings and reſo-
 151 The people form an aſ- ſembly, call- ed a Con- vention; lutions of this were conformable to their former be-
 haviour; but now they went a ſtep farther, and, un-
 der pretence of an approaching rupture with France,
 ordered the inhabitants to put themſelves in a poſture
 of defence againſt any ſudden attack of an enemy; and
 circular letters were directed to all the towns in the
 province, acquainting them with the reſolutions that
 had been taken in the capital, and exhorting them to
 proceed in the ſame manner. The town of Hatfield
 alone refuſed its concurrence; but this ſerved only to
 expoſe them to the cenſure and contempt of the reſt.
 The convention, however, thought proper to aſſure
 the governor of their pacific intentions, and renewed
 their requeſt that an aſſembly might be called; but
 being refuſed any audience, and threatened with be-
 ing treated as rebels, they at laſt thought proper to
 diſſolve of themſelves, and ſent over to Britain a cir-
 152 Which diſ- ſolves, and endeavours to vindicate itſown con- duct. cumſtantial account of their proceedings, with the
 reaſon of their having aſſembled in the manner already
 mentioned.

The expected troops arrived on the very day on
 which the convention broke up, and had ſome houſes
 in the town fitted up for their reception. Their ar-
 rival had a conſiderable influence on the people, and for
 ſome time ſeemed to put a ſtop to the diſturbances; but
 the ſeeds of diſcord had now taken ſuch deep root, that
 it was impoſſible to quench the flame. The late out-
 rageous behaviour in Boſton had given the greateſt of-
 fence in England; and, notwithstanding all the efforts
 153 Both houſes of parlia- ment ad- dreſs the king againſt was America. of oppoſition, an addreſs from both houſes of parlia-
 ment was preſented to the king; in which the auda-
 cious behaviour of the colony of Maffachufet's Bay
 was againſt the king.

America.

was set forth in the most ample manner, and the most vigorous measures recommended for reducing them to obedience. The Americans, however, continued steadfast in the ideas they had adopted. Though the troops had for some time quieted the disturbances, yet the calm continued no longer than they appeared respectable on account of their number; but as soon as this was diminished by the departure of a large detachment, the remainder were treated with contempt, and it was even resolved to expel them altogether. The country people took up arms for this purpose, and were to have assisted their friends in Boston; but before the plot could be put in execution, an event happened which put an end to every idea of reconciliation betwixt the contending parties.

154

Some people killed by the soldiers in a mob at Boston.

On the 5th of March 1770, a scuffle happened between some soldiers and a party of the town's people. The inhabitants poured in from all quarters to the assistance of their fellow-citizens; a violent tumult ensued, during which the military fired among the mob, killing and wounding several of them. The whole province now rose in arms, and the soldiers were obliged to retire to Castle William to prevent their being cut in pieces. In other respects the determinations of the Americans continued, if possible, more firm than ever, until at last government, determined to act with vigour, and at the same time to behave with as much condescension as possible, repealed all the duties lately laid on, that of tea alone excepted. This was left on purpose to maintain the dignity of the crown of Britain; and it was thought that it could not be productive of any discontent in America, as being an affair of very little moment, the produce of which was not expected to exceed L. 16,000. The opposition, however, were strenuous in their endeavours to get this tax likewise abrogated; insisting, that the Americans would consider it only as an inlet to others; and that the repeal of all the rest, without this, would answer no good purpose. The event showed that their opinion was well founded. The Americans opposed the tea-tax with the same violence as they had done all the rest: and at last, on the news that salaries had been settled on the justices of the superior court of Boston, the governor was addressed on the subject; the measure was condemned in the strongest terms; and a committee selected out of the several districts of the colony appointed to inquire into it.

156

Which is as violently opposed as all the rest.

The new assembly proceeded in the most formal manner to disavow the supremacy of the British legislature; accused the parliament of Britain of having violated the natural rights of the Americans in a number of instances. Copies of the transactions of this assembly were transmitted to every town in Massachusetts, exhorting the inhabitants to rouse themselves, and exert every nerve in opposition to the iron hand of oppression, which was daily tearing the choicest fruits from the fair tree of liberty. The disturbances were also greatly heightened by an accidental discovery that Mr. Hutchinson, governor of Massachusetts Bay, had written several confidential letters to people in power in England, complaining of the behaviour of the province, recommending vigorous measures against them, and, among other things, asserting, that "there must be an abridgment of what is called British liberty." Letters of this kind had some how or other fallen in-

158

Gov. Hutchinson's letters to British ministry discovered.

to the hands of the agent for the colony at London. They were immediately transmitted to Boston, where the assembly was sitting, by whom they were laid before the governor, who was thus reduced to a very mortifying situation. Losing every idea of respect or friendship for him as their governor, they instantly dispatched a petition to the king, requesting him to remove the governor and deputy-governor from their places; but to this they not only received no favourable answer, but the petition itself was declared groundless and scandalous.

America.

159 The petition against him refused.

Matters were now ripe for the utmost extremities on the part of the Americans; and they were brought on in the following manner. Though the colonists had entered into a non-importation agreement against tea as well as all other commodities from Britain, it had nevertheless found its way into America, though in smaller quantities than before. This was sensibly felt by the East-India Company, who had now agreed to pay a large sum annually to government; in recompence for which compliance, and to make up their losses in other respects, they were empowered to export their tea from any duty payable in Britain; and in consequence of this permission, several ships freighted with the commodity were sent to North America, and proper agents appointed for disposing of it. The Americans now perceiving that the tax was thus likely to be enforced whether they would or not, determined to take every possible method to prevent the tea from being landed, as well knowing that it would be impossible to hinder the sale should the commodity once be brought on shore. For this purpose the people assembled in great numbers, forcing those to whom the tea was consigned to resign their offices, and to promise solemnly never to resume them; and committees were appointed to examine the accounts of merchants, and make public tests, declaring such as would not take them enemies to their country. Nor was this behaviour confined to the colony of Massachusetts Bay; the rest of the provinces entered into the contest with the same warmth, and manifested the same resolution to oppose the mother country.

160 Tea destroyed at Boston.

In the midst of this confusion three ships laden with tea arrived at Boston; but so much were the captains alarmed at the disposition which seemed to prevail among the people, that they offered, providing they could obtain the proper discharges from the tea-consignees, customhouse, and governor, to return to Britain without landing their cargoes. The parties concerned, however, though they durst not order the tea to be landed, refused to grant the discharges required. The ships, therefore, would have been obliged to remain in the harbour; but the people, apprehensive that if they remained there the tea would be landed in small quantities and disposed of in spite of every endeavour to prevent it, resolved to destroy it at once. This resolution was executed with equal speed and ferocity. The very evening after the above-mentioned discharges had been refused, a number of people dressed like Mohawk Indians boarded the ships, and threw into the sea their whole cargoes, consisting of 342 chests of tea; after which they retired without making any further disturbance, or doing any more damage. No tea was destroyed in other places, though the same spirit was every where manifested. At Philadelphia the

¹⁶¹ America. the pilots were enjoined not to conduct the vessels up the river; and at New York, though the governor caused some tea to be landed under the protection of a man of war, he was obliged to deliver it up to the custody of the people, to prevent its being sold.

The destruction of the tea at Boston, which happened in November 1773, was the immediate prelude to the disasters attending civil discord. Government finding themselves every where insulted and despised, resolved to enforce their authority by all possible means; and as Boston had been the principal scene of the riots and outrages, it was determined to punish that city in an exemplary manner. Parliament was acquainted by a message from his majesty with the undutiful behaviour of the city of Boston, as well as of all the colonies, recommending at the same time the most vigorous and spirited exertions to reduce them to obedience. The parliament in its address promised a ready compliance; and indeed the Americans, by their outrageous behaviour, had now lost many of their partisans.

¹⁶² Punishment of Boston resolved on. It was proposed to lay a fine on the town of Boston equal to the price of the tea which had been destroyed, and to shut up its port by armed vessels until the refractory spirit of the inhabitants should be subdued; which it was thought must quickly yield, as a total stop would thus be put to their trade. The bill was strongly opposed on the same grounds that the other had been; and it was predicted, that instead of having any tendency to reconcile or subdue the Americans, it would infallibly exasperate them beyond any possibility of reconciliation. The petitions against it, presented by the colony's agent, pointed out the same consequence in the strongest terms, and in the most positive manner declared that the Americans never would submit to it; but such was the infatuation attending every rank and degree of men, that it never was imagined the Americans would dare to resist the parent state openly, but would in the end submit implicitly to her commands.

¹⁶⁴ And for the impartial administration of justice. In this confidence a third bill was proposed for the impartial administration of justice on such persons as might be employed in the suppression of riots and tumults in the province of Massachusetts Bay. By this act it was provided, that should any persons acting in that capacity be indicted for murder, and not able to obtain a fair trial in the province, they might be sent by the governor to England, or to some other colony, if necessary, to be tried for the supposed crime.

¹⁶⁵ Quebec bill. These three bills having passed so easily, the ministry proposed a fourth, relative to the government of Canada; which, it was said, had not yet been settled on any proper plan. By this bill the extent of that province was greatly enlarged; its affairs were put under the direction of a council in which Roman Catholics were to be admitted; the Roman Catholic clergy were secured in their possessions and the usual perquisites from those of their own profession. The council above mentioned were to be appointed by the crown; to be removable at its pleasure; and to be invested with every legislative power excepting that of taxation.

¹⁶⁶ These acts exasperate the Americans. No sooner were these laws made known in America, than they cemented the union of the colonies almost beyond any possibility of dissolving it. The assembly of Massachusetts Bay had passed a vote against the

judges accepting salaries from the crown, and put the question, Whether they would accept them as usual from the general assembly? Four answered in the affirmative; but Peter Oliver the chief-justice refused. A petition against him, and an accusation, were brought before the governor; but the latter refused the accusation, and declined to interfere in the matter; but as they still insisted for what they called justice against Mr Oliver, the governor thought proper to put an end to the matter by dissolving the assembly.

In this situation of affairs a new alarm was occasioned by the news of the port-bill. This had been totally unexpected, and was received with the most extravagant expressions of displeasure among the populace; and while these continued, the new governor, General Gage, arrived from England. He had been chosen to this office on account of his being well acquainted in America, and generally agreeable to the people; but human wisdom could not now point out a method by which the flame could be allayed. The first act of his office as governor was to remove the assembly to Salem, a town 17 miles distant, in consequence of the late act. When this was intimated to the assembly, they replied by requesting him to appoint a day of public humiliation for deprecating the wrath of heaven, but met with a refusal. When met at Salem, they passed a resolution, declaring the necessity of a general congress composed of delegates from all the provinces, in order to take the affairs of the colonies at large into consideration; and five gentlemen, remarkable for their opposition to the British measures, were chosen to represent that of Massachusetts Bay. They then proceeded with all expedition to draw up a declaration, containing a detail of the grievances they laboured under, and the necessity of exerting themselves against lawless power; they set forth the disregard shown to their petitions, and the attempts of Great Britain to destroy their ancient constitution; and concluded with exhorting the inhabitants of the colony to obstruct, by every method in their power, such evil designs, recommending at the same time a total renunciation of every thing imported from Great Britain till a redress of grievances could be procured.

Intelligence of this declaration was carried to the governor on the very day that it was completed; on which he dissolved the assembly. This was followed by an address from the inhabitants of Salem in favour of those of Boston, and concluding with these remarkable words: "By shutting up the port of Boston, some imagine that the course of trade might be turned hither, and to our benefit; but nature, in the formation of our harbour, forbids our becoming rivals in commerce with that convenient mart; and were it otherwise, we must be dead to every idea of justice, lost to all feelings of humanity, could we indulge one thought to seize on wealth, and raise our fortunes on the ruin of our suffering neighbours."

It had been fondly hoped by the ministerial party at home, that the advantages which other towns of the colony might derive from the annihilation of the trade of Boston, would make them readily acquiesce in the measure of shutting up that port, and rather rejoice in it than otherwise; but the words of the address above mentioned seemed to preclude all hope of this kind;

America.

¹⁶⁷ Resentment occasioned by the port-bill.

¹⁶⁹ Generosity of the people of Salem to those of Boston.

America. kind ; and subsequent transactions soon manifested it to be totally vain. No sooner did intelligence arrive of the remaining bills passed in the session of 1774, than the cause of Boston became the cause of all the colonies. The port-bill had already occasioned violent commotions throughout them all. It had been reprobated in provincial meetings, and resistance even to the last had been recommended against such oppression. In Virginia, the first of June, the day on which the port of Boston was to be shut up, was held as a day of humiliation, and a public intercession in favour of America was enjoined. The style of the prayer enjoined at this time was, that "God would give the people one heart and one mind, firmly to oppose every invasion of the American rights." The Virginians, however, did not content themselves with acts of religion. They recommended in the strongest manner a general congress of all the colonies, as fully persuaded that an attempt to tax any colony in an arbitrary manner was in reality an attack upon them all, and must ultimately end in the ruin of them all.

170
The cause of Boston espoused by all the rest of the colonies.

171
The Americans firmly united in their opposition to Britain.

172
Solemn league and covenant formed at Boston.

173
The governor attempts in vain to counteract it by proclamation.

The provinces of New York and Pennsylvania, however, were less sanguine than the rest, being so closely connected in the way of trade with Great Britain, that the giving it up entirely appeared a matter of the most serious magnitude, and not to be thought of but after every other method had failed. The intelligence of the remaining bills respecting Boston, however, spread a fresh alarm throughout the continent, and fixed those who had seemed to be the most wavering. The proposal of giving up all commercial intercourse with Britain was again proposed; contributions for the inhabitants of Boston were raised in every quarter; and they every day received addresses commending them for the heroic courage with which they sustained their calamity.

The Bostonians on their part were not wanting in their endeavours to promote the general cause. An agreement was framed, which, in imitation of former times, they called a Solemn League and Covenant. By this the subscribers most religiously bound themselves to break off all communication with Britain after the expiration of the month of August ensuing, until the obnoxious acts were repealed; at the same time they engaged neither to purchase nor use any goods imported after that time, and to renounce all connection with those who did, or who refused to subscribe to this covenant; threatening to publish the names of the refractory, which at this time was a punishment by no means to be despised. Agreements of a similar kind were almost instantaneously entered into throughout all America. General Gage indeed attempted to counteract the covenant by a proclamation, wherein it was declared an illegal and traitorous combination, threatening with the pains of law such as subscribed or countenanced it. But matters were too far gone for his proclamations to have any effect. The Americans retorted the charge of illegality on his own proclamation, and insisted that the law allowed subjects to meet in order to consider of their grievances, and associate for relief from oppression.

Preparations were now made for holding the general congress so often proposed. Philadelphia, as being the most central and considerable town, was pitched

ed upon for the place of its meeting. The delegates of whom it was to be composed were chosen by the representatives of each province, and were in number from two to seven for each colony, though no province had more than one vote. The first congress which met at Philadelphia, in the beginning of September 1774, consisted of 51 delegates. The novelty and importance of the meeting excited an universal attention; and their transactions were such as could not but tend to render them respectable.

America.
174
Congress meets at Philadelphia.

The first act of congress was an approbation of the conduct of Massachusetts Bay, and an exhortation to continue in the same spirit with which they had begun. Supplies for the suffering inhabitants (whom indeed the operation of the port-bill had reduced to great distress) were strongly recommended; and it was declared, that in case of attempts to enforce the obnoxious acts by arms, all America should join to assist the town of Boston; and should the inhabitants be obliged, during the course of hostilities, to remove further up the country, the losses they might sustain should be repaired at the public expence.

175
Account of its transactions.

They next addressed General Gage by letter; in which, having stated the grievances of the people of Massachusetts colony, they informed him of the fixed and unalterable determination of all the other provinces to support their brethren and to oppose the British acts of parliament; that they themselves were appointed to watch over the liberties of America; and intreated him to desist from military operations, lest such hostilities might be brought on as would frustrate all hopes of reconciliation with the parent state.

The next step was to publish a declaration of their rights. These they summed up in the rights belonging to Englishmen; and particularly insisted, that as their distance rendered it impossible for them to be represented in the British parliament, their provincial assemblies, with the governor appointed by the king, constituted the only legislative power within each province. They would, however, consent to such acts of parliament as were evidently calculated merely for the regulation of commerce, and securing to the parent state the benefits of the American trade; but would never allow that they could impose any tax on the colonies, for the purpose of raising a revenue, without their consent. They proceeded to reprobate the intention of each of the new acts of parliament; and insisted on all the rights they had enumerated as being unalienable, and what none could deprive them of. The Canada act they particularly pointed out as being extremely inimical to the colonies, by whose assistance it had been conquered; and they termed it "An act for establishing the Roman Catholic religion in Canada, abolishing the equitable system of English laws, and establishing a tyranny there." They further declared in favour of a non-importation and non-consumption of British goods until the acts were repealed by which duties were imposed upon tea, coffee, wine, sugar, and molasses, imported into America, as well as the Boston port-act, and the three others passed in the preceding session of parliament. The new regulations against the importation and consumption of British commodities were then drawn up with great solemnity; and they concluded with returning the warmest

America. est thanks to those members of parliament who had with so much zeal, though without any success, opposed the obnoxious acts of parliament.

Their next proceedings were to frame a petition to the king, an address to the British nation, and another to the colonies; all of which were so much in the usual strain of American language for some time past, that it is needless to enter into any particular account of them. It is sufficient to say that they were all drawn up in a masterly manner, and ought to have impressed the people of this country with a more favourable idea of the Americans than they could at that time be induced to entertain.

All this time the disposition of the people had corresponded with the warmest wishes of congress. The first of June had been kept as a fast, not only throughout Virginia where it was first proposed, but through the whole continent. Contributions for the distressed of Boston had been raised throughout America, and people of all ranks seemed to be particularly touched with them. Even those who seemed to be most likely to derive advantages from them took no opportunity, as has been already instanced in the case of Salem. The inhabitants of Marblehead also showed a noble example of magnanimity in the present case. Though situated in the neighbourhood of Boston, and most likely to derive benefit from their distresses, they did not attempt to take any advantage, but generously offered the use of their harbour to the Bostonians, as well as their wharfs and warehouses, free of all expense. In the mean time the British forces at Boston were continually increasing in number, which greatly augmented the general jealousy and disaffection; the country were ready to rise at a moment's warning; and the experiment was made by giving a false alarm that the communication between the town and country was to be cut off, in order to reduce the former by famine to a compliance with the acts of parliament. On this intelligence the country people assembled in great numbers, and could not be satisfied till they had sent messengers into the city to inquire into the truth of the report. These messengers were enjoined to inform the town's people, that if they should be so pusillanimous as to make a surrender of their liberties, the province would not think itself bound by such examples; and that Britain, by breaking their original charter, had annulled the contract subsisting between them, and left them to act as they thought proper.

The people in every other respect manifested their inflexible determination to adhere to the plan they had so long followed. The new counsellors and judges were obliged to resign their offices, in order to preserve their lives and properties from the fury of the multitude. In some places they shut up the avenues to the court-houses; and when required to make way for the judges, replied, that they knew of none but such as were appointed by the ancient usage and custom of the province. Every where they manifested the most ardent desire of learning the art of war; and every individual who could bear arms, was most assiduous in procuring them, and learning their exercise.

178 Gen. Gage fortifies Boston Neck, Matters at last proceeded to such an height, that General Gage thought proper to fortify the neck of land which joins the town of Boston to the continent. This, though undoubtedly a prudent measure in his

situation, was exclaimed against by the Americans in the most vehement manner; but the General, instead of giving ear to their remonstrances, deprived them of all power of acting against himself, by seizing the provincial powder, ammunition, and military stores at Cambridge and Charlestown. This excited such indignation, that it was with the utmost difficulty the people could be refrained from marching to Boston and attacking the troops. Even in the town itself, the company of cadets that used to attend him disbanded themselves, and returned the standard he had as usual presented them with on his accession to the government. This was occasioned by his having deprived the celebrated John Hancock, afterwards president of the congress, of his commission as colonel of the cadets. A similar instance happened of a provincial colonel having accepted a seat in the new council; upon which 24 officers of his regiment resigned their commissions in one day.

In the mean time a meeting was held of the principal inhabitants of the towns adjacent to Boston. The purport of this was publicly to renounce all obedience to the late acts of parliament, and to form an engagement to indemnify such as should be prosecuted on that account; the members of the new council were declared violators of the rights of their country; all ranks and degrees were exhorted to learn the use of arms; and the receivers of the public revenue were ordered not to deliver it into the treasury, but retain it in their own hands till the constitution should be restored, or a provincial congress dispose of it otherwise.

A remonstrance against the fortifications on Boston Neck was next prepared; in which, however, they still pretended their unwillingness to proceed to any hostile measures; asserting only as usual their firm determination not to submit to the acts of parliament they had already so much complained of. The governor, to restore tranquillity, if possible, called a general assembly; but so many of the council had resigned their seats, that he was induced to countermand its sitting by proclamation. This measure, however, was deemed illegal; the assembly met at Salem; and after waiting a day for the governor, voted themselves into a provincial congress, of which Mr Hancock was chosen president. A committee was instantly appointed, who waited on the governor with a remonstrance concerning the fortifications on Boston Neck; but nothing of consequence took place, both parties mutually criminating each other. The winter was now coming on, and the governor, to avoid quartering the soldiers upon the inhabitants, proposed to erect barracks for them; but the select men of Boston compelled the workmen to desist. Carpenters were sent for to New York, but they were refused; and it was with the utmost difficulty that he could procure winter-lodgings for his troops. Nor was the difficulty less in procuring clothes; as the merchants of New York told him, that "they would never supply any article for the benefit of men sent as enemies to their country."

This disposition, known to be almost universal throughout the continent, was in the highest degree satisfactory to congress. Every one saw that the ensuing spring was to be the season of commencing hostilities, and the most indefatigable diligence was used by the colonies to be well provided against such a formidable

America.

179 And seizes the military stores belonging to the province.

180 Opposition to the British parliament still increases.

181 A general assembly called and dissolved by proclamation.

176 Generosity of the inhabitants of Marblehead to Boston.

177 Extreme attachment of the country people to the Bostonians.

American. midable enemy. A list of all the fencible men in each colony was made out, and especially of those who had served in the former war; of whom they had the satisfaction to find that two-thirds were still alive and fit to bear arms. Magazines of arms were collected, and money was provided for the payment of troops. The governors in vain attempted to put a stop to these proceedings by proclamations; the fatal period was now arrived; and the more the servants of government attempted to repress the spirit of the Americans, the more violent it appeared.

184
Distress of
the inhabi-
tants of Bos-
ton.

In the mean time the inhabitants of Boston were reduced to great distress. The British troops, now distinguished by the name of the *enemy*, were absolutely in possession of it; the inhabitants were kept as prisoners, and might be made accountable for the conduct of the whole colonies; and various measures were contrived to relieve the latter from such a disagreeable situation. Sometimes it was thought expedient to remove the inhabitants altogether; but this was impracticable without the governor's consent. It was then proposed to set fire to the town at once, after valuing the houses and indemnifying the proprietors; but this being found equally impracticable, it was resolved to wait some other opportunity, as the garrison were not very numerous, and, not being supplied with necessaries by the inhabitants, might soon be obliged to leave the place. The friends of British government indeed attempted to do something in opposition to the general voice of the people; but after a few ineffectual meetings and resolutions, they were utterly silenced, and obliged to yield to the superior number of their adversaries.

185
Military
stores seized
by the A-
mericans.

Matters had now proceeded so far that every idea of reconciliation or friendship with Britain was lost. The Americans therefore, without ceremony, began to seize on the military stores and ammunition belonging to government. This first commenced at New-port in Rhode Island, where the inhabitants carried off 40 pieces of cannon appointed for the protection of the place; and on being asked the reason of this proceeding, they replied, that the people had seized them lest they should be made use of against themselves. After this the assembly met, and resolved that ammunition and warlike stores should be purchased with the public money.

New-Hampshire followed the example of Rhode-Island, and seized a small fort for the sake of the powder and military stores it contained. In Pennsylvania, however, a convention was held, which expressed an earnest desire of reconciliation with the mother-country; though, at the same time, in the strongest manner declaring, that they were resolved to take up arms in defence of their just rights, and defend to the last their opposition to the late acts of parliament; and the people were exhorted to apply themselves with the greatest assiduity to the prosecution of such manufactures as were necessary for their defence and subsistence, such as salt, salt-petre, gunpowder, steel, &c. This was the universal voice of the colonies, New-York only excepted. The assembly of that province, as yet ignorant of the fate of their last remonstrance, refused to concur with the other colonies in their determination to throw off the British yoke: their attachment, however, was very faint, and by the event it appeared that

a perseverance in the measures which the ministry had adopted was sufficient to unite them to the rest.

America.

As the disturbances had originated in the province of Massachusetts Bay, and there continued all along with the greatest violence, so this was the province where the first hostilities were formally commenced. In the beginning of February the provincial congress met at Cambridge; and as no friends to Britain could now find admittance to that assembly, the only consideration was how to make proper preparations for war. Expertness in military discipline was recommended in the strongest manner, and several military institutions enacted; among which that of the *minute-men* was one of the most remarkable. These were chosen from the most active and expert among the militia; and their business was to keep themselves in constant readiness at the call of their officers; from which perpetual vigilance they derived their title.—It was now easily seen that a slight occasion would bring on hostilities, which could not but be attended with the most violent and certain destruction to the vanquished party; for both were so much exasperated by a long course of reproaches and literary warfare, that they seemed to be filled with the utmost inveteracy against each other.

186
Massachu-
set's assem-
bly recom-
mend pre-
parations
for war.

On the 26th of February General Gage having been informed that a number of field-pieces had been brought to Salem, dispatched a party to seize them. Their road was obstructed by a river, over which was a draw-bridge. This the people had pulled up, and refused to let down: upon which the soldiers seized a boat to ferry them over; but the people cut out her bottom. Hostilities would immediately have commenced, had it not been for the interposition of a clergyman, who represented to the military on the one hand, the folly of opposing such numbers; and to the people on the other, that as the day was far spent the military could not execute their design, so that they might without any fear leave them the quiet possession of the draw-bridge. This was complied with; and the soldiers, after having remained for some time at the bridge, returned without executing their orders.

The next attempt, however, was attended with more serious consequences. General Gage, having been informed that a large quantity of ammunition and military stores had been collected at Concord, about 20 miles from Boston, and where the provincial congress was sitting, sent a detachment, under the command of Colonel Smith and Major Pitcairn, to destroy the stores, and, as was reported, to seize Messrs Hancock and Adams, the leading men of the congress. They set out before day-break, on the 19th of April, marching with the utmost silence, and securing every one they met on the road, that they might not be discovered. But notwithstanding all their care, the continual ringing of bells and firing of guns as they went along, soon gave them notice that the country was alarmed. About five in the morning they had reached Lexington, 15 miles from Boston, where the militia of the place were exercising. An officer called out to them to disperse; but some shots, it is said, being at that moment fired from a house in the neighbourhood, the military made a discharge, which killed and wounded several of the militia. The detachment then proceeded to Concord, where, having destroyed the stores, they were encountered by the Americans; and a scuffle ensued,

187
Skirmish at
Lexington.

in which several fell on both sides. The purpose of their expedition being thus accomplished, it was necessary for the king's troops to retreat, which they did through a continual fire kept upon them from Concord to Lexington. Here their ammunition was totally expended; and they would have been unavoidably cut off, had not a considerable reinforcement commanded by Lord Percy luckily met them. The Americans, however, continued their attack with great fury; and the British would still have been in the utmost danger, had it not been for two field-pieces which Lord Percy had brought with him. By these the impetuosity of the Americans was checked, and the British made good their retreat to Boston with the loss of 250 killed and wounded: that of the Americans was about 60.

By this engagement the spirits of the Americans were so raised, that they meditated nothing less than the total expulsion of the British troops from Boston. An army of 20,000 men was assembled, who formed a line of encampment from Roxbury to Mystic, through a space of about 30 miles; and here they were soon after joined by a large body of Connecticut troops, under General Putnam, an old officer of great bravery and experience. By this formidable force was the town of Boston now kept blocked up. General Gage, however, had so strongly fortified it, that the enemy, powerful as they were, durst not make an attack; while on the other hand, his force was by far too insignificant to meet such an enemy in the field. But towards the end of May, a considerable reinforcement having arrived, with Generals Howe, Burgoyne, and Clinton, he was soon enabled to attempt something of consequence; and this the boasts of the provincials, that they were besieging those who had been sent to subdue them, seemed to render necessary. Some skirmishes in the mean time happened in the islands lying off Boston harbour, in which the Americans had the advantage, and burnt an armed schooner, which her people had been obliged to abandon after she was left aground by the tide. Nothing decisive, however, took place till the 17th of June. In the neighbourhood of Charlestown, a place on the northern shore of the peninsula on which Boston stands, is an high ground called *Bunker's Hill*, which overlooks and commands the whole town of Boston. In the night of the 16th the provincials took possession of this place; and worked with such indefatigable diligence, that, to the astonishment of their enemies, they had before day-light almost completed a redoubt, with a strong entrenchment reaching half a mile eastward, as far as the river Mystic. After this they were obliged to sustain a heavy and incessant fire from the ships and floating batteries with which Charlestown Neck was surrounded; as well as the cannon that could reach the place from Boston; in spite of which, however, they continued their work and finished it before mid-day. A considerable body of foot was then landed at the foot of Bunker's Hill, under the command of Generals Howe and Pigot; the former being appointed to attack the lines, and the latter the redoubt. The Americans, however, having the advantage of the ground, as well as of their intrenchments, poured down such incessant volleys as threatened the whole body with destruction; and General Howe was for a little time left almost alone, all his officers being killed or wounded. The

provincials in the mean time had taken possession of Charlestown, so that General Pigot was obliged to contend with them in that place as well as in the redoubt. The consequence was, that he was over-matched; his troops were thrown into disorder; and he would in all probability have been defeated, had not General Clinton advanced to his relief: upon which the attack was renewed with such fury, that the provincials were driven beyond the neck that leads to Charlestown. In the heat of the engagement the British troops were obliged to set fire to the town of Charlestown, which quickly obliged the provincials to yield after they were deprived of that shelter. The loss on the British side amounted to about 1000, among whom were 19 officers killed and 70 wounded; that of the Americans did not exceed 500.

The British troops claimed the victory in this engagement with justice, though it must be allowed that it was dearly bought; and the Americans boasted that the real advantages were on their side, as they had so much weakened the enemy that they durst not afterwards venture out of their entrenchments. From the many advantages, however, which the Americans possessed, it is evident that the greatest display of valour was on the side of their enemies. The former were strongly entrenched, and most of their fortifications cannon proof; their soldiers were all chosen, and excellent marksmen, to whom muskets ready loaded were handed as fast as they were discharged; and when one party was wearied, another came to their assistance, as was perceived by the spectators on the tops of the houses at Boston. Considering, however, that this was the first time the provincials had been in actual service, it must be owned that they behaved with great spirit, and by no means merited the appellation of *cowards*, with which they were so often branded in Britain.

In other places the same determined spirit of resistance appeared on the part of the Americans. Lord North's conciliatory scheme was utterly rejected by the assemblies of Pennsylvania and New Jersey, and afterwards in every other colony. The commencement of hostilities at Lexington determined the colony of New-York, which had hitherto continued to waver, to unite with the rest; and as the situation of New-York renders it unable to resist an attack from the sea, it was resolved, before the arrival of a British fleet, to secure the military stores, send off the women and children, and to set fire to the city if it was still found incapable of defence. The exportation of provisions was every where prohibited, particularly to the British fishery on the banks of Newfoundland, or to such colonies of America as should adhere to the British interest. Congress resolved on the establishment of an army, and of a large paper-currency in order to support it. In the inland northern colonies, Colonels Easton and Ethan Allen, without receiving any orders from Congress, or communicating their design to any body, with a party of only 250 men, surprised the forts of Crown Point, Ticonderago, and the rest that form a communication betwixt the colonies and Canada. On this occasion 200 pieces of cannon fell into their hands, besides a large quantity of military stores, together with two armed vessels, and materials for the construction of others.

America.

After the battle of Bunker's Hill, the provincials erected fortifications on the heights which commanded Charlestown, and strengthened the rest in such a manner that there was no hope of driving them from thence; at the same time that their activity and boldness astonished the British officers, who had been accustomed to entertain too mean an opinion of their courage.

192
Troops in
Boston dis-
tressed.

The troops, thus shut up in Boston, were soon reduced to distress. Their necessities obliged them to attempt the carrying off the American cattle on the islands before Boston, which produced frequent skirmishes; but the provincials, better acquainted with the navigation of these shores, landed on the islands, destroyed or carried off whatever was of any use, burned the light-house at the entrance of the harbour, and took prisoners the workmen sent to repair it, as well as a party of marines who guarded them. Thus the garrison were reduced to the necessity of sending out armed vessels to make prizes indiscriminately of all that came in their way, and of landing in different places to plunder for subsistence as well as they could.

193
Articles of
union be-
twixt the
colonies.

The congress in the mean time continued to act with all the vigour which its constituents had expected. Articles of confederation and perpetual union were drawn up and solemnly agreed upon; by which they bound themselves and their posterity for ever. These were in substance as follows:

1. Each colony was to be independent within itself, and to retain an absolute sovereignty in all domestic affairs.
2. Delegates to be annually elected to meet in congress, at such time and place as should be enacted in the preceding congress.
3. This assembly should have the power of determining war or peace, making alliances; and in short all that power which sovereigns of states usually claim as their own.
4. The expences of war to be paid out of the common treasury, and raised by a poll-tax on males between 16 and 60; the proportions to be determined by the laws of the colony.
5. An executive council to be appointed to act in place of the congress during its recess.
6. No colony to make war with the Indians without consent of congress.
7. The boundaries of all the Indian lands to be secured and ascertained to them; and no purchases of lands were to be made by individuals, or even by a colony, without consent of congress.
8. Agents appointed by congress should reside among the Indians, to prevent frauds in trading with them, and to relieve, at the public expence, their wants and distresses.
9. This confederation to last until there should be a reconciliation with Britain; or, if that event should not take place, it was to be perpetual.

194
Declaration
on taking
up arms.

After the action of Bunker's Hill, however, when the power of Great Britain appeared less formidable in the eyes of America than before, congress proceeded formally to justify their proceedings in a declaration drawn up in terms more expressive, and well calculated to excite attention.

"Were it possible (said they) for men who exercise their reason, to believe that the divine Author of
No 15.

our existence intended a part of the human race to hold an absolute property in and unbounded power over others, marked out by His infinite goodness and wisdom as the objects of a legal domination, never right-fully resistible, however severe and oppressive; the inhabitants of these colonies might at least require from the parliament of Great Britain some evidence that this dreadful authority over them had been granted to that body: but a reverence for our Great Creator, principles of humanity, and the dictates of common sense, must convince all those who reflect upon the subject, that government was instituted to promote the welfare of mankind, and ought to be administered for the attainment of that end.

"The legislature of Great Britain, however, stimulated by an inordinate passion for power, not only unjustifiable, but which they know to be peculiarly reprobated by the very constitution of that kingdom; and despairing of success in any mode of contest where regard should be had to law, truth, or right; have at length, deserting those, attempted to effect their cruel and impolitic purpose of enslaving these colonies by violence, and have thereby rendered it necessary for us to close with their last appeal from reason to arms. Yet, however blinded that assembly may be, by their intemperate rage for unlimited domination, so to slight justice in the opinion of mankind, we esteem ourselves bound by obligations to the rest of the world to make known the justice of our cause."

After taking notice of the manner in which their ancestors left Britain, the happiness attending the mutual friendly commerce betwixt that country and her colonies, and the remarkable success of the late war, they proceed as follows: "The new ministry finding the brave foes of Britain, though frequently defeated, yet still contending, took up the unfortunate idea of granting them a hasty peace, and of then subduing her faithful friends.

"These devoted colonies were judged to be in such a state as to prevent victories without bloodshed, and all the easy emoluments of statutable plunder. The uninterrupted tenor of their peaceable and respectful behaviour from the beginning of their colonization; their dutiful, zealous, and useful services during the war, though so recently and amply acknowledged in the most honourable manner by his Majesty, by the late king, and by parliament, could not save them from the intended innovations. Parliament was influenced to adopt the pernicious project; and assuming a new power over them, has in the course of eleven years given such decisive specimens of the spirit and consequences attending this power, as to leave no doubt of the effects of acquiescence under it.

"They have undertaken to give and grant our money without our consent, though we have ever exercised an exclusive right to dispose of our own property. Statutes have been passed for extending the jurisdiction of the courts of admiralty and vice-admiralty beyond their ancient limits; for depriving us of the accustomed and inestimable rights of trial by jury, in cases affecting both life and property; for suspending the legislature of one of our colonies; for interdicting all commerce to the capital of another; and for altering fundamentally the form of government established by charter, and secured by acts of its own legislature; and

Americas.

America. and solemnly confirmed by the crown; for exempting the murderers of colonists from legal trial, and in effect from punishment; for erecting in a neighbouring province, acquired by the joint arms of Great Britain and America, a despotism dangerous to our very existence; and for quartering soldiers upon the colonists in time of a profound peace. It has also been resolved in parliament, that colonists charged with committing certain offences, shall be transported to England to be tried.

“But why should we enumerate our injuries in detail?—By one statute it was declared, that parliament can of right make laws to bind us in all cases whatever. What is to defend us against so enormous, so unlimited a power? Not a single person who assumes it is chosen by us, or is subject to our control or influence; but on the contrary, they are all of them exempt from the operation of such laws; and an American revenue, if not diverted from the ostensible purposes from which it is raised, would actually lighten their own burdens in proportion as it increases ours.

“We saw the misery to which such despotism would reduce us. We for ten years incessantly and ineffectually besieged the throne as supplicants; we reasoned, we remonstrated with parliament in the most mild and decent language; but administration, sensible that we should regard these measures as freemen ought to do, sent over fleets and armies to enforce them.

“We have pursued every temperate, every respectful measure; we have even proceeded to break off all commercial intercourse with our fellow-subjects as our last peaceable admonition, that our attachment to no nation on earth would supplant our attachment to liberty: this we flattered ourselves was the ultimate step of the controversy; but subsequent events have shown how vain was this hope of finding moderation in our enemies!

“The Lords and Commons, in their address in the month of February, said, that a rebellion at that time actually existed in the province of Massachusetts Bay; and that those concerned in it had been countenanced and encouraged by unlawful combinations and engagements entered into by his Majesty’s subjects in several of the colonies; and therefore they besought his Majesty that he would take the most effectual measures to enforce due obedience to the laws and authority of the supreme legislature. Soon after the commercial intercourse of whole colonies with foreign countries was cut off by an act of parliament; by another, several of them were entirely prohibited from the fisheries in the seas near their coasts, on which they always depended for their subsistence; and large reinforcements of ships and troops were immediately sent over to General Gage.

“Fruitless were all the intreaties, arguments, and eloquence of an illustrious band of the most distinguished peers and commoners, who nobly and strenuously asserted the justice of our cause, to stay, or even to mitigate, the heedless fury with which these accumulated outrages were hurried on. Equally fruitless was the interference of the city of London, of Bristol, and many other respectable towns in our favour.”

After having reproached parliament, General Gage, and the British government in general, they proceed thus: “We are reduced to the alternative of choosing an unconditional submission to tyranny or resistance by

force. The latter is our choice. We have counted the cost of this contest, and find nothing so dreadful as voluntary slavery. Honour, justice, and humanity, forbid us tamely to surrender that freedom which we received from our gallant ancestors, and which our innocent posterity have a right to receive from us. Our cause is just; our union is perfect; our internal resources are great; and, if necessary, foreign assistance is undoubtedly attainable. We fight not for glory or conquest; we exhibit to mankind the remarkable spectacle of a people attacked by unprovoked enemies. They boast of their privileges and civilization, and yet proffer no milder conditions than servitude or death. In our own native land, in defence of the freedom that is our birthright, for the protection of our property acquired by the honest industry of our forefathers and our own, against violence actually offered, we have taken up arms; we shall lay them down when hostilities shall cease on the part of our aggressors, and all danger of their being renewed shall be removed,—and not before.”

These are some of the most striking passages in the declaration of congress on taking up arms against Great Britain, and dated July 6th 1775. Without inquiring whether the principles on which it is founded are right or wrong, the determined spirit which it shows, ought to have convinced us, that the conquest of America was an event scarce ever to be expected. In every other respect an equal spirit was shown; and the rulers of the British nation had the mortification to see those whom they styled *rebels* and *traitors*, succeed in negotiations in which they themselves were utterly foiled. In the passing of the Quebec-bill, ministry had flattered themselves that the Canadians would be so much attached to them on account of restoring the French laws, that they would very readily join in any attempt against the colonists who had reprobated that bill in such strong terms: but in this, as in every thing else indeed, they found themselves mistaken. The Canadians having been subject to Britain for a period of 15 years, and being thus rendered sensible of the superior advantages of British government, received the bill itself with evident marks of disapprobation; nay, reprobated it as tyrannical and oppressive. A scheme had been formed for General Carleton, governor of the province, to raise an army of Canadians wherewith to act against the Americans; and so sanguine were the hopes of administration in this respect, that they had sent 20,000 stand of arms, and a great quantity of military stores, to Quebec for the purpose. But the people, though they did not join the Americans, yet were found immoveable in their purpose to stand neuter. Application was made to the bishop; but he declined to interpose his influence, as contrary to the rules of the Popish clergy: so that the utmost efforts of government in this province were found to answer little or no purpose.

The British administration next tried to engage the Indians in their cause. But though agents were dispersed among them with large presents to the chiefs, they universally replied, that they did not understand the nature of the quarrel, nor could they distinguish whether those who dwelt in America or on the other side of the ocean were in fault: but they were surpris'd to see Englishmen ask their assistance

America. against one another; and advised them to be reconciled, and not think of shedding the blood of their brethren. —To the representations of congress they paid more respect. These set forth, that the English on the other side of the ocean had taken up arms to enslave not only their countrymen in America, but the Indians also; and if the latter should enable them to overcome the colonists, they themselves would soon be reduced to a state of slavery also. By arguments of this kind these savages were engaged to remain neuter; and thus the colonists were freed from a most dangerous enemy. On this occasion the congress thought proper to hold a solemn conference with the different tribes of Indians. The speech made by them on the occasion is curious, but too long to be fully inserted. The following is a specimen of the European mode of addressing these people.

197
Speech of
the com-
missioners
from con-
gress to the
Indians.

“ Brothers, Sachems, and Warriors !

“ We, the delegates from the Twelve United Provinces, now sitting in general congress at Philadelphia, send their talk to you our brothers.

“ Brothers and Friends, now attend !

“ When our fathers crossed the great water, and came over to this land, the king of England gave them a talk, assuring them that they and their children should be his children; and that if they would leave their native country, and make settlements, and live here, and buy and sell, and trade with their brethren beyond the water, they should still keep hold of the same covenant-chain, and enjoy peace; and it was covenanted, that the fields, houses, goods, and possessions, which our fathers should acquire, should remain to them as their own, and be their childrens for ever, and at their sole disposal.

“ Brothers and Friends, open a kind ear !

“ We will now tell you of the quarrel betwixt the counsellors of King George and the inhabitants and colonies of America.

“ Many of his counsellors have persuaded him to break the covenant-chain, and not to send us any more good talks. They have prevailed upon him to enter into a covenant against us; and have torn asunder, and cast behind their backs, the good old covenant which their ancestors and ours entered into, and took strong hold of. They now tell us they will put their hands into our pocket without asking, as though it were their own; and at their pleasure they will take from us our charters, or written civil constitution, which we love as our lives; also our plantations, our houses, and goods, whenever they please, without asking our leave. They tell us, that our vessels may go to that or this island in the sea, but to this or that particular island we shall not trade any more; and in case of our non-compliance with these new orders, they shut up our harbours.

“ Brothers, we live on the same ground with you; the same island is our common birth-place. We desire to sit down under the same tree of peace with you: let us water its roots, and cherish the growth, till the large leaves and flourishing branches shall extend to the setting sun, and reach the skies. If any thing disagreeable should ever fall out between us, the Twelve United Colonies, and you, the Six Nations, to wound our peace, let us immediately seek measures for heal-

ing the breach. From the present situation of our affairs, we judge it expedient to kindle up a small fire at Albany, where we may hear each other's voice, and disclose our minds fully to one another.”

The other remarkable transactions of this congress were the ultimate refusal of the conciliatory proposal made by Lord North, of which such sanguine expectations had been formed by the English ministry; and appointing a generalissimo to command their armies, which were now very numerous. The person chosen for this purpose was George Washington: a man so universally beloved, that he was raised to such a high station by the unanimous voice of congress; and his subsequent conduct showed him every way worthy of it. Horace Gates and Charles Lee, two English officers of considerable reputation, were also chosen; the former an adjutant-general, the second a major-general. Artemus Ward, Philip Schuyler, and Israel Putnam, were likewise nominated major-generals. Seth Pomeroy, Richard Montgomery, David Wooster, William Heath, Joseph Spencer, John Thomas, John Sullivan, and Nathaniel Green, were chosen brigadier-generals at the same time.

in chief.

Congress had now also the satisfaction to receive deputies from the colony of Georgia, expressing a desire to join the confederacy. The reasons they gave for renouncing their allegiance to Britain was, that the conduct of parliament towards the other colonies had been oppressive; that though the obnoxious acts had not been extended to them, they could view this only as an omission, because of the seeming little consequence of their colony; and therefore looked upon it rather to be a slight than a favour. At the same time they framed a petition to the King, similar to that sent by the other colonies, and which met with a similar reception.

199
Georgia ac-
cedes to the
confedera-
cy.

The success which had hitherto attended the Americans in all their measures, now emboldened them to think not only of defending themselves, but likewise of acting offensively against Great Britain. The conquest of Canada appeared an object within their reach, and one that would be attended with many advantages; and as an invasion of that province was already facilitated by the taking of Crown Point and Ticonderoga, it was resolved if possible to penetrate that way into Canada, and reduce Quebec during the winter, before the fleets and armies which they were well assured would fail thither from Britain should arrive. By order of congress, therefore, 3000 men were put under the command of Generals Montgomery and Schuyler, with orders to proceed to Lake Champlain, from whence they were to be conveyed in flat-bottomed boats to the mouth of the river Sorel, a branch of the great river St Lawrence, and on which is situated a fort of the same name with the river. On the other hand, they were opposed by General Carleton governor of Canada, a man of great activity and experience in war; who, with a very few troops, had hitherto been able to keep in awe the disaffected people of Canada, notwithstanding all the representations of the colonists. He had now augmented his army by a considerable number of Indians, and promised even in his present situation to make a very formidable resistance.

200
The Ame-
ricans at-
tempt the
conquest of
Canada.

As soon as General Montgomery arrived at Crown Point,

²⁰¹ America. Point, he received information that several armed vessels were stationed at St John's, a strong fort on the Sorel, with a view to prevent his crossing the lake; on which he took possession of an island which commands the mouth of the Sorel, and by which he could prevent them from entering the lake. In conjunction with General Schuyler, he next proceeded to St John's: but finding that place too strong, he landed on a part of the country considerably distant, and full of woods and swamps. From thence, however, they were driven by a party of Indians whom General Carleton had employed.

The provincial army was now obliged to retreat to the island of which they had at first taken possession; where General Schuyler being taken ill, Montgomery was left to command alone. His first step was to gain over the Indians whom Gen. Carleton had employed, and this he in a great measure accomplished; after which, on receiving the full number of troops appointed for his expedition, he determined to lay siege to St John's. In this he was facilitated by the reduction of Chamblee, a small fort in the neighbourhood, where he found a large supply of powder. An attempt was made by General Carleton to relieve the place; for which purpose he with great pains collected about 1000 Canadians, while Colonel Maclean proposed to raise a regiment of the Highlanders who had emigrated from their country to America.

²⁰² Gen. Carleton defeated. But while Gen. Carleton was on his march with these new levies, he was attacked by a superior force of provincials, and utterly defeated; which being made known to another body of Canadians who had joined Colonel Maclean, they abandoned him without striking a blow, and he was obliged to retreat to Quebec.

The defeat of General Carleton was a sufficient recompence to the Americans for that of Colonel Ethan Allen, which had happened some time before. The success which had attended this gentleman against Crown Point and Ticonderago had emboldened him to make a similar attempt on Montreal; but being attacked by the militia of the place, supported by a detachment of regulars, he was entirely defeated and taken prisoner.

²⁰³ St John's fort taken. As the defeat of General Carleton and the desertion of Maclean's forces left no room for the garrison of St John's to hope for any relief, they now consented to surrender themselves prisoners of war; but were in other respects treated with great humanity. They were in number 500 regulars and 200 Canadians, among whom were many of the French nobility, who had been very active in promoting the cause of Britain among their countrymen.

General Montgomery next took measures to prevent the British shipping from passing down the river from Montreal to Quebec. This he accomplished so effectually, that the whole were taken. The town itself was obliged to surrender at discretion; and it was with the utmost difficulty that General Carleton escaped in an open boat by the favour of a dark night.

²⁰⁴ And likewise Montreal. No further obstacle now remained in the way of the Americans to the capital, except what arose from the nature of the country; and these indeed were very considerable. Nothing, however, could damp the ardour of the provincials. Notwithstanding it was now the

middle of November, and the depth of winter was at hand, Colonel Arnold formed a design of penetrating through woods, morasses, and the most frightful solitudes from New England to Canada by a nearer way than that which Montgomery had chosen; and this he accomplished in spite of every difficulty, to the astonishment of all who saw or heard of the attempt. This desperate march, however, cannot be looked upon as conducive to any good purpose. A third part of his men under another colonel had abandoned him by the way, under pretence of want of provisions; the total want of artillery rendered his presence insignificant before a place strongly fortified; and the smallness of his army rendered it even doubtful whether he could have taken the town by surprise. The Canadians indeed were amazed at the exploit, and their inclination to revolt from Britain was somewhat augmented; but none of them as yet took up arms in behalf of America. The consternation into which the town of Quebec was thrown proved detrimental rather than otherwise to the expedition; as it doubled the vigilance and activity of the inhabitants to prevent any surprise; and the appearance of common danger united all parties, who, before the arrival of Arnold, were contending most violently with one another. He was therefore obliged to content himself with blocking up the avenues to the town, in order to distress the garrison for want of provisions; and even this he was unable to do effectually, by reason of the small number of his men.

The matter was not much mended by the arrival of General Montgomery. The force he had with him, even when united to that of Arnold, was too insignificant to attempt the reduction of a place so strongly fortified, especially with the assistance only of a few mortars and field-pieces. After the siege had continued through the month of December, General Montgomery, conscious that he could accomplish his end no other way than by surprise, resolved to make an attempt on the last day of the year 1775. The method he took at this time was perhaps the best that human wisdom could devise. He advanced by break of day, in the midst of an heavy fall of snow, which covered his men from the sight of the enemy. Two real attacks were made by himself and Colonel Arnold, at the same time that two feigned attacks were made on two other places, thus to distract the garrison, and make them divide their forces. One of the real attacks was made by the people of New York, and the other by those of New England under Arnold. Their hopes of surprising the place, however, were defeated by the signal for the attack being through some mistake given too soon. General Montgomery himself had the most dangerous place, being obliged to pass between the river and some high rocks on which the Upper Town stands; so that he was forced to make what haste he could to close with the enemy. His fate, however, was now decided. Having forced the first barrier, a violent discharge of musketry and grape-shot from the second killed him, his principal officers, and the most of the party he commanded; on which those who remained immediately retreated. Colonel Arnold in the mean time made a desperate attack on the Lower Town, and carried one of the barriers after an obstinate resistance for an hour; but in the action he himself received

^{America.} received a wound, which obliged him to withdraw. The attack, however, was continued by the officers whom he had left, and another barrier forced: but the garrison, now perceiving that nothing was to be feared except from that quarter, collected their whole force against it; and, after a desperate engagement of three hours, overpowered the provincials, and obliged them to surrender.

In this action, it must be confessed that the valour of the provincial troops could not be exceeded. They had fought under as great disadvantages as those which attended the British at Bunker's Hill, and had behaved equally well. Such a terrible disaster left no hope remaining of the accomplishment of their purpose, as General Arnold could now scarce number 800 effective men under his command. He did not, however, abandon the province, or even remove to a greater distance than three miles from Quebec; and here he still found means to annoy the garrison very considerably by intercepting their provisions. The Canadians, notwithstanding the bad success of the American arms, still continued friendly; and thus he was enabled to sustain the hardships of a winter encampment in that most severe climate. The congress, far from passing any censure on him for his misfortune, created him a brigadier-general.

208
Arnold created a Brigadier-General.

209
Disputes of Lord Dunmore with his province of Virginia.

While hostilities were thus carried on with vigour in the north, the flame of contention was gradually extending itself in the south. Lord Dunmore, the governor of Virginia, was involved in disputes similar to those which had taken place in other colonies. These had proceeded so far that the assembly was dissolved; which in this province was attended with a consequence unknown to the rest. As Virginia contained a great number of slaves, it was necessary that a militia should be kept constantly on foot to keep them in awe. During the dissolution of the assembly the militia-laws expired; and the people, after complaining of the danger they were in from the negroes, formed a convention, which enacted that each county should raise a quota for the defence of the province. Dunmore, on this, removed the powder from Williamsburg; which created such discontents, that an immediate quarrel would probably have ensued, had not the merchants of the town undertaken to obtain satisfaction for the injury supposed to be done to the community. This tranquillity, however, was soon interrupted; the people, alarmed by a report that an armed party were on their way from the man of war where the powder had been deposited, assembled in arms, and determined to oppose by force any farther removals. In some of the conferences which passed at this time, the governor let fall some unguarded expressions, such as threatening them with setting up the royal standard, proclaiming liberty to the negroes, destroying the town of Williamsburg, &c. which were afterwards made public, and exaggerated in such a manner as greatly to increase the public ferment.

The people now held frequent assemblies. Some of them took up arms with a design to force the governor to restore the powder, and to take the public money into their own possession: but on their way to Williamsburg for this purpose, they were met by the receiver-general, who became security for the payment

of the gun-powder, and the inhabitants promised to take ^{America.} care of the magazine and public revenue.

By this insurrection the governor was so much intimidated, that he sent his family on board a man of his family aboard a man of war. He himself, however, issued a proclamation, in which he declared the behaviour of the person who promoted the tumult treasonable, accused the people of disaffection, &c. On their part they were by no means deficient in recriminating; and some letters of his to Britain being about the same time discovered, consequences ensued extremely similar to those which had been occasioned by those of Mr Hutchinson at Boston.

In this state of confusion the governor thought it ²¹¹ necessary to fortify his palace with artillery, and procure a party of marines to guard it. Lord North's conciliatory proposal arriving also about the same time, he used his utmost endeavours to cause the people comply with it. The arguments he used were such as must do him honour; and had not matters already gone to such a pitch of distraction, it is highly probable that some attention would have been paid to them. "The view (he said) in which the colonies ought to behold this conciliatory proposal, was no more than an earnest admonition from Great Britain to relieve her wants: that the utmost condescendence had been used in the mode of application; no determinate sum having been fixed, as it was thought most-worthy of British generosity to take what they thought could be conveniently spared, and likewise to leave the mode of raising it to themselves," &c. But the clamour and dissatisfaction were now so universal, that nothing else could be attended to. The governor had called an assembly for the purpose of laying this conciliatory proposal before them; but it had been little attended to. The assembly began their session by inquiries into the state of the magazine. It had been broken into by some of the townsmen; for which reason spring-guns had been placed there by the governor, which discharged themselves upon the offenders at their entrance: these circumstances, with others of a similar kind, raised such a violent uproar, that as soon as the preliminary business ²¹² of the session was over, the governor retired on board a man of war, informing the assembly that he durst no longer trust himself on shore. This produced a long course of disputation, which ended in a positive refusal of the governor to trust himself again in Williamsburg, even to give his assent to the bills, which could not be passed without it, and though the assembly offered to bind themselves for his personal safety. In his turn he requested them to meet him on board the man of war, where he then was; but this proposal was rejected, and all further correspondence containing the least appearance of friendship was discontinued.

Lord Dunmore, thus deprived of his government, ²¹³ attempted to reduce by force those whom he could no longer govern. Some of the most strenuous adherents to the British cause, whom their zeal had rendered obnoxious at home, now repaired to him. He was also joined by numbers of black slaves. With these, and the assistance of the British shipping, he was for some time enabled to carry on a kind of predatory war sufficient to hurt and exasperate, but not to subdue. After some inconsiderable attempts on land, proclaiming

America. ing liberty to the slaves, and setting up the royal standard, he took up his residence at Norfolk, a maritime town of some consequence, where the people were better affected to Britain than in most other places. A considerable force, however, was collected against him; and the natural impetuosity of his temper prompting him to act against them with more courage than caution, he was entirely defeated, and obliged to retire to his shipping, which was now crowded by the number of those who had incurred the resentment of the provincials.

Cruelty of the Americans.

219
The town of Norfolk destroyed.

220
The governors of South and North Carolina expelled.

In the mean time a scheme of the utmost magnitude and importance was formed by one Mr Conolly, a Pennsylvanian of an intrepid and aspiring disposition, and attached to the cause of Britain. The first step of this plan was to enter into a league with the Ohio Indians. This he communicated to Lord Dunmore, and it received his approbation: Upon which Conolly set out, and actually succeeded in his design. On his return he was dispatched to General Gage, from whom he received a colonel's commission, and set out in order to accomplish the remainder of his scheme. The plan in general was, that he should return to the Ohio, where, by the assistance of the British and Indians in these parts, he was to penetrate through the back-settlements into Virginia, and join Lord Dunmore at Alexandria. But by an accident very naturally to be expected, he was discovered, taken prisoner, and thrown into a dungeon.

After the retreat of Lord Dunmore from Norfolk, that place was taken possession of by the provincials, who treated the loyalists that had remained there with great cruelty; at the same time that they greatly distressed those on board Lord Dunmore's fleet, by refusing to supply them with any necessaries. Nor was this all; the vicinity of the shipping was so great as to afford the riflemen an opportunity of aiming at the people on board, and exercising the cruel occupation of killing them, in which they did not fail every day to employ themselves. These proceedings at last drew a remonstrance from his Lordship; in which he insisted that the fleet should be furnished with necessaries, and that the soldiers should desist from the cruel diversion above-mentioned; but both these requests being denied, a resolution was taken to set fire to the town. After giving the inhabitants proper warning, a party landed, under cover of a man of war, and set fire to that part which lay nearest the shore; but the flames were observed at the same time to break forth in every other quarter, and the whole town was reduced to ashes. This universal destruction, by which a loss of more than L. 300,000 was incurred, is said to have been occasioned by order of the congress itself, that the loyalists might find no refuge there for the future.

In the southern colonies of Carolina the governors were expelled and obliged to take refuge on board of men of war, as Lord Dunmore had been; Mr Martin, governor of North Carolina, on a charge of attempting to raise the back-settlers, consisting chiefly of Scots Highlanders, against the colony. Having secured themselves against any attempts from these enemies, however, they proceeded to regulate their internal concerns in the same manner as the rest of the colonies; and by the end of the year 1775, Britain beheld the whole of America united against her in the most determined opposition.

Her vast possessions of that tract of land (since known by the name of the *Thirteen United States*) were now reduced to the single town of Boston; in which her forces were besieged by an enemy with whom they were apparently not able to cope, and by whom they must of course expect in a very short time to be expelled. The situation of the inhabitants of Boston, indeed, was peculiarly unhappy. After having failed in their attempts to leave the town, general Gage had consented to allow them to retire with their effects; but afterwards, for what reason does not well appear, he refused to fulfil his promise. When he resigned his place to general Howe in October 1775, the latter, apprehensive that they might give intelligence of the situation of the British troops, strictly prohibited any person from leaving the place under pain of military execution. Thus matters continued till the month of March 1776, when the town was evacuated.

America.
221
Miserable situation of the inhabitants of Boston.

On the 2d of that month, General Washington opened a battery on the west side of the town, from whence it was bombarded with a heavy fire of cannon at the same time; and three days after, it was attacked by another battery from the eastern shore. This terrible attack continued for 14 days without intermission; when General Howe, finding the place no longer tenible, determined if possible to drive the enemy from their works. Preparations were therefore made for a most vigorous attack, on an hill called Dorchester Neck, which the Americans had fortified in such a manner as would in all probability have rendered the enterprize next to desperate. No difficulties, however, were sufficient to daunt the spirit of the general; and every thing was in readiness, when a sudden storm prevented this intended exertion of British valour. Next day, upon a more close inspection of the works they were to attack, it was thought advisable to desist from the enterprize altogether. The fortifications were very strong, and extremely well provided with artillery; and besides other implements of destruction, upwards of 100 hogheads of stones were provided to roll down upon the enemy as they came up; which, as the ascent was extremely steep, must have done prodigious execution.

222
Boston severely cannonaded by the provincials.

Nothing therefore now remained but to think of a retreat; and even this was attended with the utmost difficulty and danger. The Americans, however, knowing that it was in the power of the British general to reduce the town to ashes, which could not have been repaired in many years, did not think proper to give the least molestation; and for the space of a fortnight the troops were employed in the evacuation of the place, from whence they carried along with them 2000 of the inhabitants, who durst not stay on account of their attachment to the British cause. From Boston they failed to Halifax; but all their vigilance could not prevent a number of valuable ships from falling into the hands of the enemy. A considerable quantity of cannon and ammunition had also been left at Bunker's Hill and Boston Neck; and in the town, an immense variety of goods, principally woollen and linen, of which the provincials stood very much in need. The estates of those who fled to Halifax were confiscated; as also those who were attached to government, and had remained in the town. As an attack was expected as soon as the British forces should arrive, every method

was employed to render the fortifications, already very strong, impregnable. For this purpose some foreign engineers were employed, who had before arrived at Bolton; and so eager were people of all ranks to accomplish this business, that every able-bodied man in the place, without distinction of rank, set apart two days in the week, to complete it the sooner.

The Americans, exasperated to the utmost by the proceedings of parliament, now formally renounced all connection with Britain, and declared themselves independent. This celebrated declaration was published on the 4th of July 1776. Previous to this a circular letter had been sent through each colony, stating the reasons for it; and such was the animosity now every where prevailing against Great Britain, that it met with universal approbation, except in the province of Maryland alone. It was not long, however, before the people of that colony, finding themselves left in a very dangerous minority, thought proper to accede to the measures of the rest. The manifesto itself was much in the usual style, stating a long list of grievances, for which redress had been often applied in vain; and for these reasons they determined on a final separation; to hold the people of Britain as the rest of mankind, "enemies in war, in peace friends."

After thus publicly throwing off all allegiance and hope of reconciliation, the colonists soon found that an exertion of all their strength was required in order to support their pretensions. Their arms, indeed, had not, during this season, been attended with success in Canada. Reinforcements had been promised to Colonel Arnold, who still continued the blockade of Quebec; but they did not arrive in time to second his operations. Being sensible, however, that he must either desist from the enterprize, or finish it successfully, he recommenced in form; attempting to burn the shipping, and even to storm the town itself. They were unsuccessful, however, by reason of the smallness of their number, though they succeeded so far as to burn a number of houses in the suburbs; and the garrison were obliged to pull down the remainder, in order to prevent the fire from spreading.

As the provincials, though unable to reduce the town, kept the garrison in continual alarms, and in a very disagreeable situation, some of the nobility collected themselves into a body under the command of one Mr Beaujeu, in order to relieve their capital; but they were met on their march by the provincials, and so entirely defeated, that they were never afterwards able to attempt any thing. The Americans, however, had but little reason to plume themselves on this success. Their want of artillery at last convinced them, that it was impracticable in their situation to reduce a place so strongly fortified: the small-pox at the same time made its appearance in their camp, and carried off great numbers; intimidating the rest to such a degree, that they deserted in crowds. To add to their misfortunes, the British reinforcements unexpectedly appeared, and the ships made their way through the ice with such celerity, that the one part of their army was separated from the other; and General Carleton falling out as soon as the reinforcement was landed, obliged them to fly with the utmost precipitation, leaving behind them all their cannon and military stores; at the same time that their shipping was

entirely captured by vessels sent up the river for that purpose. On this occasion the provincials fled with such precipitation that they could not be overtaken; so that none fell into the hands of the British excepting the sick and wounded. General Carleton now gave a signal instance of his humanity: Being well apprised that many of the provincials had not been able to accompany the rest in their retreat, and that they were concealed in woods, &c. in a very deplorable situation, he generously issued a proclamation, ordering proper persons to seek them out, and give them relief at the public expence; at the same time lest, through fear of being made prisoners, they should refuse these offers of humanity, he promised that, as soon as their situation enabled them, they should be at liberty to depart to their respective homes.

The British general, now freed from any danger of an attack, was soon enabled to act offensively against the provincials, by the arrival of the forces destined for that purpose from Britain. By these he was put at the head of 12,000 regular troops, among whom were those of Brunswick. With this force he instantly set out to the Three Rivers, where he expected that Arnold would have made a stand; but he had fled to So-rel, a place 150 miles distant from Quebec, where he was at last met by the reinforcements ordered by congress. Here, though the preceding events were by no means calculated to inspire much military ardour, a very daring enterprize was undertaken; and this was, to surprise the British troops posted here under General Frazer and Nesbit; of whom the former commanded those on land, the latter such as were on board of transports and were but a little way distant. The enterprize was undoubtedly very hazardous, both on account of the strength of the parties against whom they were to act, and as the main body of the British forces were advanced within 50 miles of the place; besides that a number of armed vessels and transports with troops lay between them and the Three Rivers. Two thousand chosen men, however, under General Thomson, engaged in this enterprize. Their success was by no means answerable to their spirit and valour. Though they passed the shipping without being observed, General Frazer had notice of their landing; and thus being prepared to receive them, they were soon thrown into disorder, at the same time that General Nesbit, having landed his forces, prepared to attack them in the rear. On this occasion some field-pieces did prodigious execution, and a retreat was found to be unavoidable. General Nesbit, however, had got between them and their boats; so that they were obliged to take a circuit through a deep swamp, while they were hotly pursued by both parties at the same time, who marched for some miles on each side of the swamp, till at last the miserable provincials were sheltered from further danger by a wood at the end of the swamp. Their general, however, was taken, with 200 of his men.

By this disaster the provincials lost all hopes of accomplishing any thing in Canada. They demolished their works, and carried off their artillery with the utmost expedition. They were pursued, however, by General Burgoyne; against whom it was expected that they would have collected all their force, and made a resolute stand. But they were now too much dispirited

^{America.} ed by misfortune, to make any further exertions of valour. On the 18th of June the British general arrived at Fort St John's, which he found abandoned and burnt. Chamblee had shared the same fate, as well as all the vessels that were not capable of being dragged up against the current of the river. It was thought that they would have made some resistance at Nut Island, the entrance to Lake Champlain; but this also they had abandoned, and retreated across the lake to Crown Point, whither they could not be immediately followed. Thus was the province of Canada entirely evacuated by the Americans; whose loss in their retreat from Quebec was not calculated at less than 1000 men, of whom 400 fell at once into the hands of the enemy at a place called the Cedars, about 50 miles above Montreal. General Sullivan, however, who conducted this retreat after the affair of General Thomson, was acknowledged to have had great merit in what he did, and received the thanks of congress accordingly.

rection in
North Ca-
rolina in
favour of
Britain.

This bad success in the north, however, was somewhat compensated by what happened in the southern colonies.—We have formerly taken notice that Mr Martin, governor of North Carolina, had been obliged to leave his province and take refuge on board a man of war. Notwithstanding this, he did not despair of reducing it again to obedience. For this purpose he applied to the Regulators, a daring set of banditti, who lived in a kind of independent state; and though considered by government as rebels, yet had never been molested, on account of their numbers and known skill in the use of fire-arms. To the chiefs of these people commissions were sent, in order to raise some regiments; and Colonel Macdonald, a brave and enterprising officer, was appointed to command them. In the month of February he erected the king's standard, issued proclamations, &c. and collected some forces, expecting to be soon joined by a body of regular troops, who were known to be shipped from Britain to act against the southern colonies. The Americans, sensible of their danger, dispatched immediately what forces they had to act against the royalists, at the same time that they diligently exerted themselves to support these with suitable reinforcements. Their present force was commanded by a General Moore, whose numbers were inferior to Macdonald; for which reason the latter summoned him to join the king's standard under pain of being treated as a rebel. But Moore, being well provided with cannon, and conscious that nothing could be attempted against him, returned the compliment, by acquainting Colonel Macdonald, that if he and his party would lay down their arms, and subscribe an oath of fidelity to congress, they should be treated as friends; but if they persisted in an undertaking for which it was evident they had not sufficient strength, they could not but expect the severest treatment. In a few days General Moore found himself at the head of 8000 men, by reason of the continual supplies which daily arrived from all parts. The royal party amounted only to 2000, and they were destitute of artillery, which prevented them from attacking the enemy while they had the advantage of numbers. They were now therefore obliged to have recourse to a desperate exertion of personal valour; by dint of which they effected a retreat for 80 miles to Moore's Creek, within 16 miles of Wilmington. Could they have gained this

place, they expected to have been joined by Governor ^{America.} Martin and General Clinton, who had lately arrived with a considerable detachment. But Moore with his army pursued them so close, that they were obliged to attempt the passage of the Creek itself, though a considerable body of the enemy, under the command of Colonel Coswell, with fortifications well planted with cannon, was posted on the other side. On attempting the Creek, however, it was found not to be fordable. They were obliged therefore to cross over a wooden bridge, which the provincials had not time to destroy entirely. They had, however, by pulling up part of the planks, and greasing the remainder in order to render them slippery, made the passage so difficult, that the royalists could not attempt it. In this situation they were, on the 27th of February, attacked by Moore with his superior army, and totally defeated with the loss of their general and most of their leaders, as well as the best and bravest of their men.

²³⁵
The roy-
alists entire-
ly defeated.

Thus was the power of the provincials established in North Carolina. Nor were they less successful in the province of Virginia; where Lord Dunmore, having long continued an useless predatory war, was at last driven from every creek and road in the province. The people he had on board were distressed to the highest degree by confinement in small vessels. The heat of the season, and the numbers crowded together, produced a pestilential fever, which made great havoc, especially among the blacks. At last, finding themselves in the utmost hazard of perishing by famine as well as disease, they set fire to the least valuable of their vessels, reserving only about 50 for themselves, in which they bid a final adieu to Virginia, some sailing to Florida, some to Bermuda, and the rest to the West Indies.

²³⁶
Lord Dun-
more final-
ly driven

ginia.

In South Carolina the provincials had a more formidable enemy to deal with. A squadron, whose object was the reduction of Charlestown, had been fitted out in December 1775; but by reason of unfavourable weather did not reach Cape Fear in North Carolina till the month of May 1776: and here it met with further obstacles till the end of the month. Thus the Americans, always noted for their alertness in raising fortifications, had time to strengthen those of Charlestown in such a manner as rendered it extremely difficult to be attacked. The British squadron consisted of two 50 gun ships, four of 30 guns, two of 20, an armed schooner and bomb-ketch; all under the command of Sir Peter Parker. The land forces were commanded by Lord Cornwallis, with Generals Clinton and Vaughan. As they had yet no intelligence of the evacuation of Boston, General Howe dispatched a vessel to Cape Fear with some instructions; but it was too late; and in the beginning of June the squadron anchored off Charlestown bar. Here they met with some difficulty in crossing, being obliged to take out the guns from the two large ships, which were, notwithstanding, several times in danger of sticking fast. The next obstacle was a strong fort on Sullivan's island, six miles east from Charlestown; which, though not completely finished, was very strong. However, the British generals resolved without hesitation to attack it; but though an attack was easy from the sea, it was very difficult to obtain a co-operation of the land forces. This was attempted by landing them on

mament
sent against
Charles-
town.

Long

^{America.} Long Island, adjacent to Sullivan's island on the east, from which it is separated by a very narrow creek, said not to be above two feet deep at low water. Opposite to this ford the provincials had posted a strong body of troops, with cannon and intrenchments; while General Lee was posted on the main land, with a bridge of boats betwixt that and Sullivan's island, so that he could at pleasure send reinforcements to the troops in the fort on Sullivan's island.

On the part of the British, so many delays occurred, that it was the 28th of June before matters were in readiness for an attack; and by this time the provincials had abundantly provided for their reception. On the morning of that day the bomb-ketch began to throw shells into Fort Sullivan, and about mid-day the two 50 gun ships and 30 gun frigates came up and began a severe fire. Three other frigates were ordered to take their station between Charlestown and the fort, in order to enfilade the batteries, and cut off the communication with the main land; but through the ignorance of the pilots they all stuck fast; and though two of them were disentangled, they were found to be totally unfit for service: the third was burnt, that she might not fall into the hands of the enemy.

Captain
Morris.

²⁴⁰
The Bri-
tish repul-
sed.

The attack was therefore confined to the five armed ships and bomb-ketch, between whom and the fort a dreadful fire ensued. The Bristol suffered excessively. The springs on her cable being shot away, she was for some time entirely exposed to the enemy's fire. As the enemy poured in great quantities of red-hot balls, she was twice in flames. The captain (Mr Morris) after receiving five wounds, was obliged to go below deck in order to have his arm amputated. After undergoing this operation he returned to his place, where he received another wound, but still refused to quit his station; at last he received a red-hot ball in his belly, which instantly put an end to his life. Of all the officers and seamen who stood on the quarter-deck of this vessel, not one escaped without a wound excepting Sir Peter Parker alone; whose intrepidity and presence of mind on this occasion was very remarkable. The engagement lasted till darkness put an end to it. Little damage was done by the British, as the works of the enemy lay so low that many of the shot flew over; and the fortifications, being composed of palm-trees mixed with earth, were extremely well calculated to resist the impression of cannon. During the height of the attack, the provincial batteries remained for some time silent, so that it was concluded that they had been abandoned; but this was found to proceed only from want of powder; for as soon as a supply of this necessary article was obtained, the firing was resumed as brisk as before. During the whole of this desperate engagement it was found impossible for the land-forces to give the least assistance to the fleet. The enemy's works were found to be much stronger than they had been imagined, and the depth of water effectually prevented them from making any attempt. In this unsuccessful attack the killed and wounded on the part of the British amounted to about 200. The Bristol and Experiment were so much damaged, that it was thought they could not have been got over the bar; however, this was at last accomplished by a very great exertion of naval skill, to the surprize of the provincials, who had expected to make them both prizes.

Nº 15.

On the American side the loss was judged to have been very considerable, as most of their guns were dismounted, and reinforcements had poured into the fort during the whole time of the action.

^{America.}

This year also, the Americans, having so frequently made trial of their valour by land, became desirous of trying it by sea also, and of forming a navy that might in some measure be able to protect their trade, and do essential hurt to the enemy. In the beginning of March Commodore Hopkins was dispatched with five frigates to the Bahama islands, where he made himself master of the ordnance and military stores; but the gunpowder, which had been the principal object, was removed. On his return he captured several vessels; but was foiled in his attempt on the Glasgow frigate, which found means to escape notwithstanding the efforts of his whole squadron.

²⁴¹
Americans
form a
navy.

The time, however, was now come when the fortitude and patience of the Americans were to undergo a severe trial. Hitherto they had been on the whole successful in their operations: but now they were doomed to experience misfortune, misery, and disgrace; the enemy over-running their country, and their own armies not able to face them in the field. The province of New York, as being the most central colony, and most accessible by sea, was pitched upon for the object of the main attack. The force sent against it consisted of 6 ships of the line, 30 frigates, besides other armed vessels, and a vast number of transports. The fleet was commanded by Lord Howe, and the land forces by his brother General Howe, who was now at Halifax. The latter, however, a considerable time before his brother arrived, had set sail from Halifax, and lay before New York, but without attempting to commence hostilities until he should be joined by his brother. The Americans had, according to custom, fortified New York and the adjacent islands in an extraordinary manner. However, General Howe was suffered to land his troops on Staten Island, where he was soon joined by a number of the inhabitants. About the middle of July, Lord Howe arrived with the grand armament; and being one of the commissioners appointed to receive the submission of the colonists, he published a circular letter to this purpose to the several governors who had lately been expelled from their provinces, desiring them to make the extent of his commission, and the powers he was invested with by parliament, as public as possible. Here, however, congress saved him trouble, by ordering his letter and declaration to be published in all the newspapers, that every one, as they said, might see the insidiousness of the British ministry, and that they had nothing to trust to besides the exertion of their own valour.

Lord Howe next sent a letter to General Washington; but as it was directed "To George Washington, Esq;" the General refused to accept of it, as not being directed in the style suitable to his station. To obviate this objection, Adjutant-general Pateron sent with another letter, directed "To George Washington, &c. &c. &c." But though a very polite reception was given to the bearer, General Washington utterly refused the letter; nor could any explanation of the Adjutant induce him to accept of it. The only interesting part of the conversation was that relating to the powers of the commissioners, of which Lord Howe

America. was one. The adjutant told him, that these powers were very extensive; that the commissioners were determined to exert themselves to the utmost, in order to bring about a reconciliation; and that he hoped the general would consider this visit as a step towards it. General Washington replied, that it did not appear that these powers consisted in any thing else than granting pardons; and as America had committed no offence, she asked no forgiveness, and was only defending her unquestionable rights.

245
Hostilities commence.

The decision of every thing being now by consent of both parties left to the sword, no time was lost, but hostilities commenced as soon as the British troops could be collected. This, however, was not done before the month of August; when they landed without any opposition on Long Island, opposite to the shore of Staten Island. General Putnam, with a large body of troops, lay encamped and strongly fortified on a peninsula on the opposite shore, with a range of hills between the armies, the principal pass of which was near a place called *Flat-bush*. Here the centre of the British army, consisting of Hessians, took post; the left wing, under General Grant, lying near the shore; and the right, consisting of the greater part of the British forces, lay under Lord Percy, Cornwallis, and General Clinton. Putnam had ordered the passes to be secured by large detachments, which was executed as to those at hand; but one of the utmost importance, that lay at a distance, was entirely neglected. This gave an opportunity to a large body of troops under Lord Percy and Clinton to pass the mountains and attack the Americans in the rear, while they were engaged with the Hessians in front. Through this piece of negligence their defeat became inevitable. Those who were engaged with the Hessians first perceived their mistake, and began a retreat towards their camp; but the passage was intercepted by the British troops, who drove them back into the woods. Here they were met by the Hessians; and thus were they for many hours slaughtered between the two parties, no way of escape remaining but by breaking through the British troops, and thus regaining their camp. In this attempt many perished; and the right wing, engaged with General Grant, shared the same fate. The victory was complete; and the Americans lost on this fatal day (August 27th) between 3000 and 4000 men, of whom 2000 were killed in the battle or pursuit. Among these a regiment, consisting of young gentlemen of fortune and family in Maryland, was almost entirely cut in pieces, and of the survivors not one escaped without a wound.

247
The Americans defeated with great slaughter.

The ardour of the British troops was now so great, that they could scarce be restrained from attacking the lines of the provincials; but for this there was now no occasion, as it was certain they could not be defended. Of the British only 61 were killed in this engagement, and 257 wounded. Eleven hundred of the enemy, among whom were three generals, were taken prisoners.

248
They abandon their camp in the night.

As none of the American commanders thought it proper to risk another attack, it was resolved to abandon their camp as soon as possible. Accordingly on the night of the 29th of August, the whole of the continental troops were ferried over with the utmost secrecy and silence; so that in the morning the British had

nothing to do but take possession of the camp and artillery which they had abandoned.

America.

This victory, though complete, was very far from being so decisive as the conquerors imagined. Lord Howe, supposing that it would be sufficient to intimidate the congress into some terms, sent general Sullivan, who had been taken prisoner in the late action, to congress, with a message, importing, that though he could not consistently treat with them as a legal assembly, yet he would be very glad to confer with any of the members in their private capacity; setting forth at the same time the nature and extent of his powers as commissioner. But the congress were not as yet sufficiently humbled to derogate in the least from the dignity of character they had assumed. They replied, that the congress of the free and independent states of America could not consistently send any of its members in another capacity than that which they had publicly assumed; but as they were extremely desirous of restoring peace to their country upon equitable conditions, they would appoint a committee of their body to wait upon him, and learn what proposals he had to make.

249
Lord Howe sends a message to congress,

250
And is waited on by a committee.

This produced a new conference. The committee appointed by congress was composed of Dr Franklin, Mr Adams, and Mr Rutledge. They were very politely received by his Lordship; but the conference proved as fruitless as before independency had been declared; and the final answer of the deputies was, that they were extremely willing to enter into any treaty with Great Britain that might conduce to the good of both nations, but that they would not treat in any other character than that of independent states. This positive declaration instantly put an end to all hopes of reconciliation; and it was resolved to prosecute the war with the utmost vigour. Lord Howe, after publishing a manifesto, in which he declared the refusal of congress, and that he himself was willing to confer with all well disposed persons about the means of restoring public tranquillity, set about the most proper methods for reducing the city of New York. Here the provincial troops were posted, and from a great number of batteries kept continually annoying the British shipping. The East River lay between them, of about 1200 yards in breadth, which the British troops were extremely desirous of passing. At last the ships having, after an incessant cannonade of several days, silenced the most troublesome batteries, a body of troops was sent up the river to a bay, about three miles distant, where the fortifications were less strong than in other places. Here having driven off the provincials by the cannon of the fleet, they marched directly towards the city; but the enemy finding that they should now be attacked on all sides, abandoned the city, and retired to the north of the island, where their principal force was collected. In their passage thither they skirmished with the British, but carefully avoided a general engagement; and it was observed that they did not behave with that ardour and impetuous valour which had hitherto marked their character.

251
The conference terminates ineffectually.

252
New York abandoned by the provincials.

The British and provincial armies were not now above two miles distant from each other. The former lay encamped from shore to shore for an extent of two miles, being the breadth of the island, which though 15 miles long, exceeds not two in any part in breadth. The provincials, who lay directly opposite, had strengthened

253
Situation of the British and American armies.

America. ened their camp with many fortifications; at the same time, being masters of all the passes and defiles betwixt the two camps, they were enabled to defend themselves against an army much more numerous than their own; and they had also strongly fortified a pass called *King's Bridge*, whence they could secure a passage to the continent in case of any misfortune. Here general Washington, in order to inure the provincials to actual service, and at the same time to annoy the enemy as much as possible, employed his troops in continual skirmishes; by which it was observed that they soon recovered their spirits, and behaved with their usual boldness.

254
New York
set on fire
by the pro-
vincials.

As the situation of the two armies was now highly inconvenient for the British generals, it was resolved to make such movements as might oblige general Washington to relinquish his strong situation. The possession of New York had been less beneficial than was expected. It had been concerted among the provincials, that the city should be burnt at the time of evacuation; but as they were forced to depart with precipitation, they were prevented from putting the scheme in execution. In a few days, however, it was attempted by some who had been left behind for that purpose. Taking advantage of a high wind and dry weather, the town was set on fire in several places at once, by means of combustibles properly placed for that purpose; and notwithstanding the most active exertions of the soldiery and sailors, a fourth part of the city was consumed.

255
General
Washington
obliged
to move far-
ther from
New York.

On this occasion the British were irritated to the highest degree; and many persons, said to be incendiaries, were without mercy thrown into the flames. It was determined to force the provincial army to a greater distance, that they might have it less in their power, by any emissaries, to engage others in a similar attempt. For this purpose, general Howe having left Lord Percy with sufficient force to garrison New York, he embarked his army in flat-bottomed boats, by which they were conveyed thro' the dangerous passage called *Hell-Gate*, and landed near the town of West Chester, lying on the continent towards Connecticut. Here having received a supply of men and provisions, they moved to New Rochelle, situated on the sound which separates Long Island from the continent. After this, receiving still fresh reinforcements, they made such movements as threatened to distress the provincials very much, by cutting off their convoys of provisions from Connecticut, and thus force them to an engagement. This, however, General Washington determined at all events to avoid. He therefore extended his forces into a long line opposite to the way in which the enemy marched, keeping the Bruua, a river of considerable magnitude, between the two armies, with the North River on his rear. Here again the provincials continued for some time to annoy and skirmish with the Royal army, until at last, by some other manœuvres, the British general found means to attack them advantageously at a place called the *White Plains*, and drove them from some of their posts. The victory on this occasion was much less complete than the former; however it obliged the provincials once more to shift their ground, and to retreat farther up the country. General Howe pursued for some time; but at last finding all his endeavours vain to bring the Americans to a pitched battle, he determined to give over such an useless chace,

256
Is defeated
at the
White
Plains.

and employ himself in reducing the forts which the provincials still retained in the neighbourhood of New York. In this he met with the most complete success. The Americans, on the approach of the king's forces, retreated from King's Bridge into Fort Washington; and this, as well as Fort Lee, which lay in the neighbourhood, was quickly reduced, though the garrison made their escape. Thus the Jerseys were laid entirely open to the incursions of the British troops; and so fully were these provinces taken possession of by the Royal army, that its winter-quarters extended from New Brunswick to the river Delaware. Had any number of boats been at hand, it is probable that Philadelphia would now have fallen into their hands. All these, however, had been carefully removed by the Americans. In lieu of this enterprize, Sir Henry Clinton undertook an expedition to Rhode-Island, and became master of it without losing a man. His expedition was also attended with this further advantage, that the American fleet under commodore Hopkins was obliged to sail as far as possible up the river Providence, and thus remained entirely useless.

Island ta-
ken.

The same ill success continued to attend the Americans in other parts. After their expulsion from Canada, they had crossed the lake Champlain, and taken up their quarters at Crown Point, as we have already mentioned. Here they remained for some time in safety, as the British had no vessels on the lake, and consequently general Burgoyne could not pursue them. To remedy this deficiency, there was no possible method, but either to construct vessels on the spot, or take to pieces some vessels already constructed, and drag them up the river into the lake. This, however, was effected in no longer a space than three months; and the British general, after incredible toil and difficulty, saw himself in possession of a great number of vessels, by which means he was enabled to pursue his enemies, and invade them in his turn. The labour undergone at this time by the sea and land forces must indeed have been prodigious; since there were conveyed over land, and dragged up the rapids of St Laurence, no fewer than 30 large long-boats, 400 batteaux, besides a vast number of flat-bottomed boats, and a gondola of 30 tons. The intent of the expedition was to push forward before winter to Albany, where the army would take up its winter-quarters, and next spring effect a junction with that under general Howe, when it was not doubted that the united force and skill of these two commanders would speedily put a termination to the war.

259
The British
convey ves-
sels up the
lake Cham-
plain.

By reason of the difficulties with which the equipment of this fleet had been attended, it was the beginning of October before the expedition could be undertaken. It was now, however, by every judge allowed to be completely able to answer the purpose for which it was intended. It consisted of one large vessel with three masts, carrying 18 twelve-pounders; two schooners, the one carrying 14, the other 12 six-pounders; a large flat-bottomed radeau with 6 twenty-four and 6 twelve-pounders; and a gondola with 8 nine-pounders. Besides these were 20 vessels of a smaller size, called *gun-boats*, carrying each a piece of brass ordnance from nine to 24 pounders, or howitzers. Several long-boats were fitted out in the same manner; and besides all these, there was a vast number of boats and tenders

of

America. of various sizes, to be used as transports for the troops and baggage. It was manned by a number of select seamen, and the guns were to be served by a detachment from the corps of artillery; the officers and soldiers appointed for this expedition were also chosen out of the whole army.

260
Destroy the naval force of the provincials.

To oppose this formidable armament the Americans had only a very inconsiderable force, commanded by general Arnold; who, after engaging part of the British fleet for a whole day, took advantage of the darkness of the night to set sail without being perceived, and next morning was out of sight: but he was shortly pursued by the British, that on the second day after he was overtaken, and forced to a second engagement. In this he behaved with great gallantry; but his force being very inferior to that of the enemy, he was obliged to run his ships ashore and set them on fire. A few only escaped to lake George; and the garrison of Crown Point having destroyed or carried off every thing of value, retired to Ticonderoga. Thither general Carleton intended to have pursued them; but the difficulties he had to encounter appeared so many and so great, that it was thought proper to march back into Canada, and desist from any further operations till next spring.

261
The Americans almost entirely dispersed.

Thus the affairs of the Americans seemed every where going to wreck: even those who had been most sanguine in their cause began to waver. The time, also, for which the soldiers had enlisted themselves was now expired; and the bad success of the preceding campaign had been so very discouraging, that no person was willing to engage himself during the continuance of a war, of which the event seemed to be so doubtful. In consequence of this, therefore, General Washington found his army daily decreasing in strength; so that from 30,000, of whom it consisted when general Howe landed on Staten Island, scarce a tenth-part could now be mustered. To assist the chief commander as much as possible, general Lee had collected a body of forces in the north; but on his way southward, having imprudently taken up his lodging at some distance from his troops, information was given to colonel Harcourt, who happened at that time to be in the neighbourhood, and Lee was made prisoner. The loss of this general was much regretted, the more especially as he was of superior quality to any prisoner in the possession of the colonists, and could not therefore be exchanged. Six field-officers were offered in exchange for him and refused; and the congress was highly irritated at its being reported that he was to be treated as a deserter, having been a half-pay officer in the British service at the commencement of the war. In consequence of this they issued a proclamation, threatening to retaliate on the prisoners in their possession whatever punishment should be inflicted on any of those taken by the British, and especially that their conduct should be regulated by the treatment of general Lee.

162
General Lee taken prisoner.

263
Continental army for 1777.

In the mean time they proceeded with the most indefatigable diligence to recruit their army, and bound their soldiers to serve for a term of three years, or during the continuance of the war. The army designed for the ensuing campaign, was to consist of 88 battalions; of which each province was to contribute its quota; and 20 dollars were offered as a bounty to

America. each soldier, besides an allotment of lands at the end of the war. In this allotment it was stipulated, that each soldier should have 100 acres; an ensign 150; a lieutenant 200; a captain 300; a major 400; a lieutenant-colonel 450; and a colonel 500. No lands were promised to those who enlisted only for three years. All officers or soldiers disabled through wounds received in the service were to enjoy half-pay during life. To defray the expence, congress borrowed five millions of dollars at five per cent.; for payment of which the United States became surety. At the same time, in order to animate the people to vigorous exertions, a declaration was published, in which they set forth the necessity there was for taking proper methods to insure success in their cause: they endeavoured to palliate as much as possible the misfortunes which had already happened; and represented the true cause of the present distress to be the short term of enlistment.

This declaration, together with the imminent danger of Philadelphia, determined the Americans to exert themselves to the utmost in order to reinforce general Washington's army. They soon received farther encouragement, however, by an exploit of that general against the Hessians. As the Royal army extended in different cantonments for a great way, general Washington, perceiving the imminent danger to which Philadelphia was exposed, resolved to make some attempt on those divisions of the enemy which lay nearest that city. These happened to be the Hessians, who lay in three divisions, the last only 20 miles distant from Philadelphia. On the 25th of December, having collected as considerable a force as he could, he set out with an intent to surprize that body of the enemy who lay at Trenton. His army was divided into three bodies; one of which he ordered to cross the Delaware at Trenton Ferry, a little below the town; the second at a good distance below, at a place called *Bordentown*, where the second division of Hessians was placed; while he himself, with the third, directing his course to a ferry some miles above Trenton, intended to have passed it at midnight, and attack the Hessians at break of day. But by reason of various impediments, it was eight in the morning before he could reach the place of his destination. The enemy, however, did not perceive his approach till they were suddenly attacked. Colonel Ralle, who commanded them, did all that could be expected from a brave and experienced officer; but every thing was in such confusion, that no efforts of valour or skill could now retrieve matters. The Colonel himself was mortally wounded, his troops were entirely broken, their artillery seized, and about 1000 taken prisoners.

This action, though seemingly of no very decisive nature, was sufficient at that time to turn the fortune of war in favour of America. It tended greatly to lessen the fear which the provincials had of the Hessians, at the same time that it equally abated the confidence which the British had till now put in them. Reinforcements came into General Washington's army from all quarters; so that he was soon in a condition to leave Philadelphia, and take up his quarters at Trenton. Emboldened by his success, he determined to make an attempt on a division of the British forces stationed at Maidenhead, a town situated half way between Trenton and Princetown. This consisted of three regiments

264
Another attempt on three British regiments;

²⁶⁵ **America:** under the command of Colonel Mawhood, an officer of great merit. The troops were surpris'd on their march; but though they were separately surrounded and attacked by a force so vastly superior, they charged the enemy so resolutely with their bayonets, that they effected a retreat. These attempts of the Americans, however, with the hostile disposition of the people, showed the impossibility of maintaining posts so far advanced in the enemy's country; so that it was resolv'd to retreat towards Brunswick, in order to prevent it, with the troops and magazines it contained, from falling into the hands of the provincials. General Washington lost no opportunity of recovering what had been lost; and by dividing his army into small parties, which could be reunited on a few hours warning, he in a manner entirely covered the country with it, and repossest himself of all the important places.

²⁶⁶ **Excursions of the British from New York.**

Thus ended the campaign of 1776, with scarce any real advantage other than the acquisition of the city of New York, and of a few fortresses in its neighbourhood; where the troops were constrained to act with as much circumspection as if they had been besieged by a victorious army, instead of being themselves the conquerors.

The army at New York began in 1777 to exercise a kind of predatory war, by sending out parties to destroy magazines, make incursions, and take or destroy such forts as lay on the banks of rivers, to which their great command of shipping gave them access. In this they were generally successful: the provincial magazines at Peek's Hill, a place of about 50 miles distant from New York, were destroyed, the town of Dunbury in Connecticut burnt, and that of Ridgefield in the same province was taken possession of. In returning from the last expedition, however, the British were greatly harassed by the enemy under Generals Arnold, Wooster, and Sullivan; but they made good their retreat in spite of all opposition, with the loss of only 170 killed and wounded. On the American side the loss was much greater; General Wooster was killed, and Arnold in the most imminent danger. On the other hand, the Americans destroyed the stores at Sagg-harbour, in Long-Island, and made prisoners of all who defended the place.

²⁶⁷ **General Prescott taken prisoner.**

As this method of making war, however, could answer but little purpose, and favoured more of the barbarous incursions of savages than of a war carried on by a civilized people, it was resolv'd to make an attempt on Philadelphia. At first it was thought that this could be done through the Jerseys; but General Washington had received such large reinforcements, and posted himself so strongly, that it was found to be impracticable. Many stratagems were used to draw him from this strong situation, but without success; so that it was found necessary to make the attempt on Philadelphia by sea. While the preparations necessary for this expedition were going forward, the Americans found means to make amends for the capture of General Lee by that of General Prescott, who was seized in his quarters with his aid de camp, in much the same manner as General Lee had been. This was exceedingly mortifying to the General himself, as he had not long before set a price upon General Arnold, by offering a sum of money to any one that apprehended

him; which the latter answered by setting a lower price upon General Prescott. **America.**

The month of July was far advanced before the preparations for the expedition against Philadelphia were completed; and it was the 23d before the fleet was able to sail from Sandy Hook. The force employed in this expedition consisted of 36 battalions of British and Hessians, a regiment of light horse, and a body of loyalists raised at New York. The remainder of these, with 17 battalions, and another body of light horse, were stationed at New York under Sir Henry Clinton. Seven battalions were stationed at Rhode Island. After a week's sailing they arrived at the mouth of the Delaware; but there received certain intelligence, that the navigation of the river was so effectually obstructed, that no possibility of forcing a passage remained. Upon this it was resolv'd to proceed further southward to Chesapeake Bay in Maryland, from whence the distance to Philadelphia was not very great, and where the provincial army would find less advantage from the nature of the country than in the Jerseys.

The navigation from Delaware to Chesapeake took up the best part of the month of August, and that up the bay itself was extremely difficult and tedious. At last, having sailed up the river Elk, as far as was practicable, the troops were landed without opposition, and set forward on their intended expedition. On the news of their arrival in Chesapeake, General Washington left the Jerseys, and hastened to the relief of Philadelphia; and in the beginning of September met the royal army at Brandy-wine Creek about mid-day, between the head of the Elk and Philadelphia. Here he adhered to his former method of skirmishing and harassing the royal army on its march; but as this proved insufficient to stop its progress, he retired to that side of the Creek next to Philadelphia, with an intent to dispute the passage. This brought on a general engagement on the 11th September, in which the Americans were worsted through the superior discipline of the British troops; and it was only through the approach of night that they were saved from being entirely destroyed. On this occasion the provincials lost about 1000 in killed and wounded, besides 400 taken prisoners. ²⁶⁸ **The fleet sails for Philadelphia.**

The loss of this battle proved also the loss of Philadelphia. General Washington retired towards Lancaster, an inland town, at a considerable distance from Philadelphia. Here, however, the British general took such measures as must have forced the provincials to a second engagement; but a violent rain which lasted a day and a night prevented his design. General Washington, though he could not prevent the loss of Philadelphia, still adhered to his original plan of distressing the royal party, by laying ambushes and cutting off detached parties; but in this he was less successful than formerly; and one of his own detachments which lay in ambush in a wood were themselves surpris'd and entirely defeated, with the loss of 300 killed and wounded, besides a great number taken, and all their arms and baggage. ²⁶⁹ **The army lands at the head of the Elk.**

General Howe now perceiving that the Americans would not venture another battle even for the sake of their capital, took peaceable possession of it on the 26th of September. His first care was then to cut off, by means of strong batteries, the communication ²⁷⁰ **Americans defeated.**

²⁷² **General Howe takes possession of Philadelphia.**

be-

America. between the upper and lower parts of the river; which was executed notwithstanding the opposition of some American armed vessels; one of which, carrying 36 guns, was taken. His next task was to open a communication with it by sea; and this was a work of no small difficulty. A vast number of batteries and forts had been erected, and immense machines formed like *chevaux de frize*, from whence they took their name, sunk in the river to prevent its navigation. As the fleet was sent round to the mouth of the river in order to co-operate with the army, this work, however difficult, was accomplished; nor did the provincials give much opposition, as well knowing that all places of this kind were now untenable. General Washington, however, took the advantage of the royal

ricans de-
feated.

army being divided to attack the camp of the principal division of it that lay at German-town in the neighbourhood of Philadelphia. In this he met with very little success; for though he reached the place of destination by three o'clock in the morning, the patrols had time to call the troops to arms. The Americans, notwithstanding, made a very resolute attack: but they were received with such bravery, that they were compelled to abandon the attempt, and retreat in great disorder; with the advantage, however, of carrying off their cannon, though pursued for a considerable way, after having 300 killed, 600 wounded, and upwards of 400 taken prisoners, among whom were 54 officers. On the British side, the loss amounted to 430 wounded and prisoners, and 70 killed; but among the last were General Agnew and Colonel Bird, with some other excellent officers.

There still remained two strong forts on the Delaware to be reduced. These were Mud Island and Red Bank. The various obstructions which the Americans had thrown in the way rendered it necessary to bring up the *Augusta*, a ship of the line, and the *Merlin* frigate, to the attack of Mud Island; but during the heat of action both were grounded. Upon this, the Americans sent down four fire-ships, and directed the whole fire from their galleys against them. The former were rendered ineffectual by the courage and skill of the British seamen; but during the engagement both the *Augusta* and *Merlin* took fire and were burnt to ashes, and the other ships obliged to withdraw. The enemy, encouraged by this unsuccessful attempt, proceeded to throw new obstructions in the way; but the British general having found means to convey a number of cannon and to erect batteries within a gunshot of the fort by land, and bringing up three ships of the line which mounted heavy cannon, the garrison, after making a vigorous defence for one day, perceiving that preparations were making for a general assault on the next, abandoned the place in the night. Those who defended Red Bank followed their example, and abandoned it on the approach of Lord Cornwallis. A great number of the American shipping now finding themselves entirely destitute of any protection, failed up the river in the night-time. Seventeen, however, remained, whose retreat was intercepted by a frigate and some armed vessels; on which the Americans ran them ashore and burnt them, to prevent their falling into the enemy's hands.

Thus the campaign of 1777 in Pennsylvania concluded successfully on the part of the British. In the

north, however, matters wore a different aspect. The expedition in that quarter had been projected by the British ministry as the most effectual method that could be taken to crush the colonies at once. The four provinces of New England had originally begun the confederacy against Britain, and were still considered as the most active in the continuation of it; and it was thought, that any impression made upon them would contribute in an effectual manner to the reduction of all the rest. For this purpose, an army of 4000 chosen British troops and 3000 Germans were put under the command of General Burgoyne; General Carleton was directed to use his interest with the Indians to persuade them to join in this expedition; and the province of Quebec was to furnish large parties to join in the same. The officers who commanded under General Burgoyne were General Philips of the artillery, Generals Frazer, Powell, and Hamilton, with the German officers Generals Reidefel and Speecht. The soldiers, as has already been observed, were all excellently disciplined, and had been kept in their winter-quarters with all imaginable care, in order to prepare them for the expedition on which they were going. To aid the principal expedition, another was projected on the Mohawk River under Colonel St Leger, who was to be assisted by Sir John Johnson, son to the famous Sir William Johnson who had so greatly distinguished himself in the war of 1755.

America.
277
Expedition
projected a-
gainst New
England.

On the 21st of June 1777, the army encamped on the western side of the Lake Champlain; where being joined by a considerable body of Indians, General Burgoyne made a speech, in which he exhorted these new allies to lay aside their ferocious and barbarous manner of making war; to kill only such as opposed them in arms; and to spare prisoners, with such women and children as should fall into their hands. After issuing a proclamation, in which the force of Britain and that which he commanded was set forth in very ostentatious terms, the campaign opened with the siege of Ticonderoga. The place was very strong, and garrisoned by 6000 men under General Sinclair; nevertheless, the works were so extensive, that even this number was scarce sufficient to defend them properly. They had therefore omitted to fortify a rugged eminence called *Sugar Hill*, the top of which overlooked and effectually commanded the whole works; vainly imagining that the difficulty of the ascent would be sufficient to prevent the enemy from taking possession of it. On the approach of the first division of the army, the provincials abandoned and set fire to their outworks; and so expeditious were the British troops, that by the 5th of July every post was secured which was judged necessary for investing it completely. A road was soon after made to the very summit of that eminence which the Americans had with such confidence supposed could not be ascended; and so much were they now disheartened, that they instantly abandoned the fort entirely, taking the road to Skenesborough, a place to the south of Lake George; while their baggage, with what artillery and military stores they could carry off, were sent to the same place by water. But the British generals were determined not to let them pass so easily. Both were pursued and both overtaken. Their armed vessels consisted only of five galleys; two of which were taken, and three blown up; on which they set fire to

America. their boats and fortifications at Skenesborough. On this occasion the provincials lost 200 boats, 130 pieces of cannon, with all their provisions and baggage. Their land-forces under Colonel Francis made a brave defence against General Frazer; and being greatly superior in number, had almost overpowered him, when General Reidesel with a large body of Germans came to his assistance. The enemy were now overpowered in their turn; and their commander being killed, they fled on all sides with great precipitation. In this action 200 Americans were killed, as many taken prisoners, and above 600 wounded, many of whom perished in the woods for want of assistance.

281 They are again defeated, and abandon Fort Anne.
During the engagement General Sinclair was at Castleton, about six miles from the place; but instead of going forward to Fort Anne, the next place of strength, he repaired to the woods which lie between that fortress and New England. General Burgoyne, however, detached Colonel Hill with the ninth regiment, in order to intercept such as should attempt to retreat towards Fort Anne. On his way he met with a body of the enemy, said to be six times as numerous as his own; but after an engagement of three hours, they were obliged to retire with great loss. After so many disasters, despairing of being able to make any stand at Fort Anne, they set fire to it and retired to Fort Edward. In all these engagements the loss of killed and wounded in the royal army did not exceed 200 men.

282 General Burgoyne makes his way to Fort Edward with great difficulty.
General Burgoyne was now obliged to suspend his operations for some time, and wait at Skenesborough for the arrival of his tents, provisions, &c. but employed this interval in making roads through the country about St Anne, and in clearing a passage for his troops to proceed against the enemy. This was attended with incredible toil; but all obstacles were surmounted with equal patience and resolution by the army. In short, after undergoing the utmost difficulty that could be undergone, and making every exertion that man could make, he arrived with his army before Fort Edward about the end of July. Here General Schuyler had been for some time endeavouring to recruit the shattered American forces, and had been joined by General Sinclair with the remains of his army; the garrison of Fort George also, situated on the lake of that name, had evacuated the place and retired to Fort Edward.

283 Americans retire to Saratoga.
But on the approach of the royal army, they retired from thence also, and formed their headquarters at Saratoga. Notwithstanding the great successes of the British general, they showed not the least disposition to submit, but seemed only to consider how they might make the most effectual resistance. For this purpose, the militia was every where raised and draughted to join the army at Saratoga; and such numbers of volunteers were daily added, that they soon began to recover from the terror into which they had been thrown. That they might have a commander whose abilities could be relied on, General Arnold was appointed, who repaired to Saratoga with a considerable train of artillery; but receiving intelligence that Colonel St Leger was proceeding with great rapidity in his expedition on the Mohawk River, he removed to Still-water, a place about half-way between Saratoga and the junction of the Mohawk and Hudson's River. The Colo-

nel, in the mean time, had advanced as far as Fort Stanwix; the siege of which he pressed with great vigour. On the 6th of August, understanding that a supply of provisions, escorted by 800 or 900 men, was on the way to the fort, he dispatched Sir John Johnson with a strong detachment to intercept it. This he did so effectually, that, besides intercepting the provisions, 400 of its guard were slain, 200 taken, and the rest escaped with great difficulty. The garrison, however, were not to be intimidated by this disaster, nor by the threats or representations of the Colonel: on the contrary, they made several successful sallies under Colonel Willet, the second in command; and this gentleman, in company with another, even ventured out of the fort, and, eluding the vigilance of the enemy, passed through them in order to hasten the march of General Arnold to their assistance.

284 Fort Stanwix besieged.
285 A detachment of Americans cut in pieces.
286 The Indians desert, and force the colonel to raise the siege.
Thus the affairs of Colonel St Leger seemed to be in no very favourable situation notwithstanding his late success, and they were soon totally ruined by the desertion of the Indians. They had been alarmed by the report of General Arnold's advancing with 2000 men to the relief of the fort; and while the Colonel was attempting to give them encouragement, another report was spread, that General Burgoyne had been defeated with great slaughter, and was now flying before the provincials. On this he was obliged to do as they thought proper; and the retreat could not be effected without the loss of the tents and some of the artillery and military stores.

287 General Burgoyne distressed for want of provisions.
288 Makes an attempt on the provincial magazines at Bennington.
General Burgoyne, in the mean time, notwithstanding all the difficulties he had already sustained, found that he must still encounter more. The roads he had made with so much labour and pains were destroyed either by the wetness of the season or by the enemy; so that the provisions he brought from Fort George could not arrive at his camp without the most prodigious toil. On hearing of the siege of Fort Stanwix by Colonel St Leger, he determined to move forward, in hopes of inclosing the enemy betwixt his own army and that of St Leger, or of obtaining the command of all the country between Fort Stanwix and Albany; or at any rate, a junction with Colonel St Leger would be effected, which could not but be attended with the most happy consequences. The only difficulty was the want of provisions; and this it was proposed to remedy by reducing the provincial magazines at Bennington. For this purpose, Colonel Baum, a German officer of great bravery, was chosen with a body of 500 men. The place was about 20 miles from Hudson's River; and to support Colonel Baum's party, the whole army marched up the river's bank, and encamped almost opposite to Saratoga, with the river betwixt it and that place. An advanced party was posted at Batten Kill, between the camp and Bennington, in order to support Colonel Baum. In their way the British seized a large supply of cattle and provisions, which were immediately sent to the camp; but the badness of the roads retarded their march so much, that intelligence of their design was sent to Bennington. Understanding now that the American force was greatly superior to his own, the Colonel acquainted the General, who immediately dispatched Colonel Breyman with a party to his assistance; but through the same causes that had retarded the march of Colonel Baum, this assist-

assistance could not arrive in time. General Starke, in the mean time, who commanded at Bennington, determined to attack the two parties separately; and for this purpose advanced against Colonel Baum, whom he surrounded on all sides and attacked with the utmost violence. The troops defended themselves with great valour, but were to a man either killed or taken. Colonel Breyman, after a desperate engagement, had the good luck to effect a retreat through the darkness of the night, which otherwise he could not have done, as his men had expended all their ammunition, being 40 rounds to each.
